The British system of measurement was also adopted by the following countries on the dates given: Denmark, 1867; Austria-Hungary, 1871; Germany, 1873; France, 1873; Italy, 1873; Spain, 1874; Sweden, 1875; Netherlands, 1876; Norway, 1876; Greece, 1878; Russia, 1879; Finland, 1877; Haiti, 1882; Belgium, 1884; Japan, 1884. In some of these the allowance of deductions, particularly that for propelling machinery, differs somewhat from the British rule. The regulations for the measurement of tonnage of vessels passing through the Panama Canal are similar to those for the Suez Canal. The deductions for space occupied by the propelling power and coal bunkers are made according to the so-called "Danube rule" and are considerably less than those provided by the United States, British, German, and French laws. The average difference of the two classes of measurement is about 10 per cent of the gross tonnage. See TONNAGE; PANAMA CANAL.

The most comprehensive and authoritative

treatise on the subject of the measurement of vessels is the report of Prof. Emory R. Johnson, of the Isthmian (Panama) Canal Commission. For further information, consult: *Instructions to Measuring Surveyors* (London, 1891); *Lloyd's Seaman's Almanac* (ib., 1893); *Revised Statutes of the United States*, sec. 4153; and the *Supplements to the Revised Statutes*, also the *Statutes at Large* for 1895. The *Instructions to Measuring Surveyors* gives all the British acts complete with instructions for carrying them into effect, definitions, etc.

MEASUREMENT OF BASE LINES. See GEODESY.

MEASURE OF DAMAGES. The rule of law determining the amount of money which a person whose rights have been infringed is entitled to recover from the wrongdoer as compensation or reparation for the wrong sustained. As damages technically covers only pecuniary compensation, the measure of damages does not include such remedies as the restitution of property, real or personal, which is unlawfully withheld from the one entitled thereto, nor the remedies peculiarly appropriate to equity, as injunction, account, foreclosure of mortgage, etc. The basis of the measure of damages is compensation, as closely as that can be arrived at, for the actual loss sustained by the injured party, but this is often difficult to estimate, as in actions for breach of promise to marry or for the alienation of the affections of a husband or wife, or in that numerous class of cases where mental suffering or injury to the feelings may be reckoned in assessing damages, as well as in cases of willful or malicious wrongdoing where vindictive or punitive damages may be awarded in addition to such as are purely compensatory. While the actual amount of the damages to be recovered in a given case usually rests in the discretion of the jury trying the question, the rules of law fixing the measure of damages which the jury is entitled to award are laid down by the court or judge. For a violation of the rule so prescribed, the verdict of the jury should be set aside and a new trial ordered. See CONTRACT; COURT; DAMAGES; JURY; TORT.

MEASURES. See WEIGHTS AND MEASURES.

MEASURING WORM. Any one of the larvæ of the lepidopterous superfamily Geometridæ, also called loopers. The group is a very extensive one and consists of fragile moths with comparatively large wings. The caterpillars are long and slender, with only one pair of abdominal feet placed upon the ninth segment of the body. There is also an anal pair of feet which function as claspers. The measuring worms walk by moving these two pairs of feet up to the thoracic legs, so that the body forms a large loop, giving the insect the appearance of measuring the surface upon which it is walking. It is this habit which has given the popular names "loopers," "inchworms," etc., and the scientific name Geometridæ to the insects of this group. Measuring worms feed upon the leaves of plants, with the exception of a few which bore into seeds. They are usually protectively colored so as to resemble twigs, and they have the attitude when at rest of holding the body stiff and erect at an angle from the main stem of the plant, so that they almost perfectly resemble twigs. The individuals of the same species vary in color during life, and with some species there is a well-marked dimorphism. In some species the dimorphism is

potential, and the future color is settled by some condition occurring during the early life of the larva. Poulton has made a careful study of the attitudes and colors of these larvæ, and rates the value of their protecting influence at a very high point. In one variable English species he states that the dark tint is due to pigment in the skin or immediately below it and the green color to a layer of fat between the hypodermis and the superficial muscles. In some geometrids the adult females are wingless. A marked example of this group is seen in the cankerworm moths of the United States. (See CANKERWORM.) The winter moth (*Cheimatobia brumata*), a species which is common and widespread in Europe and North America, has also a wingless female. One of the currant worms common to Europe and North America (*Eufitchia ribearia*) is a member of this group in which the female is fully winged.

Certain moths of the noctuid series exist whose larvæ lack certain of the middle prolegs and which therefore walk in a looping or measuring manner, but these are not true measuring worms. The cotton caterpillar (*Aletia xylinia*) is an example.

Packard, "A Monograph of the Geometrid Moths or Phalænidæ of the United States," in *Hayden's Annual Report of the United States Geological Survey*, vol. x (Washington, 1876); Edwards, *Standard Natural History*, vol. ii (Boston, 1884); David Sharp, *Cambridge Natural History*, vol. vi (London, 1899); J. H. and A. B. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, N. Y., 1909).

MEAT (AS. *mete*, Icel. *matr*, *mata*, Goth. *mats*, OHG. *maz*, meat, Ger. *Mass-leid*, aversion to meat). The flesh of animals used as food. Sometimes the word is restricted to the domestic animals, cattle, sheep, pigs, while the term "game" is applied to the flesh of wild animals, and "poultry" to the flesh of domestic fowl. The meat industry is one of very great importance. According to the most reliable data, there were in 1910 on farms and ranches in the United States over 40,000,000 cattle other than dairy cows. (This was only 82 per cent of the number reported in 1900, although this apparent fall was due in part to the fact that the census of 1910 was taken at an earlier date than that of 1900.) In 1909 there were slaughtered nearly 14,000,000 beef cattle, over 6,500,000 calves, 52,000,000 swine, more than 14,500,000 sheep, and some goats, the estimated weight of the dressed carcasses, including the lard of swine, being over 167,000,000 hundredweights.

Meat, i.e., flesh food, consists of the muscular tissue, or lean, and the varying quantities of fat which are found in the different parts of the carcass between and within membranes and tendons. Besides the fat ordinarily visible there is always present more or less of fat in particles too small to be readily distinguished from the lean which surrounds it. These particles can, however, be readily obtained by chemical methods in quantities sufficient to be seen and weighed. The lean part of the meat has practically the same final structure, regardless of its kind and source. All muscular tissue is made up of prism-shaped bundles, which can be divided into smaller and smaller bundles, until finally the muscle fibres or tubes are reached. These irregular tubes vary in diameter from $\frac{1}{200}$ to $\frac{1}{100}$ of an inch, and are therefore invisible to the

unaided eye. They are held together in bundles by means of connective tissue between and inside which the invisible fat is stored. The envelope or wall of each tube is a very delicate, elastic membrane, composed of nitrogenous material. The walls themselves are comparatively permanent, but their contents are continually undergoing change and renewal.

Meat is very commonly eaten fresh, but large quantities are also salted, smoked, dried, and canned. The meats found in the markets consist of the lean or muscular tissue, connective tissue, or gristle, fatty tissue, blood vessels, nerves, bone, etc. No general statement can be made with regard to the proportion in which these substances occur, as it is found to vary greatly with the kind of animal, with different cuts from the same animal, and with many other conditions. Nearly all meats bought and sold in the markets contain portions not suitable for eating, which may be properly designated as refuse.

Cuts of Meat. The methods of cutting carcasses of beef, veal, mutton, and pork into parts, and the terms used for the different cuts as these parts are commonly called, vary considerably in different localities. The figures for composition quoted below apply in general to cuts as indicated by the accompanying diagrams. These show the positions of the different cuts, both in the live animal and in the dressed carcass as found in the markets. The lines of division between the different cuts will vary slightly according to the usage of the local market, even where the general method of cutting is as here indicated. The names of the same cuts likewise vary in different parts of the country. Thus, the part nearest the ribs of beef is frequently called small end of loin or short steak. The other end of the loin is called hip sirloin or sirloin. Between the short and the sirloin is a portion quite generally called the tenderloin, for the reason that the real tenderloin, the very tender strip of meat lying inside the loin, is found most fully developed in this cut. "Porterhouse steak" is a term frequently applied to either the short steak or the tenderloin. It is not uncommon to find the

larger part of the flank and the rump is very frequently corned, or pickled in brine. In some markets the rump is cut so as to include a portion of the loin, which is then sold as rump steak. The portion of the round on the inside of the leg is regarded as more tender than that on the outside and is frequently preferred to the latter.

The general method of cutting up a side of beef is illustrated in Figs. 1 and 2, which show the relative positions of the cuts in the animal and in a dressed side.

The method of cutting up a side of veal differs considerably from that employed with beef. This is illustrated by Figs. 3 and 4, which show the relative positions of the cuts in the animal and in a dressed side.

Figs. 5 and 6 show the relative positions of the cuts in a dressed side of mutton or lamb and in a live animal.

The method of cutting up a side of pork differs considerably from that employed with other meats.

A large portion of the carcass of a dressed pig consists of almost clear fat. This furnishes the cuts which are used for salt pork and bacon. Figs. 7 and 8 illustrate a common method of cutting up pork, showing the relative positions of the cuts in the animal and in the dressed side. The hams and shoulders are more frequently cured, but are also sold as fresh pork steak. The tenderloin proper, which is not indicated in the figure, is a comparatively lean and very small strip of meat lying under the bones of the loin and usually weighing less than a pound. In cutting up pork some fat is usually trimmed off from the hams and shoulders, which is called ham and shoulder fat and is often used for sausages, etc. What is called leaf lard is made from the leaf fat of the peritoneum and the fat about the kidneys and along the belly.

The table on page 305 shows the average composition of a number of kinds and cuts of meat and also that of a number of meat products.

FIG. 2. DRESSED SIDE OF BEEF.

cuts. Judged by the averages of a large number of analyses, it ranges in beef from nothing in tenderloin to about 58 per cent in lean hind shank; in veal, nothing in flank to 63 per cent in medium-fat hind shank; in lamb, from 7 per cent in very fat hind leg to 20 per cent in shoulder; in mutton, from about 10 per cent in medium-fat flank to about 28 per cent in medium-fat neck; and in pork, from about 1 per cent in fresh lean ham to 68 per cent in the head. It would perhaps not be incorrect to say that, considering all meats, the refuse averages from 15 to 20 per cent of the material as purchased.

FIG. 4. DRESSED SIDE OF VEAL.

Digestibility. According to the results of a large number of experiments with beef, veal, mutton, and pork, at least 98 per cent of both the protein and the fat of meat is digested. No significant differences were

observed with different cuts or different methods of cooking.

Texture (Toughness) of Meats. Whether meats are tough or tender depends upon two

FIG. 5. DIAGRAM OF CUTS OF MUTTON OR LAMB IN THE LIVE ANIMAL.

1, neck; 2, chuck; 3, shoulder; 4, flank; 5, loin; 6, leg.

things—the character of the walls of the muscle tubes and the character of the connective tissues

which bind the tubes and muscles together. In young and well-nourished animals the tube walls are thin and delicate and the connective tissue is small in amount. As the animals grow older or are made to work (and this is particularly true in the case of poorly nourished animals) the walls of the muscle tubes and the connective tissues become thick and hard. This is the reason why the flesh of young, well-fed animals is tender and easily masticated, while the flesh of old, hard-worked, or poorly fed animals is often so tough that prolonged boiling or roasting seems to have but little effect on it.

After slaughtering, meats undergo marked changes in texture. These changes can be grouped under three classes or stages. In the first stage, when the meat is just slaughtered, the flesh is soft, juicy, and quite tender. In the next stage the flesh stiffens and the meat becomes hard and tough. This condition is known as *rigor mortis* and continues until the third stage, when the first changes of decomposition set in. In hot climates the meat is commonly eaten in either the first or second stage. In cold climates it is seldom eaten before the second stage, and generally, in order to lessen the toughness, it is allowed to enter the third stage, when it becomes soft and tender and acquires added flavor. The softening is due in part to the formation of lactic acid, which acts upon the connective tissue. The same effect may be produced, though more rapidly, by macerating the meat with weak vinegar. Meat is sometimes made tender by cutting the flesh into thin slices and pounding it across the cut ends until the fibres are broken.

The flavor depends largely upon the kinds and amounts of nitrogenous extractives which the muscle fibres or tubes contain. Pork and mutton are deficient in extractives, and what flavor they possess is due largely to the fats contained in them. The flesh of birds and of most game is very rich in extractives, which accounts for its high flavor. In general, the flavor of any particular meat is largely modified by the condition of the animal when slaughtered, and by its food, age, breed, etc. The flesh of young animals is more tender than, but not so highly flavored as, that of more mature animals. It is often said that the flesh of males is more highly flavored than that of females. There are at least two exceptions to this rule, since the flesh of the goose is more highly flavored than that of the gander, and in the case of pork there is little difference between the flesh of the male and that of the female. Castration, as illustrated in the familiar example of the capon, tends to make the flesh more tender, fatter, and better flavored. The flesh of the animals which feed exclusively upon fish or flesh has a strong, disagreeable taste, and is eaten only by uncivilized people or those in great need. Fish is an exception to the rule, however. Meat which is allowed to hang and ripen develops added flavors. In the first stages

FIG. 6. DRESSED SIDE OF MUTTON OR LAMB.

of decomposition compounds quite similar to the nitrogenous extractives are formed, and it is to these that the improved flavors are due.

Characteristics of Good Meat. Meat should have little or no odor and should be without any cadaveric smell characteristic of diseased or decomposing flesh. It should have a uniform color, neither abnormally pale nor inclined to purplish, and should be firm and elastic without pitting or

Cattle. The meat of steers, which animals furnish the prime grade of beef, is very light red and of fairly firm consistency, while the fat is also firm and white in color and so dispersed through the muscle bundles as to give the much-sought-for marbled appearance. The flesh of bulls is dark red, coarse, and stringy, and contains but small quantities of fat between the muscle fibres. In old cows the meat is tough, and the fat, which is principally deposited under the skin, is yellowish and not so firm in consistency. The carcasses of fat heifers are practically indistinguishable from the carcasses of steers.

Calves. This meat is very pale, being almost white in milk-fattened animals, but is rather tough, while the fat is reddish white shortly after slaughter, gradually changing to pure white. It is soft in comparison to beef fat. The meat of calves has a characteristic odor.

"Monkey" or "bob" veal is a term applied to the carcasses of calves slaughtered during the first three or four weeks of life. It is soft and moist, the muscles are friable and poorly devel-

* In many cases the sum of the constituents does not equal 100, since no account is taken of the carbohydrates. In analyses of meat it is sometimes customary to estimate the protein as the difference between 100 and the sum of the other constituents.

crackling on pressure. The surface of the meat should be just sufficiently moist to be detected, and the longer it is kept the drier it should become. There should be no evidence of any diseased condition, injury, or the presence of parasites.

oped, and the fat is flabby and jelly-like and disagreeable to look upon.

Sheep. Mutton is light red in color and has a characteristic sheepy odor, while the fat is pure white and odorless. In well-fed animals the fat is abundant, especially about the kidneys and

beneath the skin. The meat of the males has at times a very strong so-called buck odor.

Goats. Goats' meat can usually be distinguished from mutton by its characteristic odor and the lack of deposits of fats except around the kidneys and the prominence of the bony processes.

Hogs. The meat of the hog is pale red, some parts being white with usually pure-white fatty tissue, although this varies somewhat with the food and breeding. Upon cooling the meat becomes white. In old hogs the meat is redder and tougher and the subcutaneous accumulation of fat is not so marked. The meat of old boars has an extremely offensive odor, especially noticed during cooking.

Cooking. Meat is not often eaten raw by civilized people. For the most part it is either roasted, broiled, fried, stewed, or boiled. Among the chief objects of cooking are the loosening and softening of the tissues, which facilitate digestion by exposing them more fully to the action of the digestive juices. Another important object is to kill parasites and microorganisms if present, and thus destroy organisms that might otherwise expose the eater to great risks. Minor, but by no means unimportant, objects are the coagulation of the albumen and blood so as to

render the meat more acceptable to the sight, and the development and improvement of the natural flavor, which is often accomplished in part by the addition of condiments.

If meat in cooking is placed in cold water and heated gradually, part of the organic salts, the soluble albumen, and the extractives or flavoring matters will be dissolved out. The broth or soup obtained will be rich, but the meat will be correspondingly tasteless. This tasteless material has been found to be as easily and completely digested as the same weight of ordinary roast. It contains nearly all the protein of the meat, and, if it is properly combined with vegetables, salt, and flavoring materials, makes an agreeable as well as nutritious food. If a piece of

shorter the period of cooking. A very hot fire coagulates the exterior and prevents the drying up of the meat juices. This method would not, however, be applicable to large cuts, because meats are poor conductors of heat, and a large piece of meat exposed to this intense heat would become burned and changed to charcoal on the exterior long before the heat could penetrate to the interior. The broiling of a steak or a chop is done on exactly this principle. An intense heat should be applied to coagulate the albumen thoroughly and stop the pores and thus prevent the escape of the juices.

Experiments on the losses in cooking meat lead to the following deductions: The chief loss in weight during the cooking of meat is due to the driving away of water. When beef is pan broiled there appears to be no great loss of nutritive material; but when it is cooked in water from 3 to 20 per cent of the total solids is found in the broth. Beef which has been used for the preparation of beef tea or broth has lost comparatively little nutritive value, though much of the flavoring material has been removed. The amount of fat found in the broth varies directly with the amount present in the meat—i.e., the fatter the meat the larger the quantity in the broth. The amount of water lost during cooking varies inversely as the fatness of the meat—i.e., the fatter the meat the less the shrinkage in cooking. In cooking in water the loss of constituents is inversely proportional to the size of the piece of meat. In other words, the smaller the piece the greater the percentage of loss. The loss appears to depend upon the length of time of cooking. When meat in pieces weighing from one and one-half to five pounds is cooked in water at 80° to 85° C. (175° to 185° F.) there appears to be little difference in the amount of material found in the broth whether the meat is placed in cold water or in hot water at the start.

Since meat nutrients are principally protein and fat, a considerable amount of carbohydrate foods (bread and other cereals, vegetables, fruits, etc.) are eaten with the meats to form a well-balanced diet. According to the results of a large number of dietary studies, beef and veal together furnished 10.3 per cent of the diet of the average American family, mutton and lamb 1.4 per cent, pork 5.4 per cent, and poultry 1.1 per cent of the total food; beef and veal 24.6, mutton and lamb 3.3, pork 8.8, and poultry 2.6 per cent of the total protein, and 19.5, 3.8, 30, and 1.2 per cent respectively of the total fat.

Export Trade in Meat and Abattoir Products. American export trade in animal products originated in 1876, from which time it was carried on in an ever-increasing scale until only a few years ago the United States furnished one-third the world's supply of meats. Within recent years, however, with the increase in population there has been a large increase in the demand for meat in America; while during the same period the production of cattle for slaughter has markedly decreased. The effect of this condition has been a strong decline in the exports of meat and an increase in the imports. This is particularly true of beef, the imports of which during 1912 were one and one-half times more than the exports. This comes chiefly from Canada, Mexico, and South America. Meats were imported into the United States in but comparatively small quantities prior to October, 1914, when the traffic law, which took effect October 4, admitted

FIG. 8. DRESSED SIDE OF PORK.

meat is plunged into boiling water, the albumen on the entire surface of the meat is quickly coagulated, and the enveloping crust thus formed resists the dissolving action of water and prevents the escape of the juices and flavoring matters. Thus cooked, the meat retains most of its flavoring matters and has the desired meaty taste. The resulting broth is correspondingly poor.

Theoretically, the principal difference between roasting or baking and boiling is the medium in which the meat is cooked. In boiling, the flesh to be cooked is surrounded by boiling water; in roasting, by hot air, although in roasting proper much of the heat comes to the joint as "radiant" heat. In both cases, if properly conducted, the fibres of the meats are cooked in their own juices.

It is interesting and at the same time important to remember that the smaller the cut to be roasted the hotter should be the fire and the

fresh meats, chiefly beef, free of duty, and 197,000,000 pounds were imported between October 4 and June 30, and over 200,000,000 pounds in 1915. The exportation fell very rapidly in the decade 1904-14, especially of fresh and canned beef, but was stimulated by the European War.

(For information regarding the meat-inspection law and its enforcement by the United States Department of Agriculture, see article on PACKING INDUSTRY.)

MEATBIRD. The Canada jay. See JAY.

MEAT EXTRACT. The term meat extract is commonly applied to a large number of preparations of very different character. They may be conveniently divided into three classes: (1) true meat extracts; (2) meat juice obtained by pressure and preserved compounds which contain dried pulverized meat, and similar preparations; and (3) albumose or peptose preparations, commonly called predigested foods. True meat extract made according to Liebig's original directions contains no gelatin, fat, or insoluble albumen; it contains only those ingredients of meat which are soluble in hot water. A standard and commercial extract has been found to consist of 58.5 per cent of organic matter, 21.5 per cent of inorganic matter (salts), and 20 per cent of water. The inorganic matter is rich in phosphates. The organic matter contains a variety of chemically complex substances, including kreatin and kreatinin (qq.v.), xanthine bases, carnine, etc. Such meat extract is valuable as a stimulant, but can by no means serve as a substitute for meat. Its strong meaty taste is deceptive, and the person depending upon it alone for food would certainly die of starvation.

True meat extract is now made on a very large scale, many million acres of land being used as pasturage for the horned cattle required by the industry, and the cattle being of the best English stocks. The steps involved in the process of manufacture are as follows: after the death of the animal the meat is hung up for several hours in cooling halls, then the fat and sinews are removed, and the meat is first chopped and then minced, by machinery, of course. The minced meat is then extracted with pure hot (but not boiling) distilled water in large open pans, the fat gradually rising to the top and being skimmed off. The aqueous extract is next concentrated by evaporation, first in the air, later in vacuum pans, two filtrations being carried out during this stage, and after being further concentrated to a thick sirupy mass, the extract is ready for distribution to the blending factories, to which it is sent in hermetically sealed 100-pound cans.

Broth and beef tea as prepared ordinarily in

the household contain more or less protein, gelatin, and fat, and therefore are foods as well as stimulants. The proportion of water in such compounds is always very large. The preserved meat juice and similar preparations contain more or less protein, and therefore have some value as food. The third class of preparations is comparatively new. The better ones are really what they claim to be—predigested foods. They contain the soluble albumoses (peptoses), etc., which are obtained from meat by artificial digestion.

MEAT FLY. See FLESH FLY.

MEATH, méth. A county of the Province of Leinster, Ireland, bounded on the east by the Irish Sea and the counties of Dublin and Louth, on the north by Monaghan, Louth, and Cavan, on the west by Westmeath and Cavan, and on the south by Dublin, Kildare, and Kings. Area, 906 square miles (Map: Ireland, E 4). The chief river is the Boyne. The soil is a rich, fertile loam, but it is devoted almost entirely to pasture, about 20 per cent being under crops. The staples are potatoes, oats, and turnips. Capital, Trim. Pop., 1901, 67,497; 1911, 65,091.

MEAUX, mô. A town of France, in the Department of Seine-et-Marne, on the right bank of the river Marne, 28 miles east of Paris (Map: France, N., H 4). Opposite is its suburb, Le Marché. It has an episcopal palace, a college, a public library, and a seminary. Bossuet, whose remains lie in the sixteenth-century cathedral of Saint-Stephen, was a bishop here for 23 years. As the centre of the Brie agricultural district it has a brisk trade in cheese, corn, eggs, and poultry; its mills supply Paris with most of its meal and corn. There are manufactures of cotton and other cloths, cheese, sugar, steel, lumber, and machinery. Meaux was the turning point of the German drive on Paris in the early months of the European War which broke out in 1914. The Germans suffered heavy losses and from here began their retreat to the Aisne. See WAR IN EUROPE. Pop. (commune), 1901, 13,690; 1911, 13,600.

MECCA (Ar. *Makkah*, or *Bakkah*, Koran, Sura iii, 90; called also *al Musharrifah*, the Exalted, *Umm al Kura*, mother of cities, and *al Balad al Amin*, the safe place, known to the geographer Ptolemy as *Macoraba*). Capital of the Turkish Province of Hejaz in Arabia, and, through being the birthplace of Mohammed, and containing the Kaaba, the central and most holy city of all Islam (Map: Turkey in Asia, D 7). The two other principal holy cities are Medina and Jerusalem. It is in lat. 21° 28' N. and in long. 40° 15' E., 245 miles south of Medina, and about 65 miles east of Jiddah, its port on the Red Sea, in a narrow, barren valley, surrounded by bare hills from 250 to 800 feet high. The city is about a mile and a half long and from one-third to two-thirds of a mile wide, and is divided into the upper and lower city. An aqueduct built by Zubaidah (810), wife of Harun al Rashid, brings good water from the mountains to the east. By its position Mecca commands the trade routes connecting lower Hejaz with north, south, and central Arabia, and it has at all times been a commercial and religious centre. The streets are somewhat regular, but unpaved; dusty in summer and muddy during the rainy season. The houses are often five stories high. Some of the government buildings, the Hamidiyyah, or

palace of the Governor, the printing office, the chief watch-house, and the three armories, are in the new part of the city (*al Jiyād*) southeast of the *Harām*, or sacred precincts, and this part of the city has a European appearance. The only manufactures of Mecca are rosaries and pottery; some dyeing is also done; the inhabitants make their living chiefly by letting rooms at the time of the pilgrimage (see *HAJJ*) to the pilgrims who come here often to the number of 100,000. The largest number of these pilgrims are Malays and Indians; then come negroes, Persians, Turks, Egyptians, Syrians, Tatars, and Chinese. Ordinarily the city contains about 60,000 inhabitants. The centre of the city is the *Masjid al Harām*, or Sacred Mosque, which lies beneath the level upon which the rest of the city stands and is always liable to inundations from the *Sail*, or mountain torrent. This sacred area is capable of holding 35,000 people; it is surrounded by colonnades, contains the sacred Kaaba, and is the only mosque in the world with seven minarets. (See *KAABA*.) A great number of people are attached to the mosque in some kind of ecclesiastical capacity, as *Khātibs* (preachers), *Kātibs* (scribes), *muf-tis*, judicial assessors, *muezzins*, etc. In addition to this, each section of the Mohammedan world has its representatives in Mecca, who take care of its pilgrims, provide them with lodgings, instruct them in the ceremonies, and the like. By the side of the mosque runs the *Mas'ah*, a street lined by high houses and reaching up to the hills, *Safa* and *Marwah*, through which the pilgrims must run seven times. A telegraph line connects Mecca with Jiddah on the west and with Taif on the east, where the Meccans spend their summer.

The history of Mecca has been an eventful one. Mohammedan legend holds that it was inhabited by Ishmael, whose posterity was supplanted by the *Banu Jurhum* of Yemen, who in their turn were supplanted by the *Khusā'a*, also of Yemen, in the year 210 A.D. About 450 a certain Kusaī of the Koreish family, and an ancestor of Mohammed, seized the Kaaba, and his family is supposed to reign there to-day. Here Mohammed was born (c. 570), and in the same year the city was menaced by the Abyssinians ("Year of the Elephant"). Its patricians opposed the Prophet, but gave in eight years after he had fled to Medina in 630. Though large sums of money were lavished upon it by successive Mohammedan rulers, it was not an easy city to hold. It had its own pretender to the caliphate in Abdallah ben Zobeir, who was besieged in Mecca in 692 by the Caliph al Hajjaj and finally slain. In 930 it was devastated by the Karmathians. But it always had its own rulers or sherifs, descendants of the Prophet through Hasan, son of Ali; and, though they recognized the supremacy of the Fatimides, Mamelukes, and Turkish sultans, they had a large measure of independence. Since Selim I (1517) they have ruled in the name of the Turkish Sultan. In 1803 the Wahhabis took the city, but were driven out by Mehemet Ali in 1813. A change in the dynasty of sherifs occurred in 1827. Since 1840 their prestige has gradually diminished, a *wali* (governor) being sent by the Porte to offset their power. Though all non-Mohammedans are strictly prohibited from visiting the sacred territory, some Europeans have been there (see *HAJJ*, where the literature will also be found). Consult: Christian Snouck-Hur-

gronje, *Mekka* (The Hague, 1888-89, with atlas); Kahn and Sparroy, *With the Pilgrims to Mecca* (New York, 1905); A. J. B. Wavell, *A Modern Pilgrim in Mecca* (London, 1912).

MÉCHAIN, mǎ'shān', PIERRE FRANÇOIS ANDRÉ (1744-1804). A French astronomer, born at Laon. He attracted the attention of Lalande (q.v.), who secured him a place as government hydrographer to survey the French coasts. He still, however, managed to keep up his astronomical studies, and was in 1782 elected to the Academy. In 1791, when the government had decided to use the arc of meridian between Dunkirk and Barcelona as a basis for the new metric system, he was employed to measure that portion which lies between Rodez and Barcelona. On the completion of this work he resumed his observations at Paris, but, an error having been discovered in his measurements, he returned to Spain to correct it and was there stricken with yellow fever. He contributed memoirs on eclipses and the theory of comets to the *Transactions* of the Academy of Sciences and to the *Connaissance du Temps*, of which he was editor from 1784 to 1794.

MECHANICAL ADVANTAGE. See MECHANICAL POWERS.

MECHANICAL ENGINEER. See ENGINEER AND ENGINEERING.

MECHANICAL ENGINEERS, AMERICAN SOCIETY OF. An association of professional mechanical engineers, manufacturers, and professors in technical schools, organized in New York in 1880 to promote the arts and sciences connected with engineering and mechanical construction. The headquarters are in the Engineering Societies Building, 29 West 39th Street, New York, given by Andrew Carnegie to the engineering profession. Two general meetings are held yearly—the annual meeting in New York during the first week in December and the spring meeting in some other city. Local meetings are held during the year in several cities under the direction of local sections, and student branches are established in many of the technical colleges. There are five grades of membership—honorary members, chosen from those of acknowledged professional eminence; members, consisting of engineers or teachers of applied science of 32 years of age or over who have been in active practice of their profession for at least 10 years and in responsible charge of important work for five years; associates, 30 years of age or over, connected with some branch of engineering, science, or arts, and qualified to coöperate with engineers; associate members, consisting of professional engineers not less than 27 years of age who shall have been in active practice for at least six years and in responsible charge of work for at least one year; and juniors, 21 years of age or over, who must have had such engineering experience as to enable them to fill subordinate positions in engineering work, or who have graduated from a technical school of recognized standing. The society publishes a monthly journal of engineering, an annual volume of transactions, and numerous pamphlets and reports on engineering subjects. It coöperates in maintaining the Library of the Engineering Societies in New York, a free reference library, containing over 65,000 volumes of engineering and scientific literature and receiving regularly 800 American and foreign periodicals. The membership of the society is over 6000.

MECHANICAL POWERS — MACHINES. Technically described a machine is a combination of resistant bodies for modifying energy and doing work, the members of which are so arranged that, in operation, the motion of any member involves definite, relative, constrained motion of the others. A brief analysis of this definition will help to make it clear. First, a machine must consist of a combination of bodies; thus, a lever must have its fulcrum, a screw its nut, a wheel and axle its bearings, and so on with other examples; the simplest machine must have at least two members between which relative motion is possible. Second, the members of a machine must be resistant in order to transmit force; they generally are rigid, but not necessarily so, since flexible belts, chains, or springs may be employed to transmit force under the particular action to which they are adapted. Third, a machine is used to modify energy and perform work. This proposition is obvious. The conception of a machine involves the conception of some source of energy and a train of mechanism suitably arranged to receive, modify, and apply the energy derived from this source to the desired end. A machine, then, consists of (1) parts receiving the energy; (2) parts transmitting and modifying the energy; and (3) parts performing the required work. Finally, (4) the relative motions of the members of a machine are constrained or restricted to certain definite, predetermined paths in which they must move, if they move at all, relatively. The first two propositions of the definition are equally true of structures (such as a bridge) as of machines, but the third and fourth are true of machines only and serve to distinguish machines from structures. A structure modifies and transmits force only, and does not permit relative motion of its members; a machine modifies and transmits force and motion, i.e., energy, and permits relative constrained motion of its members.

The distinction between a machine and a mechanism remains to be explained. A mechanism is a combination of resistant bodies for transmitting and modifying motion (not motion and force or energy as in machines) so arranged that, in operation, the motion of any member involves definite, relative, constrained motion of the other members. A mechanism does work incidentally, such as the overcoming of its own frictional resistance; its primary function is to modify and transmit motion; a mechanism or combination of mechanisms which receive energy and transmit and modify it for the performance of useful work constitutes a machine.

Machines are of various degrees of complexity, but the simple parts or elements of which they are composed are reducible to a very few. These elementary machines are called the mechanical powers, and are commonly reckoned as the lever, the inclined plane, the jointed link, or toggle joint, and the hydraulic press. All machines and all locomotor movements of animals resolve themselves into the action of one or a combination of these simple mechanical powers or machine elements. A few observations applicable to all may appropriately be made here. 1. In treating of the theory of the lever and other

mechanical powers the question really examined is, not what power is necessary to move a certain weight, but what power is necessary to balance it. This once done, it is obvious that the least additional force will suffice to begin motion. 2. In pure theoretical mechanics it is assumed that the machines are without weight. A lever, for instance, is supposed to be a mere rigid line; it is also supposed to be *perfectly* rigid, not bending or altering its form under any pressure. The motion of the machine is also supposed to be without friction. In practical mechanics the weight of the machine, the yielding of its parts, and the resistance of friction have to be taken into account. 3. When the effect of a machine is to make a force overcome a resistance greater than itself it is said to give a *mechanical advantage*. A machine, however, never actually increases power—for that would be to create work or energy, a thing as impossible as to create matter. What is gained in one way by a machine is always lost in another. One pound of weight at the long end of a lever will lift 10 pounds at the short end, if the arms are rightly proportioned; but to lift 10 pounds through 1 foot it must descend 10 feet. The two weights, when thus in motion, have equal momenta; the moving mass multiplied into its velocity is equal to the resisting mass multiplied into its velocity. When the lever seems to multiply force it only concentrates or accumulates the exertions of the force. The descending one-pound weight, in the case above supposed, may be conceived as making 10 distinct exertions of its force, each through a space of 1 foot; and all these are concentrated in the raising of the 10-pound weight through 1 foot. The principle thus illustrated in the case of the lever holds good of all the other mechanical powers. 4. The object of a machine is not always to increase force or pressure; it is as often to gain velocity at the expense of force. (See LEVER.) In a factory, e.g., the object of the train of machinery is to distribute the slowly working force of a powerful water wheel or other prime mover among a multitude of terminal parts moving rapidly but having little resistance to overcome. 5. The mechanical advantage of a compound machine is theoretically equal to the product of the separate mechanical advantages of the simple machines composing it; but in applying machines to do work allowance must be made for the inertia of the materials composing them, the flexure of parts subjected to strains, and the friction, which increases rapidly with the complexity of the parts; and these considerations make it desirable that a machine should consist of as few parts as are consistent with the work it has to do. 6. The forces, or “moving powers,” by which machines are driven are the muscular strength of men and animals, wind, water, electrical and magnetic attractions, heat, etc.; and the grand object in the construction of machines is with a given amount of impelling power to get the greatest amount of work of the kind required. (See WORK; FOOT POUND.) This gives rise to a multitude of problems, some more or less general, others relating more especially to particular cases—problems the investigation of which constitutes the science of applied mechanics. One of the questions of most general application is the following: if the resistance to a machine were gradually reduced to zero, its velocity would be constantly accelerated until it attained a maximum, which would be when the

point to which the impelling force is applied was moving at the same rate as the impelling force itself (e.g., the piston rod of a steam engine) would move if unresisted. If, on the other hand, the resistance were increased to a certain point, the machine would come to a stand. Now the problem is to find between these two extremes the rate at which the greatest effect or amount of work is got from the same amount of driving power. The investigation would be out of place here, but for a turbine the greatest effect is produced when the velocity of the point of application is one-half of the maximum velocity above spoken of. The moving force and the resistance should therefore be so adjusted as to produce this velocity. See MECHANICS.

MECHANICAL SENSE IN ANIMALS.

In animals the simplest and most primitive form of sensory response is that to mechanical stimulation. The animal exhibits a negative or avoiding reaction to intense stimulation and a positive or accepting reaction to weaker stimuli. The flatworms, e.g., when prodded by a bristle move away, but when touched by a fine hair turn towards it. Either reaction may take more than one form. The flatworm may avoid the bristle by turning away, by hastening forward, or (in the case of violent prodding) by turning abruptly towards the bristle and beyond it. The positive reaction, when it takes the form of a tendency to remain in contact with a solid body, is frequently spoken of as thigmotaxis. Earthworms show thigmotaxis when they crawl along the corners of a box or passage in which they are placed, and their burrowing instinct undoubtedly involves the same tendency.

In its least complex form the mechanical sense is often inseparable from the chemical sense and the light sense; the reactions to mechanical, chemical, photic, and even acoustic stimuli may be identical. (See CHEMICAL SENSE IN ANIMALS; HEARING IN ANIMALS; TROPISM; VISION IN ANIMALS.) In its higher forms it becomes differentiated into the modalities of cutaneous and kinæsthetic sensibility. See KINÆSTHETIC SENSATIONS IN ANIMALS; TOUCH IN ANIMALS.

MECHANICAL TISSUE. The supporting tissue (stereome) of the plant, including not only the vascular system but also the cortical sclerenchyma and collenchyma. Cortical mechanical tissue is particularly prominent in the hypodermis of stems and leaves.

MECHANICAL UNITS. Various units or standards used in different countries and under different conditions for the expression of mechanical quantities. One system, the C. G. S. system (q.v.), is based upon the centimeter, the gram, and the mean solar second. Another uses the foot, the pound, and the mean solar second. The yard and the pound are legally defined in England as follows: "The straight line or distance between the centres of the transverse lines in the two gold plugs in the bronze bar deposited in the office of the Exchequer [London] shall be the genuine standard yard at 62° F.; the pound is the mass of a certain piece of platinum marked 'P. S. 1844, 1 pound,' and deposited at the office of the Exchequer." Both the standard yard and pound are now preserved at the Standards Office of the Board of Trade, London. In the United States the customary or Anglo-Saxon measures are referred to the Metric Standards, the yard being $\frac{3600}{63360}$ of the standard meter and the pound $\frac{4535924277}{10000000000}$ of the standard kilogram. Still another system is based upon the foot (one-

third of the yard), the mean solar second, and the *weight of one pound at sea level and latitude 45°* as the unit of force. (A unit mass is given an acceleration unity by a unit force; hence, since the unit force gives per second an acceleration 32.172 feet per second to a mass of one pound, it will give an acceleration 1 to 32.172 pounds; therefore, on this system, the unit of mass is 32.172 pounds.)

The relations between these units is as follows:

1 centimeter = 0.3937 inch = 0.01093611 yard.
1 yard = 91.4402 centimeters.
1 gram = 0.00220462 avoirdupois pound = 15.4324 grains.
1 pound = 453.5924 grams.

The units for the various important mechanical quantities are derived from them. These derived units and a few others are given in the following sections:

Velocity.—One centimeter per second; one yard (or foot) per second; one nautical mile (6080 feet) per hour is called a *knot*.

Acceleration.—Unit velocity per second.

Force.—One gram with unit C. G. S. acceleration = *dyne*; one pound with unit (ft.-lb.-sec.) acceleration = *poundal* = 13,825 dynes. Weight of one pound = 444,520 dynes.

Work.—One dyne acting through one centimeter = *erg*; 10⁷ ergs = *joule*. One pound raised one foot = *foot pound* = 1.356 joules. One kilogram raised one meter = *kilogrammeter* = 9.81 joules. (The last two relations are approximate.)

Power.—One joule per second = *watt*; 33,000 foot pounds per minute = *horse power* = 746 watts; force de cheval = 75 kilogrammeters per second = 736 watts.

Pressure.—One dyne per square centimeter = *barie*. One megadyne (10⁶ dynes) per square centimeter = *megabarie*. Weight of one pound per square foot = 47.9 dynes per square centimeter; one poundal per square foot = 14.88 dynes per square centimeter; one centimeter of mercury = 13.5950 × 980.692 dynes per square centimeter = 13,332.5 dynes per square centimeter; hence 75 centimeters of mercury = 1 megabarie (very closely); 76 centimeters of mercury, one atmosphere = 1.0133 megabaries.

MECHANICS (Lat. *mechanica*, from Gk. μηχανικά, *mēchanika*, μηχανική, *mēchanikē*, mechanics, from μηχανή, *mēchanē*, device). The science which is concerned with the motion of matter: the possible kinds of motion, the conditions under which the motion remains unchanged, and those under which it changes. That branch of mechanics which discusses the possible kinds of motion is called *kinematics*, while that which discusses the properties of matter in motion is called *dynamics*. Dynamics is divided also into two parts—*statics* and *kinetics*—the former treating the conditions under which there is no change in the motion, the latter those under which there is change.

HISTORICAL SKETCH

The first mechanical problems solved were those dealing with the simple machines. Archimedes (287–212 B.C.) was acquainted with the law of the lever in its simplest form, and Leonardo da Vinci (1452–1519) stated the law for the most general case, when the forces were in any directions and applied at any points. The principle of the inclined plane was known to Galileo (1564–1642) and to Stevinus (1548–1620). Stevinus was the first to use a line to

describe a force, and to make use of the principle of the composition and resolution of forces; he also discussed the properties of pulleys and combinations of pulleys, using the principle that, if force applied to the cord (a weight) move down a certain distance, a weight fastened to the pulley must move up a distance such that the product of each weight by its distance is the same. This principle is that of virtual velocities, so called, which was applied also by Galileo, Torricelli, Bernoulli, and Lagrange. In his treatment of the inclined plane Galileo made use of the general principle that there is equilibrium in any case when the weight as a whole cannot descend farther; or, as Torricelli expressed it, when the centre of gravity cannot descend.

Galileo was the founder of the science of dynamics. He recognized the fact that, if a piece of matter were in motion and were free from external action, it would continue its motion unaltered. He proved by experiment that all bodies fall with the same acceleration towards the earth, and proposed that the value of a force's action on a body be measured by the acceleration produced. He recognized the independence of different motions in discussing the motion of a projectile. He was acquainted, too, with the general properties of a simple pendulum, especially its property of having a definite period which varied with the length of the string.

Huygens (1629-95) did fully as important work as Galileo and deserves to rank with him. He deduced the formula for centrifugal motion, $a = s^2/r$. He invented a pendulum clock and the escapement for it; he used a pendulum to determine g ; and proposed a seconds pendulum as a standard of length. He solved the problem of deducing the length of a simple pendulum which would vibrate in the same period as a compound one, i.e., he determined the position of the centre of oscillation (q.v.). In this last deduction he made use of the principle that, in whatever manner the particles of a compound pendulum influenced each other, the velocities acquired in the descent of the pendulum are such that by virtue of them their centre of gravity rises just as high as the point from which it fell, whether the pendulum is considered a rigid body or as breaking up into particles each connected with the axis by a cord and thus forming a great number of simple pendulums. If p_1, p_2 , etc., are the weights of the particles, h_1, h_2 , etc., are the distances they have fallen at any instant, and s_1, s_2 , etc., are their speeds at that instant. Huygens's principle leads to the relation $\frac{1}{2}p_1s_1^2 + \frac{1}{2}p_2s_2^2 +$

$$\text{etc.} = (p_1h_1 + p_2h_2 + \text{etc.}) \frac{1}{g} \text{ or}$$

$$\Sigma \frac{1}{2}ps^2 = \frac{1}{g} \Sigma ph.$$

In the case of a rigid body turning around a fixed axis $\Sigma \frac{1}{2}ps^2 = \frac{1}{2}\omega^2 \Sigma pr^2$, where ω is the angular speed and r is the distance of the particle of weight p from the axis. Thus, Huygens was led to the use of Σpr^2 as a measure of the inertia of a rotating body. He did not, however, realize the idea of mass as distinct from weight. The name "moment of inertia" was given Σmr^2 by Euler.

Newton gave the principles of mechanics their final form, and since his day there have been no important additions to them. We owe to Newton (1642-1727) the recognition of other forces than weight, the general idea of force, and in particular the conception of inertia or mass as a

property of matter distinct from its weight, the general statement of the principle of the composition and resolution of forces, and the law of action and reaction being equal but opposite. Newton adopted as the proper measure of a force the acceleration produced in a given portion of matter; or, in other words, the velocity produced in a given time. According to Huygens the measure of the force is the square of the velocity produced in a given distance. Among the philosophers who came after Newton and Huygens there was a school, following Descartes, who measured forces by the change in mv ; another, following Leibnitz, who measured it by the change in mv^2 . Thus, to a certain extent one school succeeded Newton; the other, Huygens. The two were shown by D'Alembert to be identical, although there was a great controversy for many years concerning their relative merits.

KINEMATICS

All possible motions of any geometrical figure may be divided into two classes: *translation* and *rotation*. In the former all lines in the moving figure remain parallel to themselves, i.e., the motions of all the points are identical; in the latter all the points of the figure are describing circles whose centres lie on a straight line called the axis. In the general case the motion of a figure is a combination of translation and rotation.

Translation. In motion of translation it is necessary to consider the motion of one point of the figure only, as that is the same for all the points. If the figure is moved from one position to another, this *displacement* may be represented by a straight line joining the initial and final positions of any one point of the figure. This line indicates by its direction and its length the displacement of the whole figure; it is called a *vector*, and displacement is said to be a *vector quantity* because it requires for its complete understanding a direction and a numerical quantity only, and so can be pictured by a straight line having the proper direction and a length equal to or proportional to the numerical quantity.

If the motion of the figure is uniform—i.e., if it passes over equal distances in equal intervals of time—the rate of motion, or the distance traversed divided by the time taken, is called the *linear speed*. If the motion is not uniform, the linear speed at any instant is the distance which the figure would move in the next second if its motion were to continue for that interval of time at exactly the same rate as it is at that instant: in mathematical symbols, if Δx is the length of the extremely short distance traversed in the extremely short interval of time Δt immediately following the given instant, the

linear speed at that instant is the value of $\frac{\Delta x}{\Delta t}$ in the limit as Δt is taken smaller and smaller. Speed is therefore a number. If the speed in a particular direction is considered—i.e., if a distinction is made between the motions of figures with the same speed but in different directions—the linear speed in a given direction is called the *linear velocity* in that direction. Linear velocity is evidently a vector quantity, the linear speed giving the numerical quantity, i.e., the length of the vector.

If a figure is given simultaneously two displacements, the resulting displacement is evidently found by adding geometrically the two

components. Thus, if AB and BC represent the two component displacements, the actual one will be AC , formed by placing BC so as to continue the motion indicated by AB and completing the triangle. (A man walking across the deck of a moving ship illustrates this composition of displacements.) Similarly, if AB and BC represent

the linear velocities of the two component motions, the actual velocity is represented in direction and speed by AC . In a perfectly similar manner three, four, etc., vector qualities may be added geometrically. Further, conversely, any displacement or velocity may be regarded as made up of two displacements or two velocities, the condition being that the two vectors representing the component quantities should form a broken line joining the ends of the vector representing the actual quantity. This is called "resolution" of displacement or velocity. In resolving vectors it is nearly always best to take the components so that they are at right angles to each other, for then they are independent of each other. Thus, if AB is a displacement—or any vector—its component in the direction AF is the vector AC obtained by dropping a perpendicular from B upon AF . AB is equivalent to AC and CB , but CB has no connection with the direction AF , and AC is then that component of AB which

indicates how much AB is concerned with the direction AF . In mathematical language the component in the direction AF of a vector AB is $AB \cos(CAB)$.

In general the velocity of a moving figure will not be constant, and the rate of change of the linear velocity at any instant—i.e., if Δv is the extremely small change of the velocity in the extremely small interval of time Δt , the limiting value of $\frac{\Delta v}{\Delta t}$ —is called the *linear acceleration* at that instant. It is evident that acceleration, being the change in velocity and therefore the difference between two lines, is itself a vector quantity: it has a numerical value and a definite direction, and, as with displacements and velocities, accelerations can be compounded by geometrical addition or resolved into components. Since linear velocity is characterized by a speed and by a direction, it can change in two independent ways: the speed can change, the direction remaining the same, e.g., a falling body; the direction can change, the speed remaining the same, e.g., a particle moving in a circle at a uniform rate. (In general, both speed and direction change, e.g., a vibrating simple pendulum.) There are therefore two independent

types of linear acceleration. The three most interesting cases of linear acceleration are the following:

1. Motion in a straight line, constant acceleration. If the acceleration is positive, the speed increases; if it is negative, the speed decreases. Let the acceleration be called a , and the speed at any instant s_0 ; then, t seconds later, the speed will be $s = s_0 + at$, and the distance traversed in that time will be $x = s_0 t + \frac{1}{2} at^2$. If t is eliminated from these equations, it is seen that $s^2 - s_0^2 = 2ax$. These formulae apply to a body falling freely towards the earth, in which case $a = 980$; to a body thrown vertically upward, in which case $a = -980$; and to many other illustrations.

2. Uniform motion in a circle. If the circle has a radius r , and if the constant speed is s , the acceleration has for its numerical value $\frac{s^2}{r}$, and its direction at any instant is along the radius towards the centre from the point where at that moment the moving point is. This last fact is evident if the change in the *velocity* is considered. At any position in its path around the circle the moving point has a *velocity* along the tangent to the circle; the following instant that velocity is changed into the next tangent; and to secure this change a small vector perpendicular to the first tangent must be added to the vector representing the first velocity. The proof that the numerical value of the acceleration is $\frac{s^2}{r}$ will be found in all textbooks on mechanics.

If the point makes N complete revolutions per second $s = 2\pi rN$; and the acceleration equals $4\pi^2 rN^2$.

3. Simple harmonic motion of translation. This is a vibratory motion, to and fro along a straight line such that, if distances from its middle point are called x , the acceleration of the moving point when it is at a distance x from the centre has the numerical value $n^2 x$, where n is a constant quantity, and its direction is towards the middle point or centre. (To distances at one side of the centre are given positive values; at the other side, negative.) This motion can be easily shown to be identical with that of the point which is the projection on a diameter of a point moving in a circle with uniform speed. It can be shown further that the *period* of this harmonic motion, i.e., the time required for the point to go from one end of its path to the other and back again, is $2\pi/n$, where $\pi = 3.1416$. Half the length of the path is the *amplitude*, and the position of the vibrating point at any instant gives its *phase*. Thus, there may be two vibrating points which have the same period and the same amplitude, but differ in phase—one point lags apparently behind the other.

A pendulum with a long supporting cord makes harmonic vibrations, if the amplitude is small; so does any point of a violin string, if the string is vibrating in its simplest mode; so does a weight hanging from a rubber band or a spiral spring, if it is set vibrating in a vertical direction.

Rotation. It can be shown by geometry that if a figure of any shape with one point fixed is displaced in any way by any series of rotations, the final position may be reached from the initial one by a single rotation around an axis passing through the fixed point. The simplest

mode of describing such a displacement is to imagine a plane section through the figure perpendicular to this axis, to take in this plane a line *fixed in space* and one *fixed in the figure*, and then to measure the rotation by the change in the angle made with the former line by the latter as the figure turns around the axis. Three things are then necessary for the representation of the angular displacement: (1) the *position* of the axis; (2) its *direction*—a line in one direction will represent rotation in the direction of the hands of a watch, while one in the opposite direction will represent opposite rotation; (3) the *numerical value* of the angle of displacement, measured as just described.

(The numerical value of the angle between two lines is obtained by describing a circle of any radius, R , with the point of intersection of the lines as the centre, measuring the length of the arc, A , intercepted between the two lines, and dividing A by R . See TRIGONOMETRY.)

This angular displacement can be completely pictured by a straight line in the proper direction made to coincide with the axis of rotation and of a length proportional to the angle of rotation. Such a line is called a *rotor*, or a *localized vector*, because it is a vector placed in a definite position.

If a rotation around a fixed axis is considered, the *angular speed* is the rate of change of the angle formed by the line fixed in space and that fixed in the figure, as described above. The *angular velocity* in this case is the angular speed around the given axis in a definite sense of rotation; it is therefore a rotor. If a figure with one point fixed is given simultaneously two angular velocities around two different axes, the resultant angular velocity will be a rotor which is the geometrical sum of the two component rotors. *Angular acceleration* is the rate of change of angular velocity, and there are two independent types: (1) the position of the axis fixed, but the angular speed changing; (2) the angular speed constant, but the position of the axis changing. A door or gate when opening or closing is an illustration of the first type; while a spinning top generally furnishes an illustration of the second, because, when the axis of the top is not vertical, it is moving so as to describe a cone in space. Actually in the case of a spinning top the angular speed is decreasing owing to friction, so it is an illustration of the combination of the two types.

The three most interesting cases of rotation are the following:

1. Position of axis fixed, constant angular acceleration. If the constant acceleration is α , and if at any instant the angular speed is ω_0 , the angular speed t seconds later will be $\omega = \omega_0 + \alpha t$, and the angle rotated through in that interval of time will be $\theta = \omega_0 t + \frac{1}{2} \alpha t^2$. If t is eliminated from these two equations, it is seen that $\omega^2 - \omega_0^2 = 2\alpha\theta$. This motion is illustrated by a flywheel or grindstone coming to rest under a constant friction or being set in motion at a uniform rate.

It is evident from the above definition of the numerical value of an angle that if the *linear* speed and acceleration of any point at a distance R from the axis are s and a , they are connected with the *angular* speed and acceleration of the whole figure by the relations $s = R\omega$, $a = R\alpha$.

2. Angular speed constant, but the position of the axis describing a cone at a uniform rate. This motion is illustrated, as explained above,

by a spinning top. A piece of apparatus which furnishes a more accurate illustration consists essentially of a heavy wheel whose axle is so supported that it can turn freely within a circular ring which is fastened rigidly to a metal rod carrying sliding weights at its further end; this rod is pivoted at its middle point so as to be free to turn in any direction; and the axle of the wheel is set in the same line as this rod. This instrument is called a gyroscopic pendulum.

(For a description of one made out of a bicycle wheel, see *Physical Review*, 1901, vol. x, p. 43.) To produce the desired motion, balance the wheel and its ring by means of the sliding weights until the rod is horizontal, set the wheel in rapid rotation, and disturb the balance slightly by adding a small weight to either portion of the rod. The rod will immediately begin to move around in a horizontal plane; and thus the position of the axis of rotation of the wheel will change, and will describe a plane—the limiting form of a cone. The reason for this change is that there is compounded with the angular velocity of the wheel around its own axis another one due to the disturbed balance of the rod which would of itself make the whole apparatus rotate around a horizontal axis, i.e., turn over as the extra weight pulls its side down. This added angular velocity is about an axis at right angles to that of the wheel, and both lie in a horizontal plane; the two angular velocities will compound therefore to form an angular velocity about an axis in the same horizontal plane, but in a position different from that of the axis of the wheel before it was disturbed. As fast as this axis takes up its new position it is again disturbed; and so the motion is a continuous change of position of the axis of the wheel in a horizontal plane. (This case in rotation corresponds, therefore, perfectly to the one in translation of motion of a point in a circle at a uniform speed.) In the actual use of the gyroscopic pendulum there are other phenomena depending upon the properties of matter in motion; the above description is designed to be a purely kinematic one.

3. Simple harmonic motion of rotation. This motion is illustrated by the to-and-fro rotation of an ordinary clock pendulum or by the vibrations of any body set swinging through small arcs when suspended on a horizontal axis, also by the balance wheel of a watch. Let, as before, two lines be taken in a plane at right angles to the axis, one fixed in the figure, the other in space, but so chosen that they coincide when the vibrating figure is in its central position. Then, if θ is the angular displacement at any instant of the line fixed in the figure from the one fixed in space, the angular acceleration equals $m^2\theta$, where m is a constant quantity, and the direction of the axis of the acceleration is such as always to produce an angular velocity towards the position of equilibrium. The period of a complete vibration may be shown to be $2\pi/m$. The amplitude is the extreme angle turned through by the line fixed in the figure; the phase at any given instant depends upon the position of this line at that instant.

Motion in General. Translation and rotation are particular types of motion, and in general the motion of a figure includes both. It may be proved, however, by geometry that the most general displacement of a figure, produced by any number of motions, may be reduced to a combination of a translation along a certain line

and a rotation around it as an axis; such a combination is called screw motion.

DYNAMICS

Kinematics is a science which is concerned with geometrical ideas alone; it is the application of logical principles to certain definitions and axioms; it is not concerned with any appeal to experience. On the other hand, dynamics is fundamentally a science based on our experience of certain sensations associated with the idea of matter; and the object of the science is to make such an analysis of the facts of observation and experience as will lead to the statement of a few principles from which all observed phenomena may be predicted. It is possible to have a science based entirely on definitions—which are suggested by observations, however—and to show that all observed phenomena can be regarded as consequences of these definitions, if they are identified with actual physical quantities which appeal to our senses. Such a science is called theoretical dynamics. In the following treatment statics is considered as a special case of kinetics.

Translation. The simplest property of matter (q.v.) is illustrated by an experiment due to Galileo. If a ball rolls down an inclined plane and then meets another plane inclined in the opposite direction, the ball will roll up it with a constantly decreasing velocity; the less inclined this second plane is, the less is the rate of change of the velocity of the ball as it rolls up; therefore, if the plane is perfectly horizontal, there is every reason for believing that the cause of the observed decreasing velocity of the ball is friction, and that if there were no friction the velocity of the ball would not change. In other words, it is thought to be a general law of nature that a portion of matter free from all external actions will maintain its state of motion unaltered.

If, however, the motion of one portion of matter is influenced by the presence of another piece of matter, it is observed that the effect is mutual. The simplest case of two bodies influencing each other's motion is illustrated by two billiard balls striking when rolling on a smooth table, i.e., a surface free from friction; by a man standing on a board which rests on smooth ice, and then jumping off; by a bullet fired from a gun; etc. One law applies to all such cases: if m_1 and m_2 are the masses of the two pieces of matter which are supposed to be so small as to be called particles, v_1 and v_2 their linear velocities at any instant, V_1 and V_2 their linear velocities at any later time, then

$$m_1v_1 + m_2v_2 = m_1V_1 + m_2V_2,$$

provided there are no external actions, i.e., provided that the only cause of the change in the linear velocity of one body is connected with the presence of the other. In this equation the sum of m_1v_1 and m_2v_2 and of m_1V_1 and m_2V_2 is a geometrical one, for each of the terms is a vector quantity. Owing to the importance of the product mass $\times$ linear velocity, it has received a name—*linear momentum*. See IMPACT.

This law can be expressed in a different way. If the positions of two particles of matter of masses m_1 and m_2 at any instant are given by coördinates x_1y_1 and x_2y_2 , the coördinates of the centre of inertia (q.v.) are defined to be

$$\bar{x} = \frac{m_1x_1 + m_2x_2}{m_1 + m_2} \quad \text{and} \quad \bar{y} = \frac{m_1y_1 + m_2y_2}{m_1 + m_2}.$$

Consequently as the particles move the centre of inertia changes its position. If u_1 and u_2 are the components along the axis of X of the velocities of the two particles and w_1 and w_2 their components along the axis of Y , the components along the axes of X and Y of the velocity of the centre of inertia are

$$\bar{u} = \frac{m_1u_1 + m_2u_2}{m_1 + m_2} \quad \text{and} \quad \bar{w} = \frac{m_1w_1 + m_2w_2}{m_1 + m_2}.$$

But if v_1 and v_2 are the actual velocities of the two particles, $\bar{v}$ is the geometrical sum of u_1 and w_1 . Consequently, if the actual velocity of the centre of inertia is $\bar{v}$, it is the geometrical sum of $\bar{u}$ and $\bar{w}$; i.e.,

$$\bar{v} = \frac{m_1v_1 + m_2v_2}{m_1 + m_2},$$

or $(m_1 + m_2) \bar{v} = m_1v_1 + m_2v_2 = m_1V_1 + m_2V_2$. Since $m_1 + m_2$ does not change in any physical action, $\bar{v}$ must remain constant in direction and amount, however the velocities of the two particles are altered by their mutual influence.

So far as is known this law of influence of two bodies can be extended to any number of bodies mutually influencing each other; i.e., if any number of particles of matter of masses $m_1, m_2, \dots$ are left alone, free from external actions, their velocities, however changed by mutual reactions, must satisfy the law that the geometrical sum of the linear momenta remains unchanged, $m_1v_1 + m_2v_2 + \dots = \text{constant}$.

Expressed in terms of the properties of the centre of inertia of the system of particles, this law is that the centre of inertia of a system of particles free from external influences moves in a straight line with constant speed. A large solid is of course a special case of a system of particles; and the motion of the centre of inertia of such a body must obey the same laws as does a single particle.

This principle of dynamics is known as the conservation of linear momentum. When this principle is applied to the mutual action of two bodies, it takes the form

$$m_1v_1 + m_2v_2 = \text{constant},$$

where m_1 is the mass of one body and v_1 is the velocity of its centre of inertia, m_2 is the mass of the second body and v_2 the velocity of its centre of inertia, and the summation is a geometrical one. This equation means, then, that if m_1v_1 is changed in any way by v_1 changing either in direction or in speed, m_2v_2 must change at the same time by an amount equal and opposite to that of the change of m_1v_1 . The rates of changes of the two momenta must then be equal and opposite vectors in the same straight line; i.e., $m_1a_1 = -m_2a_2$ if a_1 and a_2 are the linear accelerations of the two centres of inertia. (Illustrations are afforded by a body falling towards the earth, the earth having an acceleration upward; by a piece of iron attracted to a magnet which is suspended free to move; etc.) This may be expressed by saying that under the influence of the second body the first has received an acceleration a_1 . The product m_1a_1 is called the kinetic reaction of the body of mass m_1 against the given influence, which is equal and opposite the kinetic reaction of the second body against the action of the first. The influence of any body on another of mass m is measured, therefore, by the product of m and the acceleration produced, i.e., ma . If there is a system of many bodies, the action on one due to all the others is the sum of its kinetic reactions against

all the actions; i.e., it is the product of the mass of that one into the geometrical sum of the accelerations which each in turn of the others by itself would produce—or the actual acceleration of the one. The product of the mass of any body, therefore, by the linear acceleration of its centre of inertia measures the external influences acting on it. These external influences combine to form what is called the external force. In symbols

$$F = ma,$$

meaning that if a body of mass m is subjected to a given set of external influences its acceleration is given by F/m , or if bodies of different masses are subject to the same force the accelerations produced vary inversely as the masses. A unit force is such an external action as results in an acceleration of 1 when the mass is 1 or an acceleration 2 when the mass is $\frac{1}{2}$, etc. If the C. G. S. system is used, the unit of mass is a gram, and a unit acceleration is a change in one second of the velocity by an amount of one centimeter per second; the unit force on this system is called the dyne. The dyne is so small, being illustrated nearly by the upward force of the hand required to keep a milligram from falling, that a megadyne (or $10^6 \times$ dyne) is used as a practical unit.

There are many kinds of forces (see FORCE)—gravitation, electrical, magnetic, muscular, elastic, etc. It should not be thought that they are *things* that exist; they are simply numerical values of quantities giving the measure of external influences on the motion of a body, e.g., the effect of pulling a string attached to a body, the effect of a magnet on a piece of iron, etc. Forces are vector quantities and may be compounded or resolved into components. The commonest illustrations of a force are given by a body falling freely towards the earth, in which case the acceleration, g , is a constant for all bodies at any one place on the earth's surface (see GRAVITATION), and so the force on a body of mass m is mg , and if a body is suspended and kept from falling there must be an upward force mg due to the suspension; g is nearly 980 centimeters per second per second, or about 32 feet per second per second. This product mg is called the weight of the body.

One of the most important illustrations of force is shown by uniform motion of a particle in a circle, which may be produced by a string whirling the body in a sling, or by making the body roll around inside a horizontal circular hoop on a smooth table. In the former case the string is said to exert a tension on the particle; in the latter, the hoop is said to exert a pressure on it. In both cases the acceleration is s^2/r , where s is the linear speed of the particle and r is the radius of its path and has the direction from the moving particle towards the centre of the circle; consequently the force is ms^2/r in this direction. In other words, to make a particle of mass m move at a uniform speed s in a circle of radius r requires a force acting on it directed towards the centre and with a numerical value ms^2/r , or, if ω is the angular speed of the particle, $m\omega^2 r$. If this force is decreased, the particle will cease to move in a circle and will move farther away from the centre; if the force is removed at any instant—by cutting the string—the particle will continue to move with the same velocity that it has at that instant, i.e., along the tangent to the circle with a constant speed. This fact that, unless the force is

sufficiently great, the particles of a rotating body will move farther away from the axis of rotation is illustrated in many ways. The body is said to move under the action of a centrifugal force.

A simple pendulum is defined to be a particle of matter suspended by a long massless string. If it swings through small angles in a vertical plane, the motion of the particle, or bob, is practically in a straight line, and is simple harmonic. Let O be the point of suspension of the pendulum, let OQ be its position when hanging at rest, and OP its position at any instant while it vibrates; call the angle QOP , θ . There are two forces acting on the particle of mass m placed at P : one is the tension of the string along the string towards O , the other is its weight mg , vertically down. The actual motion at this instant is tangent to the circle whose radius is OP , i.e., it is in the direction PR , either up or down. The force T has no component in this direction, being perpendicular to it; and that of the force mg is $mg \sin \theta$ (using the general formula for resolving a vector). Therefore the acceleration of the vibrating particle, in the direction PR , the force divided by the mass, is

$$\frac{mg \sin \theta}{m} \text{ or } g \sin \theta.$$

This acceleration may be written

$$g \frac{PQ}{OP}; \text{ or calling } PQ, x, \text{ and } OP, l, g \frac{x}{l}.$$

If the amplitude is very small, PQ is practically the path of the moving particle; and thus the motion is harmonic, in accordance with the definition of such motion; and its period, therefore, is

$$2\pi \sqrt{\frac{l}{g}}.$$

For other illustrations of forces, see ELECTRICITY; MAGNETISM; ELASTICITY; GRAVITATION; CENTRAL FORCES.

It has been shown that, if there are no external influences, the centre of inertia of a system of particles or of a large body continues, if in motion, to move in a straight line with a constant speed. This is owing to the fact that the action and reaction of each pair of particles are equal and opposite. If, however, there are external forces, the acceleration of the centre of inertia in any direction is the sum of the components of these forces in this direction divided by the mass of the whole system. This is equivalent to saying that the motion of the centre of inertia of a system of particles is exactly as if a single particle of the mass of the system were under the influence of the given forces. Thus, if an iron beam falls from a building (without touching anything as it falls), the motion of its centre of inertia is like that of a falling particle—vertical—however the beam revolves. If a hammer is thrown at random into the air, its centre of inertia will describe a parabola, because that is the path of a projected particle. See PROJECTILE.

Many forces are not constant and some are abrupt, like the blow of a hammer; and in these cases it is impossible to measure them. Their effect is evidently to produce a sudden change in velocity; and it is measured by the total change in the linear momentum. Force itself is the rate of change of linear momentum; so if a force F acting on a particle produces a change of momentum from mv_0 to mv in an interval of time t ,

$$F = \frac{mv - mv_0}{t},$$

and thus the total change of momentum equals the product of the force and the interval of time. This product Ft is called the impulse of the force, and may be measured even if both F and t are unknown. Similarly, if an impulsive force acts on a large body, the velocity of its centre of inertia will be changed from v_0 to v in the direction of the force. In other words, the change of velocity of the centre of inertia, $v - v_0$, equals the amount of the impulse divided by the mass of the body, entirely regardless of the point of application of the force. The time required for a force F to change the velocity from v_0 to v is

$$\frac{mv - mv_0}{F}.$$

The distance required for this same force F to produce this change in velocity from v_0 to v in its direction is found by the formulæ of kinematics, which show that under a constant acceleration a the distance traversed while the speed changes from s_0 to s is such that $2ax = s^2 - s_0^2$. Therefore, in this case, since $a = F/m$,

$$x = \frac{\frac{1}{2}ms^2 - \frac{1}{2}ms_0^2}{F}.$$

The product Fx , i.e., the force multiplied by a distance in its line of action, is called the work; the quantity $\frac{1}{2}ms^2$ is called the kinetic energy of translation of the body whose mass is m when it has the speed s . This formula is expressed in words by saying that the work done by the force on the body equals the increase in its kinetic energy of translation, provided the speed is increasing, e.g., a train being set in motion. If the speed is decreasing, e.g., a train slowing up by virtue of its brakes and the resulting friction, it is said that the body loses an amount of kinetic energy of translation equal to the work it does in overcoming friction or against the force F .

Rotation. A rigid body is defined as one which is not deformed in any way under the forces acting on it. If such a body is pivoted on an axis whose position is fixed, e.g., a door, a grindstone, etc., it is self-evident that the angular motion produced in it by a force such as a push or pull depends not alone on the amount of the force and its direction but also on its point of application. Thus, if the force is at right angles to the door and near the hinges, there is only a slight effect; if it is applied near the edge of the door, it is much greater; and if the line of action of the force passes through the axis of rotation, there is no effect so far as rotation is concerned. If a plane section be imagined in the body, at right angles to the axis, it is evident that a force perpendicular to this plane, i.e., parallel to the axis, has no effect on the angular motion; while a force lying in this plane has an effect which depends upon both the

force and the perpendicular distance from the point where the axis cuts the plane to the line of action of the force. This perpendicular distance is called the lever arm of the force with reference to the axis; and the product of the numerical value of the force and its lever arm is called the moment of the force around the axis. A moment such that the resulting effect of the force is to produce rotation in one direction is called positive; while if its effect is to produce the opposite rotation it is called negative. A moment is, then, a rotor. It can be shown that the moment of a force about an axis is the proper numerical value to give the rotational effect of the force; for, if a body pivoted on an axis is kept from turning under the opposing actions of two forces differently placed, it is found that the moments of the two forces about the axis are equal and opposite.

If a moment is acting on a pivoted body such as a door, its immediate effect is to produce angular acceleration; just as the effect of a force in translation is to produce linear acceleration. It is important to determine the connection between the moment of the force and the resulting angular acceleration. The simplest case is that of a particle of matter joined to an axis by a massless rigid rod, and a force acting on the particle at right angles to the rod. If the rod has a length r and the particle has a mass m , the moment of the force F around the axis is Fr , and the linear acceleration of the particle in the

direction of the force is $\frac{F}{m}$. Therefore the angular acceleration (α) is $\frac{F}{mr}$; and if the moment of the force is called L ,

$$L = Fr = mr^2\alpha.$$

The coefficient of α , mr^2 , is called the moment of inertia of the particle around the axis. If, now, the rotating body is of any shape or size, it may be shown that the angular acceleration (α) resulting from a moment (L) is given by the formula $\alpha = \frac{L}{\Sigma mr^2}$, where Σmr^2 is the sum

of the products of the mass of each particle of the body by the square of its distance from the axis. Σmr^2 is called the moment of inertia of the whole body around the axis and is commonly written I . Hence

$$L = Ia,$$

a formula for rotation of a rigid body around an axis whose position is fixed, which corresponds perfectly with the formula $F = ma$ for translation. In the same way, therefore, that m measures the inertia of a body so far as translation is concerned, I measures its inertia for rotation.

A simple illustration is that of a body pivoted about a horizontal axis so that it can make oscillations under the action of gravity, like a common clock's pendulum. Take a plane section of the body at right angles to the axis of rotation (at O) and passing through the centre of inertia (C), to describe the rotation choose the line fixed in the body as the one joining the centre of inertia of the body and the point where the axis meets the plane (OC), and as the line fixed in space the one where OC comes when the body is hanging at rest (OA). As the body vibrates, it will occupy in turn different positions which are completely described by the angle

plained later. Calling the length of the line OC , l , the moment of the force mg about the axis through O is $mg l \sin \theta$; therefore the angular acceleration is $\frac{mg l \sin \theta}{I}$, and it is in such a

direction around the axis as to produce angular motion tending to bring OC to coincide with OA . If the amplitude of the vibration is small the $\sin \theta$ may be replaced by θ ; and the angular acceleration is $\frac{mg l \theta}{I}$. Consequently the motion

is simple harmonic, and the period of one complete vibration is $2\pi \sqrt{\frac{I}{mg l}}$. Such an oscillating

body is called a compound pendulum, and it has many interesting properties. (See CENTRE OF GYRATION; CENTRE OF OSCILLATION.) A simple pendulum is a special case of a compound one; in it $I = ml^2$ and so the period becomes, as

before, $2\pi \sqrt{\frac{l}{g}}$.

Since $L = I\alpha$, if the angular velocity around the axis is called ω , this equation may be written

$$L = \frac{I\omega - I\omega_0}{t},$$

where $\omega - \omega_0$ is the change in the angular velocity in t seconds. The product Lt is called the impulse of the moment of the force, or the moment of the impulse of the force. As a result of an impulsive moment, the product $L\omega$ —called the angular momentum—is changed.

The time taken for a moment L to change the angular velocity from ω_0 to ω is evidently

$$t = \frac{I\omega - I\omega_0}{L}.$$

The angle through which the body turns while this change is going on is given by the formula of kinematics $2a\theta = \omega^2 - \omega_0^2$; and as $a = L/I$, the angle

$$\theta = \frac{\frac{1}{2}I\omega^2 - \frac{1}{2}I\omega_0^2}{L}$$

or

$$L\theta = \frac{1}{2}I\omega^2 - \frac{1}{2}I\omega_0^2.$$

The product $L\theta$ is called work; and the work is said to be *done by* the moment if ω is increasing, and *against* the moment if ω is decreasing. $\frac{1}{2}I\omega^2$ is called the kinetic energy of rotation of the body whose moment of inertia about a given axis is I and whose angular speed is ω . (One should note that these values of work and kinetic energy can be derived from the corresponding values for translation if the rotating body is considered made up of particles each of which therefore has motion of translation.)

Motion in General. If the rigid body is not pivoted around a fixed axis but is free to

move in any direction or manner, it will receive, in general, both linear and angular acceleration under the influence of a force, e.g., if a body is thrown in the air. (Under the action of gravity alone there is, however, only linear acceleration, for reasons to be given immediately.) It has been shown that the linear acceleration of the centre of inertia of a body acted on by any forces is the same as that which a particle having a mass equal to that of the body would have under the action of the same forces. A force in general does not have a line of action passing through the centre of inertia; imagine a plane section of the body through the line of action and the centre of inertia; the force will then in general have a moment about an axis through the centre of inertia perpendicular to this plane. Since the translation of the centre of inertia of the body under the action of the force is quite independent of the rotation, the rotation will be exactly as if the above axis is fixed; i.e., if m is the total mass of the body, I its moment of inertia about this particular axis, F the force, and L its moment about the axis, the linear acceleration of the centre of inertia will be $\frac{F}{m}$ and the

angular acceleration $\frac{L}{I}$. So, if the force has its line of action through the centre of inertia, there will be no angular acceleration, e.g., the action of gravity upon a falling body.

If an impulsive force, whose impulse is K and whose lever arm with reference to an axis through the centre of inertia is k , acts upon the body, the velocity of the centre of inertia in the direction of the force will change according to the formula $v - v_0 = K/m$, and the angular velocity about the axis through the centre of inertia will be given by the formula $\omega - \omega_0 = \frac{Kk}{I}$.

If the body is originally at rest, its centre of inertia will move in the direction of the force with a velocity K/m , and it will rotate with an angular velocity $\frac{Kk}{I}$. If the line of the force is

through the centre of inertia, $k = 0$ and there is no angular motion. This fact furnishes an experimental method for the determination of the centre of inertia (q.v.).

If the linear velocity of the centre of inertia at any instant is v , and if the angular velocity is ω , the entire kinetic energy is $\frac{1}{2}mv^2 + \frac{1}{2}I\omega^2$, where m is the total mass and I is the moment of inertia of the body about the axis of rotation through the centre of inertia.

All applications of mechanics to astronomy, etc., are based upon this fundamental equation of Newton, force = mass $\times$ acceleration. If in the future it is proved that matter owes its distinctive properties to its contained electric charges, it will be possible to deduce the laws for mechanics from the laws for electricity; but these laws must certainly agree, within the limits of experimental accuracy, with the Laws of Newton.

Composition of Forces—Statics. If several forces are acting on a rigid body there will be produced as a rule both linear and angular accelerations; it is a problem then to determine what single force, if any, can produce the same result. If such can be found, it is called the resultant. Since, as stated in kinematics, the most general motion is a screw motion, it is impossible in general to have a resultant. If,

however, the forces all have their lines of action in one plane, they have a resultant except in one case to be noted hereafter. Such forces are called coplanar. It is simplest to distinguish between two groups of pairs of forces, parallel and nonparallel.

Two Nonparallel Coplanar Forces. The lines of action of two such forces meet in a point in their plane. Consider a case in which this point is in the rigid body on which the two forces are acting. The effect of a force upon a rigid body is evidently the same wherever its point of application is, provided it is in the line of action of the force. Therefore the action of the two forces in this case is as if they were both applied at that point of the rigid body where their lines of action cross. Their resultant is then found by constructing their geometrical sum at this point; for such a force has obviously a translational effect equivalent to the sum of the effects of the two forces, and it may be shown by simple geometry that its moment around any axis is equal

to the sum of the moments of the two forces around that axis, and so its rotational effect is the same as the combined effects of the two forces. The line of action of the resultant passes through the point of intersection of the two forces, but its point of application can be anywhere in this line; consequently it is entirely immaterial whether the point of intersection itself is a point of the body or not.

Since the process of determining the geometrical sum of two forces consists in forming the parallelogram with these forces as adjacent sides and drawing the diagonal, this principle of the composition of two nonparallel coplanar forces is sometimes called the parallelogram of forces.

It is evident that if the body is under the action of three forces, one of which is equal and opposite to the resultant of the other two, there is no resulting force or moment; i.e., there is neither linear nor angular acceleration. Such a condition is called equilibrium (q.v.). The stability, instability, etc., of equilibrium are discussed in the article on EQUILIBRIUM.

Conversely, if a rigid body is in equilibrium under the action of three nonparallel forces, their lines of action must meet in a point, they must lie in one plane, and one must be equal and opposite to the geometrical sum of the other two. It is obvious that, if these conditions are satisfied, the three forces will, when drawn as lines, form a closed triangle. For this reason this principle is sometimes referred to as the triangle of forces.

Two Parallel Forces. Two parallel forces form a limiting case of two nonparallel coplanar forces whose point of intersection recedes to an infinite distance. Their geometrical sum then becomes their algebraic sum; if the two forces are in the same direction, their resultant is a force parallel to them, in the same plane, and numerically equal to the sum of their numerical values; if they are in opposite directions, their resultant is a force parallel to them, in the same plane, and numerically equal to the difference of

their numerical values. (For the time being the case is excluded in which the two parallel forces are equal and opposite; such a combination is called a couple, q.v.) This resultant must have such a position relative to the two forces that its moment about any axis equals the sum of their moments about the same axis. If the forces are as shown in the figure, F_1 and F_2 being at a known distance $\overline{AC}$ apart and O being the intersection of any axis perpendicular to their plane with the plane, $OCBA$ being a line perpendicular to the forces, the resultant R must have such a position that

$$RBO = F_1AO + F_2CO.$$

Substituting for R its value $F_1 + F_2$, this becomes

$$(F_1 + F_2) \overline{BO} = F_1 \overline{AO} + F_2 \overline{CO},$$

$$\text{or, } F_1 \overline{AC} = (F_1 + F_2) \overline{BC};$$

$$\text{hence } \overline{BC} = \frac{F_1}{F_1 + F_2} \overline{AC},$$

and therefore the position of the resultant is given in terms of known quantities. (This expresses the obvious fact that the moment of the resultant around an axis through C equals the

moment of F_1 around the same axis; for the moment of F_2 around this axis is zero.) In a perfectly similar manner the resultant of two parallel forces in opposite directions may be found.

One of the most important illustrations of parallel forces is given by the gravitational action of the earth on a body. Experiments show that the accelerations of all bodies—all materials and all quantities—when falling freely towards the earth at any point on its surface are the same, g . Therefore each particle of matter of mass m near the surface of the earth is being acted upon by a force mg , whose direction is towards the centre of the earth. Any large rigid body is, then, under the action of a great number of parallel forces. Their resultant is a vertical force Mg , if M is the total mass of the body. Its centre, i.e., the point through which its line of action always passes, however the body is turned, is called its centre of gravity (q.v.). It may be shown analytically and by experiment that this point coincides with the centre of inertia of the body. This is further evident from the fact that, if a body falls, however it revolves in so doing, its centre of gravity must have the acceleration g ; and this property has been shown to be peculiar to the centre of inertia.

It is evident that if a rigid body is under the action of three coplanar parallel forces, one of which is equal and opposite to the resultant of the other two, the body is in equilibrium. The conditions then are (1) that the algebraic sum of the three forces equals zero; (2) that the algebraic sum of the moments of the three forces around any axis equals zero. If any number of coplanar forces, parallel or nonparallel, act on a rigid body, their resultant may be found by compounding them in pairs, as described. If, however, the final pair of forces is a couple, i.e., consists of two equal and opposite forces, there is no resultant. The moment of a couple around any axis perpendicular to their plane is the product of either of the forces by their distance apart; this product is called the strength of the couple. The action of a couple is to make a body rotate about an axis perpendicular to its plane and passing through the centre of inertia of the body; and this can be balanced, not by a single force, but by another couple of equal strength and opposite in direction. A couple is, then, a rotor.

The action on a rigid body of any number of forces in all directions can be reduced in the end to a single force through the centre of inertia and a couple; for each force can be replaced by a parallel force through the centre of inertia and a couple lying in its plane, and so all the forces reduce to the sum of a number of forces all passing through the centre of inertia and to the sum of an equal number of couples each tending to produce rotation around its own axis passing through the centre of inertia.

The dynamics of fluid bodies are considered in HYDRODYNAMICS and PNEUMATICS.

Work and Energy. Two general formulæ were developed in the discussion of translation and rotation,

$$Fx = \frac{1}{2}ms^2 - \frac{1}{2}ms_0^2, \\ L\theta = \frac{1}{2}I\omega^2 - \frac{1}{2}I\omega_0^2.$$

The first formula may be expressed in words as follows: if a particle whose mass is m is moving with a speed s_0 in any direction, this will be changed to s in that same direction under the action of a constant force F in that direction, provided the distance traversed in that time is x as given by the relation $Fx = \frac{1}{2}ms^2 - \frac{1}{2}ms_0^2$. An illustration is afforded by an arrow shot from a bow: $s_0 = 0$, then $Fx = \frac{1}{2}ms^2$. Fx is called the work done by the bow, and the quantity $\frac{1}{2}ms^2$ is called the *kinetic energy of translation*. Any body, not itself in motion, which has the power of producing kinetic energy in another body is said to have *potential energy*. Thus, a bent bow, a compressed spring, a stretched elastic cord, etc., have potential energy. To bend the bow, compress the spring, stretch the cord, etc., a force must be overcome; i.e., motion is produced in a direction contrary to the elastic force of the body. The numerical value of the potential energy is defined as equal to the product of the force overcome and the distance through which this has been done, i.e., to the work done on the bow, spring, or string. If the spring is compressed by a body falling upon it, the spring gains potential energy, since work is done on it and the body loses kinetic energy. (The spring and body together would naturally continue to vibrate up and down, but it may be supposed here that the spring is caught and held when it is compressed to its greatest extent.) If F is the force of opposition due to the spring and x

the distance required to change the speed of the body of mass m from s to s_0 , the gain of potential energy of the spring in that distance is Fx and the loss of kinetic energy is $\frac{1}{2}ms^2 - \frac{1}{2}ms_0^2$, where $Fx = \frac{1}{2}ms^2 - \frac{1}{2}ms_0^2$. Similarly, if the spring expels the body, the spring does work on the body and loses potential energy and the body gains kinetic energy, the loss in potential energy being Fx and the gain in kinetic energy being $\frac{1}{2}ms^2 - \frac{1}{2}ms_0^2$ if in the distance x the speed is increased from s_0 to s ; and as before, $Fx = \frac{1}{2}ms^2 - \frac{1}{2}ms_0^2$. The kinetic energy of the spring itself is neglected.

In words, this formula means that the loss of potential energy of the system producing the acceleration equals the gain of kinetic energy of the particle accelerated; or, the gain of potential energy of a system producing retardation equals the loss of kinetic energy of the retarded particle. Kinetic energy may also be produced by the impact of another body; and all experiments are in accord with the idea that the kinetic energy gained by a body in this case equals that lost by the impinging particle *provided no other effects are produced*. This is illustrated by the impact of perfectly elastic bodies. (In general, when there is impact, heat effects, such as rise of temperature, are produced, in which case the kinetic energy gained by the particle does not equal that lost.) In general, then, in mechanics, whenever one body loses energy another body gains an equal amount, work being simply the transfer of the energy. Work is done in two ways—producing a change in speed and overcoming some opposing elastic force. Unless there is *motion* in the direction of the force no work is done.

It is evident that the kinetic energy of a moving body involves the idea of *speed*, not *velocity*, because the amount of work it can do is independent of the *direction* of the motion. (Also, if there is no change in the speed of a body, the force is at right angles to the motion, and so no work is done, whatever the change in direction may be.) Illustrations of the second formula, $L\theta = \frac{1}{2}I\omega^2 - \frac{1}{2}I\omega_0^2$, are given by the turning of a grindstone and by a flywheel being set in motion or stopped.

There are other ways of doing work than in overcoming elastic forces and producing speed, e.g., raising a body up from the earth, separating a piece of iron from a magnet, separating two bodies electrified oppositely, overcoming the force of friction, etc. In all these cases the body doing the work loses energy and the system on which work is done gains energy. The principle of the conservation of energy is that in every case the energy lost by the former equals that gained by the latter; so that on the whole there is no change. Every phenomenon in nature is in accord with this principle so far as is known.

When a body is raised from the earth work is done equal to the product of the weight of the body and the *vertical* height it is raised, mgh . This amount of energy is gained by the system consisting of the earth and the body whose mass is m ; but until gravitation is understood it will be impossible to locate the energy in any definite place or places. If a body falls through a height h , it and the earth lose potential energy, mgh , which is gained in the form of kinetic energy by the falling body and the earth, principally by the former, since the change in the speed of the earth occasioned by the body as it falls towards

it is so infinitesimal. If, after the body falls a distance h , its speed is s , its kinetic energy is $\frac{1}{2}ms^2$, and therefore $mgh = \frac{1}{2}ms^2$, or $s^2 = 2gh$. This formula shows that the speed of a falling body depends upon the vertical height traversed, not on the slope or length of the path itself; it may fall vertically, or down an inclined plane, or down a spiral, etc.

The cases of work being done against electrical and magnetic forces are discussed under ELECTRICITY and MAGNETISM. Whenever work is done in overcoming friction it is observed that heat effects are produced, which can be traced to the fact that the minute portions of the body on which the work is done gain energy. This question is fully discussed under HEAT. Since, when any inelastic body is deformed in any way, there is internal friction, part of the energy gained by such a body when it strikes another body goes into producing heat effects.

It is a general property of motion, which follows at once from the definition of potential energy, that all motions take place of themselves in such a manner as to make the potential energy of the system decrease, and that equilibrium is not reached until the potential energy has reached a value such that it is a minimum—i.e., is as small as is possible under existing conditions.

The unit of work or energy is that corresponding to a unit force acting through a distance of a unit length. On the C. G. S. system this unit is, then, that corresponding to a force of one dyne acting through one centimeter; it is called an erg. An erg is, however, such a small unit that 10^7 ergs—a joule, as it is called—is ordinarily used as the practical unit. The amount of work done in a unit interval of time by any agency is called its activity or power (q.v.). On the C. G. S. system the unit is, then, one erg per second. The practical unit is, however, one joule per second; this is called a watt.

Machines are mechanical appliances by means of which a force applied at one point and in a definite direction is made to produce a different force at another point and generally in a different direction; the work done by means of the latter force can never be greater than that done by the former—it is in practice always less, owing to friction and other causes. The mechanical advantage of the machine is the ratio of the two forces described above. There are many forms of machines—levers, pulleys, inclined plane, wedge, screw, windlass, etc. (See the separate articles.) The problem in any one case is to determine the theoretical mechanical advantage of a machine; i.e., on the assumption that there is no friction when the forces are working. There are two general methods of solving this: one is to imagine a certain force acting on the machine and to determine by the ordinary principles of equilibrium what second force will just balance the action of the first; the second is to consider the machine in equilibrium under the action of these two forces, then to imagine a small displacement, and to express the fact that the work done by one force equals that done against the other. For the application of these principles to the various machines reference should be made to the separate articles in which they are described.

Bibliography. A brief useful treatise for the general reader, which gives a clear conception of the elementary principles of mechanics, is J. C. Maxwell, *Matter and Motion* (New York, 1892).

The following works, all of which are standard, can be recommended to the student of mechanics: Routh, *Elementary Rigid Dynamics* (London, 1891); id., *Advanced Rigid Dynamics* (ib., 1892); id., *Statics* (2 vols., Cambridge, 1892); E. Mach, *Science of Mechanics* (Eng. trans., Chicago, 1893); Love, *Theoretical Mechanics* (Cambridge, 1897); Routh, *Dynamics of a Particle* (ib., 1898); Ziwet, *Theoretical Mechanics* (New York, 1904); John Cox, *Mechanics* (ib., 1904); Goodman, *Mechanics Applied to Engineering* (London, 1904); Barton, *Mechanical Processes* (Annapolis, 1906); W. B. Anderson, *Physics for Technical Students: Mechanics and Heat* (New York, 1914); E. R. Maurer, *Technical Mechanics* (3d ed., ib., 1914); also the invaluable *International Catalogue of Scientific Literature: Mechanics* (London, 1902 and annually).

MECHANICSBURG, mē-kān'iks-bûrg. A borough in Cumberland Co., Pa., 8 miles west of Harrisburg, on the Cumberland Valley Railroad (Map: Pennsylvania, H 7). It is the seat of Irving Female College (Lutheran) and has a public library. The city is surrounded by a rich agricultural country and has extensive drop-forging works, knitting mills, wheel works, foundry and machine shops, and a spoke factory. The government is vested in a burgess and a council. Mechanicsburg was settled in 1806 and was incorporated as a borough in 1828. It was the most northern point at which the Confederates established headquarters during the Civil War. Colonel Jenkins was in command of a regiment of cavalry quartered here June 28–30, 1863. Pop., 1900, 3841; 1910, 4469.

MECHANICS INSTITUTE. An institution founded in 1891 by a consolidation of the Rochester (N. Y.) Athenæum, incorporated in 1830, and the Mechanics Institute of Rochester, founded in 1885. The institute aims to furnish thorough and efficient training to those who may be engaged in industrial or domestic pursuits which will fit them for positions of trust or as instructors in the same lines of work. It is a technical school and, while it confers no degrees, it grants diplomas and certificates for the satisfactory completion of the various courses of instruction. There are four departments—industrial arts, household arts, applied and fine arts, and academic. The institute occupies a block within two squares of the centre of the city of Rochester. The most important buildings are the Eastman Building, containing laboratories; the Bevier Memorial Building, containing classrooms and an exhibition room; mechanical shops; and a power plant. The regular courses are for nine months. The coöperative industrial and coöperative engineering departments have a twelvemonth's session. There are also evening sessions in practically all departments of instruction and a summer-school session. The total attendance in all departments of the institute in 1913–14 was 522, and the faculty numbered 94. There is an endowment fund of about \$112,000 and an annual current expense fund of about \$120,000, as well as scholarship and students' loan funds. There is a technical reference library of 3500 volumes, and the institute is within two blocks of the Reynolds Library, containing 72,000 volumes. The president in 1915 was Carleton B. Gibson, A.M., LL.D.

MECHANIC'S LIEN. A statutory lien or charge upon real estate to secure payment for work and labor performed on, or materials fur-

nished for, buildings or other improvements thereon at the request or with the consent, express or implied, of the owner. Under the early English law no liens on real estate were recognized, as it was against the policy of the feudal system to permit a tenant thus to charge land which he held of his feudal lord, who in turn held of the King. After the feudal system was abolished lands might be charged with liens by express agreement of the owner, and this became common in the form of mortgages. Courts of equity also recognized certain agreements and transactions as having the force of mortgage liens. Strictly speaking, therefore, there are no common-law liens on real estate. By statute, however, several such liens were created, such as judgment liens and liens for taxes and assessments.

With the development of business customs much work which was formerly done by persons acting as servants for a master came to be performed by independent contractors. For the protection of such contractors and of materialmen whose wares are used in buildings and other improvements on real estate, the statutes known as mechanic's lien laws have been enacted in all the United States and in Canada, but not in England. There was a precedent by analogy for such laws in the common-law liens of artisans on personal property for labor bestowed on it, such as the repair of a wagon or a pair of shoes. Somewhat similar liens on real estate were also recognized and protected by the civil law. The theory on which mechanics' liens are given by statute is that the value of the real estate has been increased by the addition of the improvements on which the work was performed or materials furnished, and that the property so improved may fairly be subjected to such claims. This creates a preference of these claims over those of unsecured creditors of the owner, but a mechanic's lien is subject to valid prior liens on the real estate, such as mortgages, judgments, taxes, etc.

The term "mechanic's lien" is used in a general sense to cover all liens for labor, whether skilled or unskilled, as well as for materials furnished in the construction or repair of buildings. These liens give a right to look to the property for compensation, but, unless the work was directly ordered by him, do not create a personal claim against the owner. As a general rule, the lien attaches both to the building or improvement and to the land on which it is erected; but if the improvement is placed on the land without the owner's consent the lien will not extend to the land, but may nevertheless cover the improvement to the extent of the interest of the person, as the tenant or contractor, who ordered the work and materials. The lien attaches only to the very property on which the work was done, and will not affect the other real estate of the owner. A mechanic's lien may be filed against any title or interest in real estate, even though it is quite limited, as a lease for a year, provided it is such an interest as may be sold on execution.

The statutes in the different States vary in their provisions as to the character of the improvements which will serve to raise a lien. In general, however, such liens will attach to the real estate where any structure in the nature of a building is constructed, altered, or repaired. In some States the right is extended to cover the erection of fences, laying pipes, building sewers,

grading, terracing, or sodding the land, and all other improvements which may be said to benefit the land. The idea of benefit is usually consistently followed, in that the lien does not attach where buildings are torn down or moved from the land. In most States only a person who does work or furnishes materials at the request of the owner or his authorized agent, as a general contractor, is entitled to protect himself by a mechanic's lien. However, in a number of States, subcontractors, i.e., those who work or furnish materials for the one who contracts directly with the owner, are allowed to file direct or subordinate liens against the property.

As a general rule the work to which the owner is entitled under a contract must be entirely performed before the contractor can file a lien, but where an owner defaults in his payments or otherwise breaks his part of the contract, the right to file a lien usually attaches at once. In order to perfect a mechanic's lien the statutes of most jurisdictions provide that a notice setting forth the names of the owner and the party claiming the lien, the character of the work done, a description of the premises, the total contract price, the amount paid thereon, the amount still due, and the date when the last item of work was performed, shall be filed in the county clerk's office and a copy thereof served on the owner of the property affected. In a number of the States this lien attaches and relates back to the time of the commencement of the work upon its being filed, and is prior to all liens for work done subsequent to that time; but this is not the general rule, as liens usually attach and take precedence according to the order of their being filed. The statutes of the States vary in their details as to procedure, time of filing, etc., and must be consulted to ascertain those particulars. See GARNISHMENT; LIEN; MORTGAGE.

MECHANICS OF DEVELOPMENT. This term, or Entwicklungsmechanik of the German embryologists and cytologists, is in frequent use, suggested by the changes undergone during cell division (see MITOSIS) and also in the egg of all animals previous to and following fertilization. These changes are so orderly and complex as to suggest mechanical causes for them. As early as the first quarter of the last century Pander (1817) inquired into the mechanics of development, and Lotze followed him with some luminous suggestions. The subject was continued by His and by Rauber, Van Beneden, and more recently through observation and experiments in artificial fertilization and in animal grafting carried on by O. Hertwig, Boveri, Fol, Bütschli, Pfüger, Born, Roux, Driesch, Schultze, Gerlach, Wilson, Loew, and others. Thus, Bütschli by his researches on foam has shown that the forms of the ameba and other Protozoa may be due to mechanical causes of the environment. His studies may be called protoplasmic mechanics. Here also come in the suggestions of Herbert Spencer and of Ryder as to the mechanics and mathematics of the initial steps taken during the growth of organisms. See GROWTH.

MECHANICSVILLE, mē-kān'iks-vīl. A village in Saratoga Co., N. Y., 19 miles north of Albany, on the Hudson River and the Champlain Canal and on the Delaware and Hudson Company and the Boston and Maine railroads (Map: New York, G 5). It has a public-school library and fine municipal and high-school buildings. The

industrial interests are favored by abundant water power and include extensive manufactures of pulp and paper, knit goods, sash and blinds, shirts and collars, metal goods, brick, iron beds, and mattresses. The water works are owned and operated by the municipality, which has adopted the commission form of government. Pop., 1900, 4695; 1910, 6634.

MECHANICSVILLE, BATTLE OF. A battle fought at Mechanicsville, on the Chickahominy River, 7 miles from Richmond, Va., June 26, 1862, between a Federal force of about 5000 under the immediate command of General Fitz John Porter and a Confederate force of about 10,000. The Confederates, under A. P. Hill, made a fierce and reckless attack on the strong Federal position, but, after suffering great loss, were finally driven back. Early on the morning of the 27th, however, General Jackson with a strong Confederate reinforcement having arrived in the vicinity, General Porter abandoned his position for a stronger one several miles to his rear, where later in the day he was again attacked. (See GAINES'S MILL.) In the engagement at Mechanicsville the Federals lost about 360, the Confederates about 2000. The engagement was the first of the so-called Seven Days' Battle of the Peninsular campaign, and is sometimes known as the battle of Beaver Dam Creek. Consult: Ropes, *The Story of the Civil War*, part ii (New York, 1907); Alexander, *Military Memoirs of a Confederate* (New York, 1907); Steele, *American Campaigns* (Washington, 1909).

MECHANISM, mēk'a-nīz'm (Lat. *mechanisma*, contrivance, from Gk. μηχανή, *mēchanē*, device). In philosophy often this term is employed to designate any view which seeks to explain the universe in terms of the machinery of its processes, and, as this machinery is understood only in its movement, mechanism is frequently restricted to designate the view that the universe is a vast system of motions. In this sense mechanism is practically equivalent to materialism (q.v.). It is, however, often used as a synonym for naturalism (q.v.); in this latter sense its usual antonym is teleology (q.v.). The modern physical sciences have been elaborated on a mechanistic basis in the sense that the fundamental formulas of physical science are kinematic and kinetic formulas. Now the question arises whether in biology and in psychology these same formulas hold good: they may not be alone in being applicable to biological and psychological facts, being counteracted by vitalistic and conscious forces. The mechanist maintains that they and they alone are applicable everywhere and that there are no non-mechanistic forces, such as vitalism, opposed to mechanism. Such a contention is unobjectionable, provided "mechanism" be held as an elastic conception and not exclusively identified with the methods of behavior of matter in its inorganic forms. If mechanism be rigidly confined to denote the laws of inorganic matter, then it is sheer dogmatism to insist that these are the only laws of matter. One of the most satisfactory discussions of this subject is given by Prof. H. S. Jennings. "Does not the knowledge of the properties of matter given by physics and chemistry show that the phenomena of life cannot be considered manifestations of the properties of matter? This question is based on the abandonment of the radically experimental point of view. What the properties and activities of matter are can be known only through

experience. Knowledge so acquired has the same validity when the matter examined is in the combinations called living, as in other conditions . . . if reproduction, regulation, sensation, thought, and the like so occur and are not identifiable with the activities of matter known in physics and chemistry, then they are merely to be added to the latter, on the same footing. It is a vulgar error to assume that if in certain combinations matter is 'inert and lifeless' it must be so in all. Matter has precisely the characteristics that we find it to have. Development, regulation, purpose, consciousness, reason—these are not annulled or altered by the discovery that they are bound up with the phenomena called matter; such discovery changes our knowledge of matter. It is no more and no less extraordinary that they should occur in connection with the phenomena we call matter than separately. What we find throughout the scale is that matter in certain combinations manifests certain activities; in other combinations, other activities. The more complex the combination the more complex and varied the activities. The union of many of the most complex substances in certain arrangements ('structure') gives the phenomena of life; observation of this fact stands on the same footing as observation of the gravitation or extensibility of matter." In other words, the ascertained properties of *living* matter are properties of *living matter*. Now, if we choose to give the name of mechanism to the orderly procedure of matter wherever found, then mechanism is an adequate system of categories; but it must be remembered that it is, from the point of view of the development of knowledge, a growing system. We do not know all about mechanism and cannot predict with infallibility what under new conditions may occur. If on the contrary we mean by mechanism a definite number of already ascertained laws of material behavior, then mechanism is a partial truth, perhaps limited in its range just to those phenomena which have yielded to us the knowledge of these laws.

Much has been made of the opposition between mechanism and teleology. In this antithesis it is generally stated that a mechanistic view of the universe admits of the absolute predictability of the future, whereas the teleological view leaves room for unforeseeable novelties. If mechanism means predictability with the help of such laws as we have, then we must admit that mechanism is absolutely false. Nobody with our body of science can predict the future except in a most general fashion. But predictability presupposes *knowledge* of the laws in accordance with which an event is to occur, and an empiricist admits that laws must be obtained from experience. New laws therefore are possible, and the fact that prediction is impossible in the absence of knowledge of such laws is no proof that the unpredictable is not going to be determinate and orderly in its behavior. Mechanism as naturalism is thoroughly consistent with the recognition of purpose provided purpose occurs in accordance with law.

Among the most prominent recent opponents of mechanism the best known are Bergson and William James (qq.v.). Both have identified mechanism with predictability. In doing this they have had some justification in the claims of mechanists themselves.

James, *Pluralistic Universe* (ib., 1909); Henri Bergson, *Time and Free Will*, translated from the French (ib., 1910); id., *Creative Evolution*, translated from the French (ib., 1911); William James, *The Will to Believe* (new ed., ib., 1912); J. S. Haldane, *Mechanism, Life, and Personality* (ib., 1914); Jennings, "Life and Matter," in *Johns Hopkins University, Circular No. 10*, N. S. (Baltimore, 1914).

MECHANOTHERAPY, mēk'ā-nō-thēr'ā-pī. A form of physical therapeutics which may be defined as a species of gymnastics in which the movements are applied mechanically with "fixed duration, direction, and purpose" (Ling) either by the hand of the operator or by means of specially devised machines. A systematic employment of such exercise is the object of the so-called Swedish movements, a development of massage. To Pehr Henrik Ling (q.v.), born in 1776, in Småland, Sweden, belongs the credit of systematizing this form of mechanical therapy. According to his definition a movement consists in a change of the body or part of it from one position to another under certain definite conditions, the movement beginning with a fixed position of the body except the part to be manipulated. Ling recognized five principal positions of the body (lying, kneeling, sitting, standing, and hanging), with many secondary positions; and three principal movements (flexion, extension, and rotation), with numerous subvarieties, all of these movements being in accordance with the natural motion of the parts. *Passive* movements are performed by the operator without the patient's volition. *Active* movements are performed by the patient of his own will and volition, unhindered and unaided by the operator. A *concentric* movement is made when the patient overcomes resistance while performing a movement; if, on the other hand, the patient resists the efforts of the operator to flex or rotate certain muscles the movement is called *eccentric*. According to a strict definition, massage is not included under mechanotherapy; but modern systems of physical therapeutics often combine the various movements with massage, baths, electricity, and vibration. The benefits derived are the same as those conferred by other forms of exercise (q.v.).

A great number of devices for self-massage or exercise have been introduced; the "cannon ball" for abdominal massage in cases of constipation is a familiar example. Rowing machines and pulleys, elastic or weighted, are found in most gymnasia. Mechanotherapy, however, has probably reached its highest development in the ingenious inventions of Dr. Gustaf Zander, of Stockholm. About the middle of the last century Zander introduced the first of these contrivances for administering the well-known Swedish movements. From crude beginnings he developed his system until he had perfected over 70 varieties of apparatus, some of them weighing nearly a ton, by which the most delicate child and the most unwieldy adult can be treated with equal ease and advantage. These machines range from a simple apparatus for moving a single joint or group of muscles to complicated mechanisms which closely imitate the motion of the body performed on horseback or even camel riding—the latter technically known as "trunk circumduction." Zander institutes have been established in all the important cities and health resorts in Europe, while in the United States some of the large hospitals have a department

devoted to this work. Among these are the Neurological Hospital and the Montefiore Home in New York City and the Massachusetts General Hospital in Boston.

Mechanotherapy is not designed, nor should it be resorted to, as a substitute for the natural, unconscious exercise in the open air, such as is obtained in the various outdoor recreations, but is applicable to those suffering from general weakness, or from affections of particular portions of the body, such as local paralysis or joint affections, which would render general movement painful, harmful, or impossible. Another large class of persons who are likely to find benefit are those who are afflicted with deformities, due either to habit or disease. In such cases the orthopedist often finds a valuable ally in the "movement cure." The subject is intimately related to massage (q.v.). For fuller information, consult: Graistrom, *Mechano-Therapy* (2d ed., Philadelphia, 1904); Nissen, *A Manual of Instruction for Giving Swedish Movement and Massage Treatment* (ib., 1906); Juettner, *Modern Physiotherapy* (Cincinnati, 1908).

MECHERINO, māk'ā-rē'nō, IL. A name sometimes applied to the Italian painter Domenico Beccafumi (q.v.).

MECHITARISTS. See MEKHITARISTS.

MECHLIN, mēk'lin, or **MALINES**. One of the chief cities of the Province of Antwerp, Belgium, situated 13 miles south-southeast of the city of Antwerp, on the navigable river Dyle, which flows through the city in a number of arms (Map: Belgium, C 3). The city is circular in shape, has broad and regular streets, and is surrounded by a canal and a wide boulevard. As the see of the Cardinal Primate of Belgium, it retains a considerable ecclesiastical importance; of its numerous churches the most noteworthy is the cathedral of St. Romauld, a vast Gothic structure of the sixteenth century, adorned in the interior with many fine paintings and choice carvings, its altarpiece, "The Crucifixion," by Van Dyck being one of that master's finest works. Its chimes rival any in Belgium. One tower, 320 feet in height, remains unfinished. Other buildings are the churches of St. John and of Our Lady, the latter containing "The Adoration of the Magi" and the "Miraculous Draught of Fishes" by Rubens; the town hall, dating from the fifteenth century, and known as the Beyard; the palace of justice; the market hall, erected in 1340; the lodge of the Teutonic Order, the old cloth hall; and the splendid modern archiepiscopal palace. Mechlin has an archiepiscopal seminary with a library of 31,000 volumes, an academy of painting, an academy of music, a Gymnasium, an atheneum, a museum, and a botanical garden. It was formerly the seat of important lace manufactures, but its chief products now are caps and woolen goods, Gobelin tapestry, linen, furniture, carpets, candles, needles, large bells, tobacco, starch, and beer. There are also extensive railway shops outside the city. Mechlin was occupied by the Germans during their advance on Antwerp in the European War which broke out in 1914. It was recovered by the Belgians by a sally in force from Antwerp. After a heavy bombardment, which destroyed the greater part of the city, it again fell into the hands of the Germans. See WAR IN EUROPE. Pop., 1900, 56,013; 1910, 59,191.

MECHLIN LACE. A lace so named from being originally manufactured at Mechlin in Belgium. It is a hexagon mesh of three threads

in which the pattern is worked. The mesh has four plaited and two twisted sides. See LACE.

MECKEL'S GANGLION, or THE SPHENOPALATINE GANGLION. The largest of the four sympathetic ganglia connected with the fifth cranial nerve, the others being the ophthalmic (q.v.), the otic (q.v.), and the submaxillary (q.v.). It lies deep in the sphenomaxillary fossa (a small triangular space just beneath the apex of the orbit), close to the sphenopalatine foramen. The ganglion is a small triangular or heart-shaped body, of a reddish-gray color, and was first described by Meckel. Like the other ganglia of the fifth nerve, it possesses a motor, a sensory, and a sympathetic root. Its sensory root is derived from the superior maxillary branch of the fifth nerve, through its two sphenopalatine branches; its motor root from the facial nerve, through the large superficial petrosal nerve; and its sympathetic root from the carotid plexus, through the large deep petrosal nerve. The ganglion gives off branches of distribution in four groups—an ascending group, which passes to the orbit; a descending, to the palate; an internal, to the nose; and posterior branches to the pharynx and nasal fossæ. See NERVOUS SYSTEM AND BRAIN.

MECKLENBURG DECLARATION OF INDEPENDENCE. In American history, a series of resolutions purporting to have been adopted at Charlotte, Mecklenburg Co., N. C., May 20, 1775, by a convention of delegates representing each militia company of the county. Another set of resolutions is attributed to a similar meeting on May 31, 1775, but the use at that time of both modes of reckoning time makes it probable that only one meeting was held, although this has always been a debatable question and has given rise to a detailed and prolonged controversy. The copy of the resolutions made by the secretary of the meeting is said to have been destroyed by fire in 1800, but on April 30, 1819, what purported to be a copy, made probably from recollection, was published in the Raleigh (N. C.) *Register*. The use of phrases in the published copy similar to certain passages in the real Declaration of Independence of July 4, 1776, caused doubt to arise as to the authenticity of the Mecklenburg Declaration. The Legislature of North Carolina in 1831, after an investigation of the subject, declared May 20 a legal holiday. The weight of authority at present is overwhelmingly against the authenticity of the Declaration and favors the opinion that only one meeting was held—the one of May 31—and that the resolutions there adopted, bearing no resemblance to Jefferson's Declaration, constitute the nearest approach there was to a Mecklenburg Declaration of Independence. The resolutions, as published in the Raleigh *Register* in 1819, are five in number. They declare: (1) that whoever aids or abets the invasion of American rights is "an enemy to this country—to America—and to the inherent and inalienable rights of man"; (2) that all political bonds between those passing the resolutions and the mother country are dissolved, the allegiance of the citizens of Mecklenburg County to the British crown being absolved and all political connection with that nation broken off; (3) that "we do hereby declare ourselves a free and independent people; are, and of a right ought to be, a self-governing association, under the control of no power other than that of our God and the general government of the Congress; to the main-

tenance of which independence we solemnly pledge to each other our mutual coöperation, our lives, our fortunes, and our most sacred honor"; (4) that those passing the resolutions acknowledge the existence of no law or public officer, but readopt their former laws in so far as these laws do not recognize the authority of the crown, thus vacating all civil and military commissions granted by the crown; and (5) that all military officers in the county are retained in their former command and that every member of the convention be henceforth a civil officer with power to issue process, hear and determine all matters of controversy, preserve peace and harmony, and endeavor to spread the love of country until a more general organized government be established in the province.

Bibliography. W. M. Hoyt, *The Mecklenburg Declaration of Independence* (New York, 1907), is an able study, and sufficient to convince most historians that the Declaration of May 20 is spurious. G. W. Graham, *The Mecklenburg Declaration of Independence, May 20, 1775, and Lives of its Signers* (New York, 1905), and J. H. Moore, *Defense of the Mecklenburg Declaration of Independence* (Raleigh, 1908), are the ablest attempts to prove that it is authentic.

MECKLENBURG-SCHWERIN, mēk'len-burk-shvā-rēn'. A grand duchy and constituent state of the German Empire, bounded by the Baltic Sea on the north, the Prussian Province of Pomerania and the Grand Duchy of Mecklenburg-Strelitz on the east, the Prussian provinces of Brandenburg and Hanover on the south, and Schleswig-Holstein, the Principality of Ratzeburg (belonging to Mecklenburg-Strelitz), and the territory of Lübeck on the west (Map: Germany, E 2). Area, including the three enclaves in Brandenburg and Mecklenburg-Strelitz, 5068 square miles.

The country is generally flat, with the exception of the central part, which is traversed from southeast to northwest by a chain of low hills, forming the watershed between the Elbe and the Baltic Sea. The flat coast line is 100 miles long and is broken by a number of deep indentations, including the Bay of Wismar. Numerous rivers traverse the country from north to south. The Recknitz, the Warnow, and the Stepenitz flow towards the Baltic, and the New Elde and the Sude are tributaries of the Elbe, which for a few miles forms the south boundary of the grand duchy. The country abounds in lakes (650 in round numbers) of glacial origin, the largest of which are the Müritz See (51 square miles), the Schweriner See (23 square miles), the Kölpiner, and the Plauer See.

The climate is mild and healthful, although somewhat raw. The average annual temperature is 46° F. and the annual precipitation 21 inches. There are chalybeate springs at Doberan and Goldberg and saline springs at Sülze. According to the industrial census of 1907 nearly one-half of the population depended for their livelihood on agriculture. The land is divided between the crown, the aristocracy, the clergy, and the towns, the peasantry forming an hereditary tenantry class. About 90 per cent of the area is under cultivation in pastures and in forests. The crops exceed the local demand and are partly exported. Rye, wheat, oats, barley, sugar beets, and potatoes are the staples. Tobacco is cultivated to some extent. Stock raising is carried on extensively, and dairying is an important adjunct to agriculture.

The manufacturing industries are far inferior to the agricultural interests. There are a number of foundries, machine works, sugar refineries, breweries, distilleries, paper mills, tanneries, tobacco factories, brickyards, etc.; but many manufactures are imported for local consumption, and the native exports contain no manufactured product of importance. The trade is very extensive and favored by the situation of the country. The imports pass chiefly through the seaports of Warnemünde and Wismar. The chief exports are agricultural, dairy, and animal products, live animals, etc., and are transported mostly by rail. The outward and inward shipping was 2,429,963 tons in 1910. The transportation facilities are excellent, consisting of a system of navigable rivers and canals and a number of state railway lines with a total length of 1094 miles in 1914.

The constitution of the two duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz is based on the agreement concluded in 1755 between the Duke of Mecklenburg-Schwerin and his estates and adopted in the same year by the Duchy of Mecklenburg-Strelitz. The crown is hereditary in the male line in both duchies and on the extinction of the reigning dynasty in either state the succession reverts to the other house. In the case of the extinction of both houses the right of succession passes to Prussia. The government of the two Mecklenburgs is semifederal in character, and the proprietors of the land, whether belonging to the nobility or not, are endowed with many special privileges. The common assembly, or Landesunion, of both grand duchies consists of the representatives of the landed aristocracy, or Ritterschaft, and the burgomasters of 49 towns, or the Landschaft. The tenants of the royal domains are not represented.

The assembly convenes every year for a short period, alternately at Sternberg and at Malchin. There are also a permanent committee of nine members at Rostock representing the two estates when the Landtag is not in session, and convocation and deputation diets which can be assembled for special purposes in either of the duchies. The Principality of Ratzeburg is under the direct authority of the Grand Duke of Mecklenburg-Strelitz. The executive authority in Mecklenburg-Schwerin is vested in a cabinet of four ministers. Mecklenburg-Schwerin is represented by two members in the Bundesrat and sends six deputies to the Reichstag. These are the only elective offices in the duchy. The capital is Schwerin; the summer residence of the Grand Duke is Ludwigslust.

The two duchies have two separate systems of lower courts and a common supreme court at Rostock. There is no general financial system in the Grand Duchy of Mecklenburg-Schwerin. The revenue is divided into three classes, of which by far the largest (derived from the royal domains and ordinary taxes) is under the sole control of the Grand Duke. A part of it goes to cover the ordinary expenses of the government. The total public debt, incurred to some extent for the purchase of railways, amounted to approximately \$32,717,025 on July 1, 1913. General and technical education is on a high plane. The university at Rostock (q.v.) provides higher education. Pop., 1900, 607,770; 1910, 639,958, of which 96 per cent were Protestant.

History. The territory of Mecklenburg was anciently occupied by Germanic peoples, and at

the beginning of the Middle Ages the Wends, Obotrites, and other Slavic tribes took possession of the region. The Slavic inhabitants long resisted the power of Germany, but were finally subdued in the second half of the twelfth century by Henry the Lion, Duke of Saxony. Henry left a part of the country (which took its name from Michilenburg, the principal settlement of the Obotrites, near the modern Wismar) under the rule of the Obotrite princes, while at the same time the Germanization of the region was prosecuted. After 1229 the territory was frequently divided and subdivided among the descendants of the original Slavic rulers. In 1348 Mecklenburg was elevated into a duchy by the Emperor Charles IV. In 1363 Albert III, Duke of Mecklenburg, was called to the throne of Sweden, but in 1389 was dethroned by Margaret, Queen of Denmark and Norway. In the middle of the sixteenth century Lutheranism was made the established religion in Mecklenburg. About this time there was a division into the two ducal lines of Mecklenburg-Schwerin and Mecklenburg-Güstrow. In the Thirty Years' War the dukes of Mecklenburg joined Christian IV of Denmark in the struggle against the Roman Catholic powers and, as a result, were deprived of their possessions, which were conferred in 1629 upon Wallenstein. In 1631, however, the dukes were restored by Gustavus Adolphus of Sweden. After various subdivisions of the ducal line into the branches of Schwerin, Strelitz, and others, and the successive extinction of several of these collateral houses, the Imperial Commission, which met at Hamburg in 1701, brought about a family compact, by which it was arranged that Schwerin and Güstrow should form one duchy and Strelitz with Ratzeburg, Stargard, etc., another. In 1815 the dukes of both the Mecklenburgs assumed the title of Grand Duke. Frederick Francis (1785-1837), Grand Duke of Mecklenburg-Schwerin, abolished serfdom in his dominions, to which he added Wismar. The reign of Frederick Francis II (1842-83) of the same duchy, who succeeded his father, Paul Frederick, was disturbed by a contest between the nobles and the burghers and smaller landowners. The revolutionary movement of 1848 gave a fresh stimulus to the popular ferment in both duchies, and the disturbances could only be quelled by the intervention of the Prussian troops; but a reaction took place in 1850 and matters were restored to their former condition. Frederick Francis II (q.v.), Grand Duke of Mecklenburg-Schwerin, was one of the principal generals in the Franco-German War of 1870-71. As members of the German Empire, the two duchies have maintained their internal constitution very much on the old footing. Consult Wilhelm Raabe, *Mecklenburgische Vaterlandskunde* (2d ed., 3 vols., Wismar, 1894-96).

MECKLENBURG-STRELITZ, -strä'lits. A grand duchy and constituent state of the German Empire, consisting of the grand duchy proper, bounded by the Prussian provinces of Pomerania and Brandenburg and the Grand Duchy of Mecklenburg-Schwerin, and of the Principality of Ratzeburg, which is separated from it by the width of Mecklenburg-Schwerin and bounded by Lauenburg and the free town of Lübeck (Map: Germany, E 2). Total area, 1131 square miles. In the formation of its surface the grand duchy proper resembles Mecklenburg-Schwerin. It is watered chiefly by the Havel and the Datze and contains numerous

lakes. The Principality of Ratzeburg is watered by a tributary of the Stepenitz.

Agriculture is the chief occupation, and the system of land tenure does not differ from that prevailing in the Grand Duchy of Mecklenburg-Schwerin, though the trade is less developed, but there is considerable inland traffic, and the railway facilities are good. Mecklenburg-Strelitz is governed by the same constitution as Mecklenburg-Schwerin (q.v.). The executive power is vested in a Minister of State and a small council. Capital, Neustrelitz. The financial system also resembles that of Mecklenburg-Schwerin. Mecklenburg-Strelitz is represented by one member in the Bundesrat and returns one deputy to the Reichstag. Pop., 1910, 106,347, almost exclusively Protestant. For history, see MECKLENBURG-SCHWERIN.

MECONIC ACID (Gk. *μηκωνικός, mēkōnikos*, pertaining to the poppy, from *μήκων, mēkōn*, poppy), $C_7H_4O_7 + 3H_2O$. An acid existing in opium, which, when good, yields from 6 to 8 per cent of it. Both the acid and its salts assume a characteristic blood-red tint with ferric salts; and this test, which is very sensitive, is employed by the toxicologist in searching for traces of opium. As, however, the alkaline sulphocyanides which exist normally in the saliva give a precisely similar tint with the ferric salts, it is necessary to be able to distinguish the meconate or iron from the sulphocyanide of iron. A solution of chloride of gold or of corrosive sublimate removes all doubt by discharging the color of the sulphocyanide but not affecting the color of the meconate of iron. The constitution of meconic acid is represented by the formula $C_7H_4O_7$ (OH) (COOH)₂, showing it to be chemically a monohydroxy-dibasic acid. The alkaloids morphine, codeine, narcotine, thebaine, papaverine, and others exist in opium in combination partly with meconic, partly with sulphuric, acid.

MECONIUM (Lat., from Gk. *μηκόνιον, mēkōnion*, poppy juice, from *μήκων, mēkōn*, poppy). The earliest matter discharged from the bowels of a newborn infant. It is of a brownish-green or almost black color, acid, devoid of odor, and rapidly putrefies on exposure to air. It is usually regarded as a product of the foetal liver. It contains biliary salts and bile pigments and an abundance of desquamated epithelium of a green tint, of mucus corpuscles, and of fat, with which there is a good deal of cholesterine (7 per cent).

MEDAD. See ELDAD AND MEDAD.

MEDAL (OF. *medaille*, Fr. *médaille*, from Lat. *metallum*, from Gk. *μέταλλον, metal*). A piece of metal, more or less of the form of a coin, stamped on one side or both with image and inscription, with the object of commemorating an event or of honoring a person, and not intended for circulation as money. This use of the word excludes all ancient and modern coins, even those which, like the American Columbian half dollar, are commemorative pieces struck only for a special occasion but designed for circulation as money. The coins of the Greeks and the Romans have so many medallie, i.e., commemorative, characteristics, that the belief once held that they were really medals rather than coins was a natural one; as a result of that belief the word medal long meant coin, as in the title of Addison's *Dialogues on Medals*. (See NUMISMATICS, *Material of the Study; Nomenclatures*.) There is hardly any event of popular

interest, whether public or private, in ancient times, especially under the Roman Empire, that is not recorded on the coins. The term *medallion* is for convenience still used of certain classes of ancient coins that surpass the rest in size and technique; but the strictly monetary character of even these is now sufficiently proved. Though objects of real art, often designed for royal gifts or for ornament, they were still multiples of the regular coins, and as such could be entered into circulation. Such were the magnificent "medallions" of Syracuse, real gems of the die engraver's art signed with the artist's name, and the "medallions" in gold, silver, and copper of the Roman Emperors, coined under their special control, and hence lacking the usual S. C. (*Senatus consulto*, "by order of the Senate") of the senatorial bronze money. Sometimes these Roman medallions are found set in a circlet of fine metal. This was not the work of the coiner, however, but of the jeweler who adapted the coin to artistic use. For another use of the term "medallion," see MEDALLION. If we are to seek anything approximating the medal in ancient times, it may perhaps be found in certain pagan talismans and in the little Christian medals of devotion.

Modern medals begin in the period of the Renaissance. The earliest bear the portraits and inscriptions (in Latin) of rulers and potentates. The subjects are at first drawn exclusively from classical art; hence their value as documents of contemporary history, though not as documents of art, is materially lessened. The most famous Italian medalist of the fifteenth century was Vittorio Pisani, of Verona, whose splendid works are signed "Opus Pisani Pictoris." It became the custom for a ruler to inaugurate his reign and celebrate its chief events by striking medals. The series of the popes begins with Paul II (1464-71) and continues without a break to the present time. Medals of popes earlier than Paul II are the work of a later period. A medallie mint is connected with the Vatican, where the best artists are employed. Some of the medals of Julius II, Leo X, and Clement VII have an especial interest as having been designed by Raphael and Giulio Romano and engraved by Benvenuto Cellini. A sixteenth-century medal of Sicily is probably the first instance in modern times of the use of a medal as a vehicle of political satire; it is directed by Frederic II against his adversary, Ferdinand of Spain. Satirical medals were afterward common in the Low Countries. Some of the Dutch medals are noted for the elaborate views, maps, and plans engraved on them. Of many reigns a complete medallie history can be written, as, e.g., of that of Napoleon Bonaparte. American Presidents, beginning with Washington, are commemorated in a series of portrait medals. But it is no longer merely kings and rulers and great military and naval events that are commemorated in medals. Events of general interest in science, art, or literature, movements for the amelioration of conditions, learned societies, are all found recorded in these artistic little documents of history.

Besides the purely commemorative medals there is another class—that of "decorations"—which, beginning at the end of the eighteenth century, has attained an enormous development. These are conferred by the sovereign or the state as marks of distinction for eminent services, particularly in the army and the navy. Such

medals of honor are seldom of much intrinsic value, their worth depending mainly on the associations connected with them. They have ribbons attached, with clasps or small bars, each of which often bears the name of a battle. Such medals are intended to be worn on the breast. They are of very varied form, the cross being the most common. See **LEGION OF HONOR**; **MEDAL OF HONOR, UNITED STATES**; **MEDAL OF HONOR LEGION**; **ORDERS**; **VICTORIA CROSS**.

H. Long, *British Navy Medals and how they were Won* (London, 1895); D. H. Irwin, *British War Medals and Decorations* (2d ed., London, 1899); Max Bernhart, "Medaillen und Plaketten," in *Bibliothek für Kunst- und Antiquitätensammler*, vol. i (Berlin, 1911); G. F. Hill, *Portrait Medals of Italian Artists of the Renaissance* (New York, 1912). There is a series of articles by Marvin on Masonic medals in the *American Journal of Numismatics*, vols. x-xiv, xxii-xxxvi (Boston, 1876-80, 1888-1902).

MEDAL'LION (Fr. *médailon*, augmentative of *médaille*, medal). In architecture, a circular or oval panel carved in bas-relief with a head, bust, figure, ornamental design, etc. The term is also used of a similar design in color.

MEDAL OF HONOR, UNITED STATES. The medal of honor of the United States, given for bravery on the field of battle, was first instituted in 1862 by a law approved July 12 of that year. It is authorized by Congress and is awarded in the name of Congress for particular deeds of most distinguished gallantry in action. The New Medal of Honor, adopted 1905, is a five-pointed star of rose-gold finish. On the medallion in centre is the head of Minerva in bold relief, surrounded by a band bearing the inscription "United States of America." Upon each point of the star is an oak leaf. The star is encircled by a green-enamel laurel wreath. Surmounting the star and wreath is an eagle resting on a bar, upon which "Valor" is in raised letters. The decoration is pendent from a concealed pin by blue-silk watered ribbon, upon which are emblazoned 13 stars in white. The reverse side is plain for engraving the name of recipient, which is preceded by the inscription "The Congress to —." The medal is worn with the full-dress uniform and the special evening dress, pendent from the neck about 1 inch below the opening of the collar. It will not be worn by officers suspended from rank and command, nor by enlisted men serving sentence of confinement. On March 25, 1776, before even independence had been proclaimed, Congress ordered that a gold medal be struck and presented to General Washington. Benjamin Franklin, who at the time was in Paris, was instructed to employ the greatest artists in France to execute a suitable design. Although this was the first medal voted, the first one struck was a

silver medal presented to Lieutenant Colonel Fleury, a volunteer officer from the French regular army, who, entering the United States army in 1777 as a private, distinguished himself so greatly and rendered such valuable services that Congress promoted him to be lieutenant colonel. For his gallantry in the assault upon Stony Point, July 15, 1779, Congress voted him a silver medal, and afterward a vote of thanks. It was not until the institution of the medal of honor that the United States possessed a military equivalent to the Victoria cross (q.v.) of England or the iron cross (q.v.) of Prussia. Like the former decoration, it is bestowed on both commissioned and noncommissioned ranks alike, the decoration being the same in every instance. Medals of honor are only awarded to officers or enlisted men for most distinguished personal bravery or self-sacrifice which has been manifested in action, by conduct distinguished above the others, and that involved risk of life, or service more than ordinarily hazardous the omission of which would not justly subject the person to censure. An interesting account of the deeds by which the medal of honor has been won will be found in Rodenbough, *Uncle Sam's Medal of Honor* (New York, 1886). Consult *United States Army Regulations*, 1913.

MEDAL OF HONOR LEGION. A patriotic society whose membership comprises officers and enlisted men who have received the medal of honor (q.v.). The society was originally organized in 1890 to admit those who had participated in the Civil War, but the membership was subsequently extended to include all who have received the medal of honor, regardless of the war in which they engaged. The number of members on the rolls in December, 1914, was about 400.

MEDANO, mǎ-dǎ'nō. A Spanish term applied to the curious traveling, crescent-shaped sand hills which occur in numbers on the elevated pampa of Islay, near Arequipa, Peru. They move across the desert from south to north in the direction of the prevailing day wind. They are composed of a white sand apparently quite different from that which makes up the rest of the desert surface.

MED'ARY, SAMUEL (1801-64). An American editor and politician. He was born in Montgomery Co., Pa., and began newspaper work at 16 years of age. In 1825 he removed to Ohio and in 1828 became editor of the *Ohio Sun*, a Democratic paper. After serving in both Houses of the Ohio Legislature he was editor from 1836 to 1857 of the *Ohio Statesman*, which became a great power in the West and Southwest. He was high in the confidence of President Jackson and the succeeding Democratic Presidents, and is said to have originated the phrase "Fifty-four forty or fight" during the Oregon boundary dispute. In 1844 he was chairman of the Democratic National Convention held at Baltimore and secured the enthusiastic nomination of James K. Polk for the presidency by reading a letter from Andrew Jackson in which Polk was recommended for that office. In 1853 Medary declined the position of United States Minister to Chile. He was the last territorial Governor of Minnesota in 1857-58, was postmaster of Columbus, Ohio, in 1858, and was Governor of Kansas Territory in 1859-60, when he resigned to found the *Crisis*, which he continued to edit until his death. The Ohio State fairs owe their origin largely to him. He helped Samuel F. B. Morse

in his struggle to make a success of the electric telegraph. The Democrats of Ohio erected a handsome monument to Medary's memory at Columbus.

MEDE, JOSEPH. See **MEAD, JOSEPH.**

MEDE'A (Lat., from Gk. *Mēdeia*, *Mēdeia*). In Grecian legend, a famous sorceress, the daughter of Æetes, King of Colchis, and of the Oceanid Idyia, or of Hecate, and niece of Circe. On the arrival of the Argonauts (q.v.) at the court of Æetes, in search of the Golden Fleece, she fell in love with Jason, aided him by her magic arts to perform the tasks set him, and finally to carry off the fleece. Pursued in her flight with the Argonauts by her father, she killed her brother Absyrtos and scattered the fragments of his body on the sea. Since her father paused to gather up the remains, the Argonauts gained time for their escape. On the return of Jason to Iolcus, she aided him to take vengeance on Pelias, who had murdered Jason's parents. Having cut up an old sheep and boiled the pieces with magic herbs, she brought forth from the caldron a young lamb, an incident represented not infrequently on Greek vases. She then easily persuaded the daughters of Pelias to cut their father in pieces, that by the same process he might regain his youth; but when they had yielded she refused to employ her art. For this she and Jason were forced to flee to Corinth, where Jason repudiated Medea to marry Glauce, or Creusa, the daughter of the King. Medea sent her rival a poisoned robe and crown, whereby both the princess and her father were destroyed. To complete her revenge, she then slew the children she had borne Jason, and fled on her dragon chariot to Athens, where she was received by King Ægeus, to whom some said she bore a son, Medos. On the arrival from Træzen of Theseus, the son of Ægeus, she plotted against his life, but was discovered, and with her son fled back to Colchis and restored her father to the throne, of which he had been deprived by his brother Perses. Story said also that Medos gave his name to the Medes. As a sorceress she seems, like Circe, immortal in some of the writers, while others regarded her as a heroine and united her to Achilles in the Elysian fields. These outlines of the legend were often very variously filled in, and it is clear that in the story many elements are combined. Much points to an original divinity sunk to heroine (she was honored as a goddess at Corinth), as is so often the case, and much also to an original good sorceress, a counterpoise to the wicked Circe. Medea was especially honored in Thessaly, the home of magic. The attempts to interpret the myth in the light of natural phenomena (some scholars have regarded Medea as a moon goddess) cannot be regarded as successful. The figure of Medea was a favorite one in art, especially with the vase painters. The Corinthian episode is common on Roman sarcophagi. It attained especial prominence through the great tragedy *Medea*, by Euripides (q.v.). Medea's story is told at length by Ovid, *Metamorphoses*, vii, 1-348, and *Heroides*, xii. Ovid also wrote a tragedy called *Medea*, as did Seneca the philosopher; of these the latter is extant, but the former is lost. The story of Medea has been handled in modern times by T. Corneille and F. Grillparzer, and in an opera by Cherubini. Consult: Léon Mallinger, *Médée: étude sur la littérature comparée* (Paris, 1898); the editions of the *Argonautica* of Apollonius Rhodius and

of the *Medea* of Euripides, especially the edition of the latter by M. L. Earle, pp. 32-62 (New York, 1904); the article "Medeia" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MEDEA. 1. A tragedy by Euripides represented in 431 B.C., when it obtained only the third prize. The delineation of the passionate heroine makes it one of the most famous of Greek tragedies. Euripides' *Medea* was translated into Latin by Ennius. 2. A play of considerable power by Seneca, 1027 lines in length. It is only occasionally like the play of Euripides. It is distinguished by the beauty of its choral odes. 3. A tragedy by Richard Glover (1761).

MÉDECIN MALGRÉ LUI, mǎ'd'sǎn' mǎl'-grǎ' lwè, **LE** (Fr., The Physician in Spite of Himself). A three-act farce comedy in prose by Molière, produced at the Palais Royal in 1666. The plot is taken from an old fabliau of the thirteenth century, *Le médecin de Bray* or *Le vilain mire*. The comedy was set to music by Gounod and presented at the Opéra Comique in 1858. It was given in London as "The Mock Doctor" in 1865.

MÉDECIN VOLANT, vó'lǎn', **LE** (Fr., The Flying Doctor). A comedy by Molière (1659).

MÉDÉE, mǎ'dǎ' (Fr., Medea). The title of several French tragedies inspired by the *Medea* of Euripides. 1. A play by Jean de la Péruse (1553), a translation of Seneca's version of the tragedy. 2. A tragedy by Pierre Corneille (1635), based on Euripides with an admixture of Seneca, but with a number of new minor characters and with variations in the details of the plot. 3. A play by Clément (1779) which eliminates the supernatural features. 4. A play by Catulle Mendès, produced at the Renaissance in 1898 with Sarah Bernhardt in the title rôle. It is based on Euripides and Seneca, with modifications ingeniously introduced.

MEDELLÍN, mǎ'bǎ-lyèn'. The capital of the Department of Antioquia, Colombia, situated between the ranges of the central and western Cordilleras (Map: Colombia, B 2). It is a beautiful town, and, its elevation being about 5000 feet above sea level, the climate is pleasant. Its streets are broad and straight and it has several parks and squares adorned with handsome buildings, among which are a number of churches, a high school, a museum, and a public library. It has a college, a seminary, a school of mines, two normal schools, and a number of private schools. The manufactures of the city include cloth and clothing, chocolate, matches, cigarettes, shoes, clocks, paper, and articles of gold and silver. There are also a number of foundries. It is a growing commercial centre and is the residence of a United States consular agent. Medellín was founded in 1674. Pop., 1912, 70,547. Consult *Censo general de la república de Colombia* (Bogotá, 1912).

MEDES, mēdz. See **MEDIA**.

MEDFIELD. A town in Norfolk Co., Mass., 18 miles by rail southwest of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). It contains the Medfield State Hospital. There are manufactures of straw hats and bricks. Medfield is the birthplace of Hannah Adams, the historian, who was one of the pioneer literary women of America. Pop., 1900, 2926; 1910, 3466.

MEDFORD. A city, including the villages of Hillside, Glenwood, South Medford, Welling-

ton, and West Medford, in Middlesex Co., Mass., 5 miles north by west of Boston, on the Mystic River and on the southern and western divisions of the Boston and Maine Railroad (Map: Massachusetts, E 3). The city, which extends 4 miles in length and breadth and occupies an area of about 8 square miles, is a popular residential suburb of Boston, and the seat of Tufts College (q.v.). It has a public library; several historically interesting buildings, of which the old Cradock House, built in 1634, is said to be the oldest structure retaining its original form in the United States; Royall House; Middlesex Fells Park, Mystic Valley Parkway, Brooks Playstead, Salem Street Common, and several smaller parks; and several cemeteries, the largest of which, Oak Grove, contains about 34 acres. The principal manufactures include carriages, bricks, machinery, chemicals, dyes, calico, etc. The government is administered under the revised charter of 1903, which provides for a mayor, elected every two years, a board of aldermen, consisting of 21 members, elected for one year, seven of whom are elected at large and 14 by wards, and subordinate administrative officials. The water works are owned by the city. Pop., 1890, 11,079; 1900, 18,244; 1910, 23,150; 1914 (U. S. est.), 25,240; 1920, 39,038. Founded as Meadford by a company from Salem in 1630, Medford became a town in the following year and was chartered as a city in 1892. Consult Usher, *History of the Town of Medford, Mass.* (Boston, 1886).

MEDFORD. A city in Jackson Co., Oreg., 5 miles east of Jacksonville, on the Southern Pacific, the Pacific and Eastern, and the Rogue River Valley railroads (Map: Oregon, C 5). It contains a Carnegie library, fine Federal and high-school buildings, the Sacred Heart Hospital, St. Mary's Academy, city parks, a United States Weather Bureau station, and is adjacent to the picturesque Crater Lake, National Park, and Sugar Pine forests. Pears and apples are grown in the surrounding region and shipped from Medford in large quantities. The water-supply system, comprising 28 miles of mains, and erected at a cost of \$350,000, is owned by the municipality. Pop., 1900, 1791; 1910, 8840; 1914 (U. S. est.), 12,490.

MEDHURST, WALTER HENRY (1796-1857). An English Congregational missionary. He was born in London and went, by appointment of the London Missionary Society in 1816, to Malacca as a missionary printer. His fitness for the ministry induced the missionaries to ordain him in 1819, and he did good service in various Eastern fields, Malacca, Penang, Batavia, Parapattan, and, from 1842 to 1856, at Shanghai. For six years he performed mission work in the interior of China amid much peril. In 1847 delegates from several stations convened in Shanghai for the revision of the New Testament. In this work he was engaged until 1850, when he devoted his time to the Old Testament. In 1857 he returned to England in impaired health and died three days after his arrival. He was well versed in the Chinese, Japanese, Javanese, and other languages, besides Dutch and French, in all of which he wrote. His special works are: *An English and Japanese Vocabulary* (1830); *Dictionary of the Hokkien Dialect* (1832); *China: Its State and Prospects, with Especial Reference to the Diffusion of the Gospel* (1838); *A Chinese and English Dictionary* (1842-43); *Chinese Dialogues* (1844; new ed., 1861); *Disser-*

tation on the Theology of the Chinese (1847); *English and Chinese Dictionary* (1847-48).

MEDIA, mē'di-ā. A borough and the county seat of Delaware Co., Pa., 12 miles west of Philadelphia, on the Philadelphia, Baltimore, and Washington Railroad (Map: Pennsylvania, L 8). It is finely situated in a fertile and picturesque region and is a popular residential suburb of Philadelphia and a summer resort. The Delaware County Institute of Science, founded in 1833, has a valuable scientific library of 5000 volumes, and there are a public library and a splendid county courthouse building. The water works are owned by the municipality, also the street-lighting plant. Media, first incorporated in 1850, is governed by a chief burgess and a town council. Pop., 1900, 3075; 1910, 3562.

ME'DIA (Lat., from Gk. Μηδία, from Μηδος, Mēdos, from Opers. Māda, Mede). In ancient times, the name of the northwestern part of Iran, bounded by the Caspian Sea on the north, by Persia on the south, by Parthia on the east, and by Assyria on the west. The northern portion of the country is very mountainous; the south is a rich and fertile tract. Media covered probably the present Persian provinces of Azerbaijan, Ghilan, Ardilan, and Irak-Ajemi, and the northern portion of Luristan.

The Medians were in language, religion, and manners very nearly allied to the Persians. After they had shaken off the yoke of the Assyrians their tribes united, according to Herodotus, about 708 B.C. under Deioeces, whom later Persian tradition seeks to identify with Kai Kobad. Deioeces made Ecbatana (q.v.) his capital. He was succeeded by his son Phraortes (647-625 B.C.), whose name has been brought into possible connection with the early history of Zoroastrianism. The King who followed was his son Cyaxares, who reigned 625-585 B.C. (See CYAXARES I.). This monarch, in alliance with Nabopolassar, King of Babylon, overthrew the Assyrian Empire about 604 B.C., spread the terror of his arms as far as Egypt and the farthest bounds of Asia Minor, and vanquished the brigand hordes of Scythia, who had extended their ravages to Syria. He was succeeded by his son Astyages (585-549), in whom the later tradition apparently wrongly seeks to recognize the tyrant Azh-dahak, or Azhi-dahaka, of Babylon, who was overthrown by Cyrus (q.v.). Persia now became the mistress instead of the vassal of Media, and from this time the two nations are spoken of as one people. After the death of Alexander the Great (323 B.C.) the new portion of Media became a separate kingdom, *Media Minor*, and existed till the time of Augustus, the other portion, under the name of *Media Major*, forming a part of the Syrian monarchy. Media was on several occasions separated from Persia. In 152 B.C. Mithridates I took Great Media from the Syrians and annexed it to the Parthian Empire, and about 36 B.C. it had a king of its own, named Artavasdes, against whom Mark Antony made war. Under the Sassanian dynasty the whole of Media was united to Persia. It became, during the fourteenth and fifteenth centuries, the stronghold of the Turcoman tribes Kara-Koinlu (Black Sheep) and Ak-Koinlu (White Sheep).

In early times the Medes were a warlike race, possessed of an enthusiastic love of independence, and distinguished for their skill with the bow. They were also celebrated for their

horsemanship, and it was from them that the Persians adopted this and other favorite exercises and acquirements. Media played an important part in the early religious history of the East, when we consider that the Magi sprang from Media and Zoroaster probably arose there, although part of his activity is located in Bactria.

Bibliography. Jules Oppert, *Le peuple et la langue des Mèdes* (Paris, 1879); A. L. Delattre, *Le peuple et l'empire des Mèdes jusqu'à la fin du règne de Cyaxare* (Brussels, 1883); Z. A. Ragozin, *Media, Babylon, and Persia* (New York, 1888); Prášek, *Medien und das Haus des Kyaxares* (Berlin, 1890); Ferdinand Justi, "Das Medische Reich," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, ii (Stuttgart, 1904); Prášek, *Geschichte der Meder und Perser bis zur makedonischen Eroberung* (Gotha, 1906).

MEDIANT (It. *mediante*, from Lat. *mediare*, to divide in the middle, from *medius*, middle). The third degree of the musical scale. The chord of the mediant is the triad built upon the third degree. In mediæval music, the tone that lies midway between the final and dominant. See **MODES**.

MEDIASTINUM, mē'di-ās-ti'nūm. The space in the thorax between the lungs, divided by the heart into an anterior and a posterior portion. The anterior, which is the smaller, is occupied by the thymus gland, together with muscular and areolar tissues. The posterior or larger portion contains certain very important structures, viz., the aorta, thoracic duct, the œsophagus, trachea, the splanchnic nerves and some lymphatic glands, together with the nerves and arteries supplying them. A middle mediastinum, containing the heart and the origin of the great blood vessels and the bifurcation of the trachea, is sometimes described. The mediastinum is important surgically from its difficulty of access, the grave conditions sometimes developed in it and the difficulty of their diagnosis. The most frequent diseases developing in the mediastinum are inflammation and abscess, emphysema, aneurism, various tumors, tubercular glands and syphilitic gummata. Malignant growths in the mediastinum are apt to progress very rapidly, and in their early stages the diagnosis is obscure. In children an enlarged thymus gland may fill the anterior mediastinum, and in adults goitres sometimes extend into this space. The symptoms of growths in the mediastinum are those of mechanical pressure upon the important nerves, arteries, and other structures immediately adjacent. Among these may be mentioned cough, hæmoptysis, severe neuralgic pains, and difficult breathing.

MEDIATE (Lat. *mediatus*, p.p. of *mediare*, to divide in the middle). Under the feudal system, and especially in Germany, a term applied to those lordships or possessions which were held by feudal tenure under one of the greater vassals, and so only *mediately* under the Emperor as the supreme feudal lord. The wars of the French Revolution and Napoleon resulted in many small German states being mediatized, i.e., annexed to larger ones. When the Confederation of the Rhine was formed by Napoleon in 1806 many German cities and ecclesiastical as well as secular states were consolidated.

MEDIATE INFERENCE. See **LOGIC**.

MEDIATION. In international law the attempt of a friendly power or the sovereign of such a power to compose differences which have

arisen between two or more other powers. Mediation must be distinguished from *intervention* by the fact that the latter is always an unfriendly or at least an unwelcome act, involving usually the employment of force or the threat of force. It should also be distinguished from *good offices*, which consist in suggestions or advice made to governments at variance with each other for the purpose of inducing them by negotiation or otherwise to adjust their differences amicably, whereas mediation is more in the nature of a diplomatic intervention whereby the mediating power takes an active part in the controversy and, by submitting proposals on its own initiative to the powers at variance, by acting for both in the exchange of proposals and otherwise, seeks to compose and adjust the differences between them. In the spring of 1915 the good offices of the United States were being exercised in the protection of the interests of enemy subjects in the several belligerent states of Europe. The action of the Pope in suggesting the exchange of disabled prisoners of war by certain of the belligerent powers was also the exercise of his good offices. The action of President Roosevelt in bringing the governments of Russia and Japan to participate in the Peace Conference of Portsmouth in 1905, as well as his coöperation in securing the adoption of proposals on one side and the other, was a good instance of mediation.

With the design of increasing the resort to mediation as a means of settling international differences and of making the process more effective, The Hague conferences of 1899 and 1907 sought to regularize the procedure and give it a defined status in international law by laying down certain rules for its use. The provisions adopted are as follows:

"In case of serious disagreement or dispute, before an appeal to arms, the contracting powers agree to have recourse, so far as circumstances allow, to the good offices or mediation of one or more friendly powers. . . . Independently of this recourse, the contracting powers deem it expedient and desirable that one or more powers, strangers to the dispute, should, on their own initiative and as far as circumstances may allow, offer their good offices or mediation to the states at variance. . . . Powers, strangers to the dispute, have the right to offer good offices or mediation, even during the course of hostilities.

"The exercise of this right can never be regarded by either of the parties at variance as an unfriendly act.

"The part of the mediator consists in reconciling the opposing claims and appeasing the feelings of resentment which may have arisen between the states at variance." (Convention for the Pacific Settlement of International Disputes (1907), Articles 2, 3, and 4.)

The mediation contemplated by these provisions has come to be known as "special mediation." In view of the failure of the efforts made by Sir Edward Grey, the British foreign secretary, and by other friendly powers to mediate between Austria-Hungary and Serbia, and thus to avert the War of the Nations in the summer of 1914, it may be doubted whether The Hague provisions have accomplished their purpose of making mediation a really effective means of adjusting serious differences between nations. See **INTERNATIONAL LAW**, and consult the authorities there referred to.

MEDIC, or **MEDICAGO**. See **HEDGEHOG PLANT**.

MEDICAGO. A genus of annual or perennial leguminous plants of wide distribution, some of the species of which are valuable forage plants, as alfalfa, medick, bur clover, and snail clover. There are about 50 species of medicago, most of which are native of Europe, Asia, and western Africa. There are about half a dozen species rather widely disseminated in the United States and since 1906 a number have been introduced from Russia and Siberia as forage plants for the northern Great Plains region. Among the species so introduced are *Medicago falcata*, *Medicago ruthenica*, *Medicago platycarpa*, and *Medicago media*. Some of these appear quite hardy and can grow with less rainfall than others and as a consequence are considered a valuable acquisition in the Dakotas and elsewhere. See MEDICK.

MEDICAL ASSOCIATION, AMERICAN. An association organized in 1847, and having in 1915 a membership of about 77,000, of whom 42,630 are fellows. Its annual sessions are held in the different large cities of the United States, but the headquarters are in Chicago, Ill., where the weekly *Journal* is published. The business body, the house of delegates, is composed of 150 members from the various State associations and from various branches of the Federal medical service. The object of the association is to promote the science and art of medicine. Its scientific work is conducted through 15 sections.

MEDICAL CODE. A collection of rules governing professional conduct, based upon medical history and tradition. The Code of Medical Ethics was adopted in due form by the American Medical Association in 1847, and was ratified by all the regular State and territorial medical associations of the United States. The medical departments of the army, navy, and public-health service of the United States are represented by delegates at the meetings of the national association. The articles of the code describe in detail the duties of physicians to their patients, the duties of physicians to each other and to the profession at large, the duties of physicians in regard to consultations and compensation, and the duties of the profession to the public. This code was in effect without change or amendment from 1847 to 1903—56 years. In 1882 the Medical Society of the State of New York refused to be governed by the medical code, especially the sections relating to consultations, and as a result its delegates were refused admittance to the meetings of the American Medical Association. To meet the situation thus created the New York State Medical Association was founded as the constituent State body of the national association. In 1902, at the annual meeting of the national body held at Saratoga, N. Y., the delegation of the New York State Medical Association introduced a complete revision of the Code of Medical Ethics which modified the objectionable features of the article on consultations. The revision was unanimously adopted at the meeting in New Orleans the following year. The revision called for a change from the Code of Medical Ethics with its regulations and penalties to the Principles of Medical Ethics, which are suggestive and advisory. The revision considers the American Medical Association as holding a relation to its constituent State and territorial medical associations analogous to that of the United States through its Constitution to the several States and Territories. Large dis-

cretionary powers are left to the respective State and territorial associations to form such rules governing the professional conduct of their members as they may consider proper, provided, however, that there shall be no infringement of the adopted ethical principles of the American Medical Association. The adoption of this revision resulted in the consolidation of the Medical Society of the State of New York and the New York State Medical Association under the name of the former and the plan of organization of the latter. The revision under its new title, the Principles of Medical Ethics, was submitted on May 10, 1906, by order of the supreme court of the State of New York to a referendum vote of the full membership of the consolidated society. By a vote of 3306 in the affirmative and 197 in the negative the Principles of Medical Ethics became binding on the Medical Society of the State of New York, and thus ended a division of the medical profession in the State of New York which continued 24 years—from 1882 to 1906. Consult Flint, *Medical Ethics and Etiquette* (New York, 1883), and *Principles of Medical Ethics*, issued by the American Medical Association (Chicago, 1912).

MEDICAL DEPARTMENT, UNITED STATES ARMY. The medical department is charged with the duty of investigating the sanitary condition of the army and making recommendations thereon; of advising with reference to the location of permanent camps and posts, the adoption of systems of water supply and purification, and the disposal of waste; with the duty of caring for the sick and wounded, making physical examinations of officers and enlisted men, the management and control of military hospitals, the recruitment, instruction, and control of the hospital corps and of the nurse corps (female), and furnishing all medical and hospital supplies except for public animals. In 1915 the authorized strength of the medical department, in time of peace, was 1 brigadier general, with the title of surgeon-general, 14 colonels, 24 lieutenant colonels, 105 majors, 205 captains, 254 first lieutenants (of whom 99 were first lieutenants of the medical reserve corps on active duty and 60 dental surgeons); total, 603 commissioned officers. The authorized enlisted strength (hospital corps) is 4012 men. Under an Act of Congress approved March 1, 1887, the enlisted men are not to be counted as a part of the strength of the army. In addition to the commissioned officers, civilian physicians and dentists may be employed as *contract surgeons* and *acting dental surgeons* under contracts entered into by or with the authority of the surgeon-general of the army. Of these there were 16 contract surgeons and 40 acting dental surgeons in 1915.

This department is also charged with the organization and training of the various units of the sanitary service required in the field in time of war. The functions of the sanitary service are as follows: (a) the institution of all practicable sanitary measures, to the end that the fighting forces suffer no depletion in strength due to avoidable causes; (b) the temporary care and professional treatment of the sick and wounded and their transportation to accessible points where they are transferred with as little delay as possible to the line of communications; (c) the supply of the necessary sanitary equipment. In addition, the sanitary service is charged with the preparation and preservation

of individual records of sickness and injury in order that claims may be adjudicated with justice to the government and the individual.

The *personnel* of the sanitary service in the zone of the advance may be classified into two general groups, as follows: first, that attached to organizations smaller than a brigade, which functions under the immediate orders of the organization commander and accompanies its unit into combat; second, that attached to the sanitary train, which functions under the orders of the division surgeon in accordance with such general or specific instructions as he may receive from the division commander. When necessary the sanitary *personnel* attached to organizations may be temporarily detached, in whole or part, and directed to operate with the sanitary train.

For the relief, care, and evacuation of the sick and wounded in battle the sanitary service provides, from front to rear, the following: (a) first-aid packets carried on the person; (b) regimental aid stations as near the firing line as possible; (c) dressing stations in the immediate rear of the regimental aid stations; (d) a station for the slightly wounded; (e) field hospitals, located 3 or 4 miles from the battle field, to which the wounded are carried by the ambulance companies; (f) evacuation hospitals still further to the rear. The services and equipment of the American National Red Cross Association are utilized under the immediate direction of medical officers. General hospitals, under the exclusive control of the surgeon-general of the army, are located as follows: Army and Navy General Hospital, Hot Springs, Ark.; General Hospital, Fort Bayard, N. Mex.; Letterman General Hospital, San Francisco; Walter Reed General Hospital, Washington, D. C.

The Army Medical School is located at Washington, D. C., and is organized under the supervision of a board of four or more instructors selected from officers of the medical department stationed in Washington and such assistant instructors as may be required. The senior officer, usually a colonel or lieutenant colonel, acts as commandant. Student officers are selected by the surgeon-general from medical officers, candidates for appointment, and militia officers. The course of instruction is for eight months and includes lectures and practical instruction in the duties of medical officers in war and peace; military medicine; microscopy, sanitary and clinical; military surgery, the care of the wounded in war, and hospital administration; pathology, histology, bacteriology, and urology; hospital-corps drill; first aid to wounded; X-ray work; equitation. Consult: *United States Army Regulations* (Washington, 1913) and *Field Service Regulations* (ib., 1914). See CONTRACT SURGEON; SURGEON, MILITARY; HOSPITAL CORPS; HOSPITAL, *Military Hospitals*.

MEDICAL DEPARTMENT, UNITED STATES NAVY. This comprises the Bureau of Medicine and Surgery of the Navy Department and the officers, men, and affairs under its cognizance, including all matters pertaining to the health and hygiene of the *personnel* of the navy, naval hospitals, hospital ships, etc. The chief of the bureau is selected from among the senior officers of the medical corps; he has the title of surgeon-general of the navy and the rank of rear admiral. At or near each important naval station there is a naval hospital in charge of a medical director, medical inspector, or surgeon. There is

also a hospital at the Naval Medical School (Washington, D. C.) and at Las Animas (Colo.). The chemical laboratory and naval-supply depot is at New York. The North Atlantic fleet is accompanied by a hospital ship commanded by a surgeon of the navy and in times of war there would be several such ships. On each vessel of the navy, except very small ones, there is at least one surgeon—on the larger ones two or three. The *personnel* of the medical department is made up of the medical corps, the medical reserve corps, the dental corps, the pharmacists, the nurse corps, and the enlisted men. In 1915 the medical corps consisted of 17 medical directors (rank of captain), 15 medical inspectors (rank of commander), 85 surgeons (rank of lieutenant commander), 154 passed assistant surgeons (rank of lieutenant), 41 assistant surgeons (rank of lieutenant, junior grade), 20 acting assistant surgeons (rank of lieutenant, junior grade), and 116 assistant surgeons (rank of lieutenant, junior grade) of the medical reserve corps. Candidates for the medical corps of the navy were formerly appointed directly to the medical corps from civil life. A candidate is now first given a preliminary examination for appointment as assistant surgeon in the medical reserve corps and, after taking the course at the naval medical school, comes up for final examination. Should he pass this he is appointed an assistant surgeon in the medical corps. A candidate for the position of assistant surgeon must be not less than 21 nor more than 30 years of age. The services of the medical reserve corps, which are entirely without pay, are rendered mainly in connection with recruiting stations and naval hospitals. A candidate for appointment in the reserve corps must be between 22 and 45 years of age and a citizen of the United States. He must be a graduate of a reputable medical school legally authorized to confer the degree of doctor of medicine and must have qualified to practice medicine in the State or Territory in which he resides. Appointment to this corps is made by the President upon the recommendation of the Secretary of the Navy after the candidate has passed the prescribed examinations. Permission to appear for examination must be obtained by application to the Bureau of Navigation through the surgeon-general. These examinations are conducted by officers of the medical corps of the navy.

The dental corps of the navy is under the cognizance of the Bureau of Medicine and Surgery. It consists of 1 dental surgeon, 28 acting assistant dental surgeons, and 11 assistant dental surgeons of the dental reserve corps; all have the rank of lieutenant, junior grade.

There are 14 chief pharmacists with the rank of ensign and 11 pharmacists with the rank of warrant officer. The nurse corps (female) is in charge of a superintendent. At each hospital there is a head nurse, or nurse in charge. Nurses serve only in hospitals and on hospital ships. On men-of-war the sick are nursed by hospital stewards and hospital apprentices. See UNITED STATES, *Navy*.

MEDICAL EDUCATION. The earliest institutions for the teaching of medicine were situated in temples and groves dedicated to the worship of the deities who were supposed to preside over the health of their worshippers. Thus, in Egypt the god Osiris and his wife Isis were the tutelary deities of the medical arts, and in Greece the god of health was Æsculapius.

The temples were situated in the neighborhood usually of streams and springs which were supposed to possess healing properties. One of the most famous of these ancient temples was that situated on the island of Cos; its most celebrated disciple was Hippocrates, who flourished early in the fourth century B.C. and whose teachings ruled medical science even to the close of the eighteenth century. Throughout Italy the same methods prevailed, the Romans deriving most of their medical lore from Greek teachers. Thus, Galen was a native of Pergamum, where there was a famous medical school in which he was educated. His great work as a teacher, however, was done in Rome. Greek teachers were also responsible for the rise of the Arabian school of medicine. In the sixth century A.D. the Nestorians, being driven out of Syria because of their heretical opinions, settled largely among the Arabs and transmitted to them their medical knowledge. By this time the teacher of medicine was practically divorced from his religious functions, although even down to the mediæval period much of the medical learning of the world appertained to the priesthood.

Until the time of the Renaissance the teaching of medicine in the mediæval medical schools consisted almost solely in dissertations and lectures upon the writings of Hippocrates and Galen. The dissection of the human body was only intermittently practiced. In 1315 Mondino dissected in Bologna the cadavers of two women. Master Albert, a lecturer in the same institution, dissected, in 1319, a body stolen from the cemetery by the students. Bertucci and Pietro de Angela, a little later, made systematic dissections. But, on the whole, anatomical science had made little advance.

Clinical teaching was on no better basis. The only way in which the student received bedside instruction was through apprenticing himself to some practitioner and accompanying him on his rounds, or by acting as his servant and assistant. Although the great universities conferred degrees in course, there were, nevertheless, enormous numbers of quacks and charlatans who flourished in the absence of any efficient laws regulating the right of persons to practice the healing art.

In the Middle Ages the most famous of all the medical schools was that of Salerno, near Naples, which was organized in connection with a monastery of Benedictine monks. Its graduates were to be found teaching in all quarters of the globe, and its influence was widespread, not only at the period in which it flourished, but for many years subsequent. Another celebrated medical school was that of Montpellier in France. The University of Paris was founded in 1205 and graduated very large classes. Its graduates were held in high esteem. They were not allowed to practice surgery, and held practitioners of that art in the greatest contempt. France, however, was the pioneer in recognizing the necessity for a higher education of surgeons and for their elevation to a rank corresponding to that of physicians. In surgical teaching the French were always greatly in advance of other nations. It was in the University of Paris, likewise, that midwifery was first taught to classes of male students.

Among the most famous centres for medical teaching in the sixteenth century were the schools of Bologna, Padua, and Pisa in Italy. At the present time Italian physicians are doing

a large amount of scientific research work. The facilities offered to students in their medical colleges, however, are not to be compared with those accorded by the other continental medical schools. In Germany there were numbers of universities with flourishing medical departments at a very early period, among which may be mentioned Erfurt, Wittenberg, and Vienna. With the nineteenth century a new era dawned in German medicine. To it more than to any other single nation is due the credit of the wonderful achievements of the present-day medicine. Virchow, Koch, and the other distinguished occupants of professorial chairs have had in their classes and laboratories eager students from all over the world. A more general education and a larger acquaintance with the various branches of the natural sciences are required of the German medical student than is customary elsewhere; a term of five years is requisite to obtain the degree of M.D.

In England the teaching of medicine was established upon a scientific basis chiefly by the efforts of Thomas Linacre, who founded chairs for the teaching of medicine in the universities of Oxford and Cambridge. As physician to Henry VIII he possessed an extensive influence at court, and this he wielded to great advantage, inducing the King to take the power of licensing persons to practice medicine out of the hands of the bishops, and rendering it necessary for the candidates to pass an examination and receive a degree from one of the other of the two universities. In England, as in France, it was many years before the education of the surgeon was considered as of equal importance with that of the physician. Until 1745 the surgeons were associated with the barbers in the corporation of the barber surgeons. In that year they separated, although it was not until more than 50 years later that the Royal College of Surgeons was incorporated.

The medical profession in England consists of three classes: first, physicians, who have received their degree from one of the universities; second, surgeons, who have graduated from one or another of the schools which exist in connection with the hospitals; and third, apothecaries, who dispense their own drugs and are generally considered as family physicians. Dispensers like American apothecaries are in England called chemists. The large hospitals in London have, in many instances, medical schools connected with them. Of the more prominent may be mentioned St. Thomas's, St. Bartholomew, St. George's, and Guy's. The course of instruction at these hospitals is three years; the teachers are the physicians and surgeons who serve the hospitals. After passing the examinations at his medical school, in order to obtain authority to practice the graduate is obliged to pass an examination before a board composed of representatives of some of the leading medical societies, such as the Royal College of Physicians, the Royal College of Surgeons, or the Society of Apothecaries, or of some of the faculty of one of the universities.

The medical schools of Scotland are of great antiquity. That of St. Andrews was founded in 1411, and the University of Edinburgh dates back to the year 1582, although it was many years subsequent to this before medical teaching there was placed on a scientific basis. The latter university exerted an incalculable influence on medical teaching in the United States,

owing to the large number of American students who attended its courses.

From a very early period in the history of North America public lectures on medical topics were given in various parts of the country. To Dr. Cadwallader Colden is ascribed the credit of the first attempt to establish a systematic course on medicine in the Colonies. He tried to have the Assembly in the Province of Pennsylvania pass an act imposing a tax upon every unmarried man for the purpose of supporting a "public physical lecture in Philadelphia." His efforts were fruitless. In 1730 Dr. Thomas Cadwallader lectured on anatomy in Philadelphia, and in 1752 Dr. William Hunter, a cousin of the great John Hunter, lectured on anatomy at Newport, R. I. Dr. Charles F. Wiessenthal, of Baltimore, delivered lectures on surgery in that city prior to the Revolution.

The first medical school in the United States was founded by Drs. John Morgan and William Shippen, Jr., in 1765, when they established a medical department of the College of Philadelphia, which institution subsequently became the University of Pennsylvania. This was shortly followed by the organization, in 1767, of the medical department of King's College, New York, the lineal ancestor of Columbia University. Harvard University established its medical department in 1782, and in 1898 a medical department was established by Dr. Nathan Smith at Dartmouth College. Previous to the foundation of medical schools the education of physicians in America had been entirely by means of the apprenticeship system, except when a young man possessed sufficient means to go abroad and study in the medical schools of Edinburgh, London, or the Continent. It has been estimated that at the outset of the War for Independence there were upward of 3500 practitioners in the Colonies, of whom not more than 400 had received medical degrees. Most of the early teachers in American medical schools had been educated at the University of Edinburgh. This led to a close perpetuation of the traditions of the medical school of Edinburgh in the United States. In the early part of the nineteenth century it became customary for American physicians desirous of studying abroad to take their postgraduate work in France. In this way the teaching of Laennec, Trousseau, and above all of the great Louis, became familiar to the American profession and served to give an immense impetus to scientific medical work in the United States. The most prominent medical colleges of the United States now require candidates for admission to possess a collegiate degree. In 1914 34 medical schools required as a minimum for entrance two or more years of work in a college of liberal arts in addition to a four-year high-school education; and five require, in addition to a four-year high-school course, one year of college work in physics, chemistry, biology, and a modern language. See MEDICAL STATISTICS.

In almost every State of the Union there are now examining boards which hold periodical examinations, which it is necessary for a physician to pass before he can establish himself in practice in the State. In 1875 there were no medical schools in the United States which required even so much as a three years' course. In 1914 a four years' course leading to the degree of doctor of medicine was the standard required for admission to membership in the Association of American Medical Colleges.

In the last 10 years there has been a marked reduction in the number both of medical colleges and of students. Colleges were decreased from 165 to 101. The number of students fell from 28,142 to 16,502, the number of graduates from 5747 to 3594. This was in response to a movement for reform inaugurated by the American Medical Association. Since the Civil War the number of colleges, many of them of low standing, had multiplied so rapidly that by 1906 there were more medical schools in the United States than in all other countries of the world combined. In response to a widespread demand for reform many of the small colleges were induced to dissolve and many others merged with stronger and better-equipped institutions. Finally the council on medical education created a standard classification of schools into grades denominated A, B, and C, according to the severity of their entrance requirements, length of course, and the quality of teaching and equipment. There was also a marked tendency for independent medical colleges to affiliate with universities and to establish closer relations with hospitals. Three colleges require a fifth year to be spent by the student as a hospital interne before conferring the degree of doctor of medicine. Twenty-eight States now have medical schools as integral parts of the State university. Twenty of these give a complete medical training and confer the degree of doctor of medicine and eight give only the first two years of the medical course. In 15 States no other medical schools exist, this branch of education being entirely in charge of the State university. A similar arrangement went into effect in Alabama in 1915.

Medical Education of Women. The proposition to admit women into the medical profession met with bitter opposition, which has gradually given way. Although the Boston Homœopathic School for Women was opened as early as 1848, the Association for the Advancement of the Medical Education of Women, organized some time afterward, first brought the subject clearly to public attention. The Woman's Medical College at Philadelphia was opened in 1850, and graduated 18 students in 1914. The Woman's Medical College of the New York Infirmary was opened in 1868 by Dr. Elizabeth Blackwell and her sister Emily (qq.v.), the Infirmary for Women and Children having been in successful operation since its establishment by Dr. Blackwell in 1853. The college was closed in June, 1898, having fulfilled its mission. There is a homœopathic institution in New York. In 1914 there were only two medical colleges exclusively for women students, the necessity for the existence of such institutions having declined with the practice of accepting students of both sexes by most medical colleges. In this year there were over 54 coeducational schools. Altogether there were 496 matriculants and 121 graduates.

Medical schools for women have been founded by American women in Turkey, and 15 graduates of the Woman's Medical College of Philadelphia in 1884 were especially prepared for missionary work in foreign lands. One of the first female practitioners in England was Dr. Elizabeth Blackwell, who settled in London in 1868 and became connected with the Woman's Medical College there. As late as 1867 the Apothecaries' Society passed resolutions excluding women from examinations for degrees. The admission of women to the University of Edinburgh led to

open riots among the students. The "enabling bill," giving permission to medical schools and societies to grant qualifications for the registration of physicians without regard to sex, was passed by Parliament in 1876; King's and Queen's College of Physicians, Dublin, and the London University threw open their doors to women soon afterward; and a preparatory medical school in London annually recruits the number of female matriculates in these institutions. There are dispensaries at London, Leeds, and Bristol superintended by female physicians; and Queen Victoria during her reign interested herself in behalf of medical missions carried on by Englishwomen in the East. The faculty of medicine at Paris has given a number of diplomas to women, as have the universities of Bern, Zurich, and Geneva. The first woman medical graduate in Germany was Mrs. Dorothea Christiana Erxleben, who received the medical degree from the University of Halle in 1754, upon recommendation by Frederick the Great in a royal decree. But medical colleges in Germany were closed to women till 1900, when by a decision of the German Federal Council female medical students were entitled to be admitted to the state examinations in medicine. Heidelberg University opened its doors to women in 1900. There are medical courses for women at the Carolinian institutions at Stockholm and at Upsala. The Spanish universities of Madrid, Valladolid, and Barcelona extend the same privileges. The War Department of the Russian government founded a medical school for women at St. Petersburg; a similar institution is now open at Moscow. All the medical societies in the United States and many in foreign countries admit female physicians to their congresses and discussions. For a complete presentation of medical education, consult "Medical Colleges of the United States" in the *Journal of the American Medical Association* (Chicago, 1914). See MEDICAL STATISTICS.

MEDICAL INSPECTION OF SCHOOLS. See SCHOOLS, MEDICAL INSPECTION OF.

MEDICAL JURISPRUDENCE, or FORENSIC MEDICINE. The application of medical science to the elucidation of legal questions which have a medical aspect. Although the principles of medical jurisprudence engaged the attention of the earliest lawmakers, Germany is given the credit of first providing by law for the examination of medical witnesses. This law was enacted in 1532 during the reign of Charles V and provided that in every case where death had been brought about by violence the opinion of physicians should be sought. It was not until the nineteenth century that forensic medicine developed any importance. In 1867 the Medico-Legal Society of the city and State of New York, the first of its kind, was organized. At the present time there are many such societies both in America and Europe. The questions included in modern medical jurisprudence are divided by Godkin into five general classes: (1) those arising out of sex relations, as impotence and sterility, pregnancy, legitimacy, and rape; (2) injuries inflicted on the living organism, as infanticide, wounds, poisons, injuries, and death from violence; (3) questions arising out of disqualifying diseases, as the different forms of mental alienation; (4) those arising out of deceptive practices, as feigned diseases; (5) ques-

tions of a miscellaneous nature, as age, identity, presumption of seniority, and life assurance. Writers on medical evidence hold that all testimony of a medical witness is expert evidence, but it admits of classification into (1) ocular evidence, which embraces such facts as may be observed in the ordinary attendance upon a patient, and (2) expert evidence, which includes evidence bearing on such cases as those in which a practitioner is required to give testimony based on a hypothetical statement propounded at a trial, or where he is called upon to testify as to the mental or physical condition of an individual examined by him for this special purpose.

In criminal trials in the United States each side hires its own experts, and, owing to the use of hypothetical questions and the advocate's eliciting only part of the truth, the spectacle is often presented of equally competent medical experts flatly contradicting each other. The effect which this has had in casting doubt upon the value of expert opinion, and the dissatisfaction to which it has given rise in the minds of judges, juries, and experts themselves, have led to numerous plans for remedying this defect in the present system of calling expert witnesses by establishing a class of official experts; but most of these plans conflict with one or all of the fundamental principles of the common law relating to the conduct of criminal trials: that the court shall be the sole judge of the law, that the jury shall pass upon facts, and that the defendant shall have the right to present any proper evidence on his own behalf.

In France experts are generally selected from a list of official specialists, termed *experts assermentés*, and if the parties cannot agree upon the experts, the court appoints them. The court may order an investigation and report by experts whenever necessary, and the order contains a statement as to the exact object of the investigation and appoints a referee or *juge commissaire*. Barristers, or *avocats*, do not appear before the experts; but the parties are represented by solicitors, or *avoués*, or sometimes by persons specially skilled in the matter under investigation. The report must be signed by all the experts (who are three in number), the reasons for any dissenting opinion being embodied in the report. The judges, however, are not bound by the report if it is contrary to their convictions.

In Germany official experts are scientifically trained in medicine, surgery, and obstetrics, and must pass an examination in their specialties of medical jurisprudence before the supreme board of the state. Every district has its expert governmental physician or surgeon. A medical college is selected in each province, to which appeal may be made when experts differ, and there is a final appellate court for the whole state to which further appeal may be made. Professional experts are paid by the government, are dependent upon neither side for compensation, and are given the preference in trials where their special knowledge is required; but the calling of outside experts is not thereby precluded. After the issues are determined upon which expert testimony is sought the parties may agree upon the experts and the court may appoint them. The court may limit the number of experts, or may submit to the parties the names of a number of experts, permit each side to challenge a certain number, and appoint those remaining.

The plan suggested by Sir James Stephen in his *History of the Criminal Law of England*, and used for some years in Leeds, has given much satisfaction. Under this plan, which requires a high standard of professional honor and knowledge, medical men refuse to testify unless before doing so they can meet in conference with the experts of the opposing side and have an exchange of views. As a result it is stated that at Leeds medical witnesses are rarely cross-examined, and often they are called on one side only.

MEDICAL SCHOOL. See MEDICAL EDUCATION.

MEDICAL SCHOOL, NETLEY. An establishment at Netley, near Southampton, England, for the technical education of medical officers for the British and Indian military service. Candidates are examined competitively in the ordinary subjects of professional knowledge, and, passing satisfactorily through that ordeal, are then required to attend for six months at the Military Medical School, where they go through practical courses of military hygiene, military and clinical-military surgery and medicine, and pathology with morbid anatomy. There is a training school for army nurses in connection with the hospital at Netley, where women enlist for life or during competency for work in army hospitals, in the field, or in foreign lands in care of the sick soldiery.

MEDICAL STATISTICS OF THE UNITED STATES. In the United States of America, including the Philippine Islands, Porto Rico, Hawaii, Alaska, and the Canal Zone, there were, in 1914, 138,443 physicians. The population of the United States alone was approximately 100,000,000. The United States has one physician to every 600 to 650 people, while the normal proportion of physicians to population in the leading nations of Europe is one to every 1500 to 2500 people. The figures given for the United States do not include the osteopaths, Christian Scientists, and other so-called drugless practitioners scarcely found in other countries. In 1914 there were 101 medical colleges and schools in the United States, with 16,502 students and 7411 instructors. Of the 101 schools 87 are regular or nonsectarian, 10 are homeopathic, 4 are eclectic; 54 are coeducational and 2 are colleges solely for women. There were also 17 postgraduate medical schools. The graduates in 1914 numbered 3320 nonsectarian, 154 homeopathic, and 70 eclectic, in all 3594. The status of medical colleges and schools in the United States is determined by the rating accorded them in the third classification of the Council on Medical Education of the American Medical Association. Statistics published in 1914 show a decrease during the last decade of about 35 per cent in the number of medical colleges and corresponding reductions in the number of students and graduates. See MEDICAL EDUCATION.

MEDICI, mā'dé-chē, THE. The most cele-

brated family of the Florentine Republic. The Medici owed their earliest distinction to the success with which they had pursued various branches of commerce and the liberal spirit in which they devoted their wealth to purposes of general utility. From the thirteenth century the Medici took part in all the leading events of the Republic. From the time when Salvstro de' Medici attained the rank of *gonfaloniere* in 1378 the family rose rapidly to preëminence, the foundation of its greatness being especially due to Giovanni, who died in 1429, leaving to his sons, Cosimo and Lorenzo, a heritage of wealth and honors hitherto unparalleled in the Republic. With Cosimo (1389-1464), on whom was gratefully bestowed the title of "Father of his Country," began the glorious epoch of the Medici; while from Lorenzo was descended the collateral branch of the family, which in the sixteenth century obtained absolute sway over Tuscany. Cosimo's life, except during a short period, when the Albizzi and other families reëstablished a successful opposition against the policy and credit of the Medici, was one uninterrupted course of prosperity. At once a munificent patron and a successful cultivator of art and literature, he did more than any sovereign in Europe to revive the study of the ancient classics and to foster a taste for mental culture. He assembled about him learned men of every nation and gave liberal support to numerous Greek scholars, and by his foundation of an academy for the study of the philosophy of Plato, and of a library of Greek, Latin, and Oriental manuscripts, he inaugurated a new era in modern learning and art. But, though he retained the forms of the Republic, and nominally confided the executive authority to a *gonfaloniere* and eight *priori*, or senators, he totally extinguished the freedom of Florence.

His grandson, LORENZO THE MAGNIFICENT (1449-92), became the virtual head of the Florentine state in 1469. In 1478 the conspiracy of the Pazzi nearly succeeded in overthrowing the Medici. Lorenzo's brother Giuliano was slain and he himself barely escaped. The result of the conspiracy was to give Lorenzo a firmer hold upon the state. He pursued with signal success the policy of his family, which was to win the favor of the lower classes and thereby make absolute their own power. He encouraged literature and the arts, employed learned men to collect choice books and antiquities for him from every part of the known world, established printing presses in his dominions, founded academies for the study of classical learning, and filled his gardens with collections of the remains of ancient art. When, however, his munificence and conciliatory manners had gained for him the affection of the higher and the devotion of the lower classes, he lost no time in breaking down the forms of constitutional independence that he and his predecessors had hitherto suffered to exist. Some few Florentines, alarmed at the progress of the voluptuous refinement, which was smothering every spark of personal independence, tried to stem the current of corruption by an ascetic severity of morals, which gained for them the name of *piagnoni*, or weepers. Foremost among them was the Dominican friar Girolamo Savonarola (q.v.), whose eloquent appeals to the people in favor of a popular and democratic form of government and a life of asceticism threatened for a time the overthrow of the Medici. Lorenzo achieved some reputa-

tion in belles-lettres. We have from him poems of many kinds, lyric, moral, dramatic, and descriptive. His *Canzoni* and *Sonetti* are love poems, to which he added a prose commentary. A true feeling for nature appears in the *Caccia del falcone*, and a rather pleasing picture of rural life is to be found in his *Nencia da Barberino*. A dramatic composition of a kind held in favor at the time is the *Rappresentazione di Santi Giovanni e Paolo* (performed in 1489). Like so many writers of the period, he cultivated the form of the *ballata* or dance song. He wrote also a number of *canti carnascialeschi*, or carnival songs. The religious spirit prevails in his *Laudi spirituali*. His love poetry is the best of all that he produced, and the most distinctive characteristic in it is the note of melancholy.

PIETRO (born in 1471), who succeeded his father Lorenzo in 1492, possessed neither capacity nor prudence; and in the troubles which the ambition of her princes and the undue use of the temporal power of the popes brought upon Italy, by plunging her into civil and foreign war, he showed himself treacherous and vacillating, alike to friends and foes. When Charles VIII of France, in 1494, marched into Italy in order to achieve the conquest of Naples, Pietro, in hopes of conciliating the powerful invader, hastened to meet the troops on their entrance into the dominions of Florence, and surrendered to Charles the fortresses of Leghorn and Pisa, which constituted the keys of the Republic. The magistrates and people, incensed at his perfidy, drove him from Florence and formally deposed the family of Medici from all participation in power. Pietro lost his life in the battle of the Garigliano in 1503 while fighting in the French ranks. In 1512 the Medici were reinstated in Florence, and the elevation of Giovanni de' Medici to the papal chair, under the title of Leo X (1513-21), completed the restoration of the family to their former splendor. The accession of Giulio de' Medici to the pontificate as Clement VII (1523-34), the marriage of Catharine, the granddaughter of Pietro, to Henry II of France in 1533, and the military power of the cadet branch (descended from a younger brother of the "Father of his Country") widened the rôle which the Medici were enabled to play.

Expelled from Florence in 1527, they were reinstated, and this time permanently, in 1530, by the combined forces of the Emperor Charles V and Pope Clement VII. The Florentines were forced to accept as their ruler a worthless prince, Alessandro de' Medici, a natural son of Lorenzo II (the father of Catharine), who was invested with the ducal dignity. On his death by assassination without direct heirs, in 1537, Cosimo I, the descendant of a collateral branch, was raised to the ducal chair. Cosimo, known as the Great, possessed the astuteness of character, the love of elegance, and taste for literature that had distinguished his great ancestors; but none of their frank and generous spirit. He founded the academies of painting and of fine arts, made collections of paintings and statuary, published magnificent editions of his own works and those of others, and encouraged trade, for the protection of which he instituted the ecclesiastical Order of St. Stephen. He was implacable in his enmity and did not scruple to extirpate utterly the race of the Strozzi (q.v.), the hereditary foes of his house. His acquisition of Siena gained for him in

1569 the title of Grand Duke of Tuscany from Pius V. He died in 1574, leaving enormous wealth and regal power to his descendants, who, throughout the next half century, maintained the literary and artistic fame of their family. In the seventeenth century the race rapidly degenerated, and after several of its representatives had suffered themselves to be made the tools of Spanish and Austrian ambition, the dynasty of the Medici became extinct with Giovanni Gastone, who died in 1737. In accordance with the stipulation of the Peace of Vienna, the Grand Duchy of Tuscany passed to the house of Lorraine. The name of the Medici family was kept alive by a house which pretended to have emanated from it in the thirteenth century, and which acquired the Principality of Ottajano towards the end of the sixteenth century. To this house belonged Luigi de' Medici (1760-1830), Duke of Sarto, known as the Chevalier de' Medici. He was a minister of Ferdinand I and Francis I of the Two Sicilies, and died while visiting Madrid in 1830.

MEDICI, TOMBS OF THE. The burial place of the Medici family in the new sacristy of the church of San Lorenzo at Florence. It contains Michelangelo's statues of Giuliano and Lorenzo de' Medici, the former represented as a general of the Church, the latter in deep meditation. The sarcophagus of Giuliano is adorned by the famous sculptures of Day and Night, and that of Lorenzo by those of Evening and Dawn. The work was left unfinished in 1534.

MEDICI, VILLA. See VILLA MEDICI.

MEDICINA, mǎ'dè-ché'nà. A town in the Province of Bologna, Italy, 15 miles east of the city of Bologna. It is situated in a low-lying region which is extensively cultivated. It has some manufactures, and trades in grain, wine, and mineral waters. Pop. (commune), 1901, 12,535; 1911, 13,632.

MEDICINAL (mê-dis'i-nal) **PLANTS.** Plants of which some part or product is used in medicine. Consult White, *Materia Medica* (London, 1914).

MED'ICINE (OF. *medicine*, Fr. *médecine*, from Lat. *medicina*, medicine, from *medicinus*, relating to a physician, from *medicus*, physician, from *medere*, Av. *mad*, to heal), **HISTORY OF.** While medical practice, in an elementary form, is probably as old as man, the oldest records of medical matters extant are those of Egypt. Most of our knowledge of Egyptian medicine is

derived from the Greeks, but recent discoveries of ancient papyri and better methods of deciphering inscriptions have yielded much original information. The Papyrus Ebers dates from about the sixteenth century B.C., and much of the learning therein recorded had been traditional for centuries. Certain facts concerning Egyptian medicine are well established. This art, as most others, was vested in the priests; there was an extensive formulary, combined with many ceremonial rites; practice was widely specialized—there were physicians, gynecologists, veterinarians, and military surgeons; but there was nothing like progress from one age to another. Egyptian medical lore was preserved in the last six volumes of the Sacred Book. These treated of anatomy, general diseases, instruments, remedies, diseases of the eye, and diseases of women, and in completeness and arrangement rival the Hippocratic collection, which they antedate by a thousand years.

The Hebrews derived their medical knowledge from Egypt, and are chiefly remarkable for their thorough conception of the value of public hygiene and sanitation, of which systems they may be considered the originators. In the early days of the existence of the Hebrew nation disease was looked upon as a punishment for sin, and the Levites were the sole practitioners. Later in their history the Jews received the impress of Assyrian, and later still of Greek, thought. After two captivities we find a class of temple physicians and special surgeons, and in the centuries immediately preceding the Christian era there were communal or city physicians who were held in high esteem. Jewish medical records embraced in the Talmud (q.v.) show the Jewish physicians had, like the Egyptian, little knowledge of human anatomy, that their surgery was crude, and that no operations in midwifery were performed.

The Vedas (q.v.), the sacred books of India, show that medicine as a separate science was in that country very ancient. The Indian physicians combined a close observation of pathological phenomena with a genius for misinterpretation, so that their study availed them little. Demonology played a large part in their practice and belief. Physicians were drawn from the highest caste (the Brahmins), and long training, decorum, and piety were required of them. Their therapeutic methods embraced diet, bathing, and innumerable drugs.

The origin of Chinese medicine is lost in tradition and fable. The Chinese attributed the invention of medicine to the Emperor Hwang-ti, who was supposed to have lived about 2687 B.C. They had elaborate rules for noting the pulse, and a portentous array of curious remedies, drawn from the animal, vegetable, and mineral kingdoms. They knew no anatomy, and their surgery was of a barbarous type. No bloody operations were performed, but cupping, acupuncture (q.v.), plasters, and fomentations were used. Medical practice was entirely unregulated. Chinese medicine remained practically unchanged until recent years, when the medical missionaries introduced modern methods.

It is Greece that furnishes us with the most interesting and significant remains of the history of medicine during antiquity. Chiron (q.v.), the Centaur, is fabled to have introduced the art of healing into Greece and to have been the preceptor of Æsculapius (q.v.), who was

as eminent among the Greeks as was Hermes in Egypt. Some scholars consider them identical. The followers of Æsculapius early formed a separate cult or worship. They had temples situated in groves and near springs, where healing was practiced and instruction given. Treatment consisted of the interpretation of dreams, propitiatory sacrifices, the offering of votive tablets, etc., but dieting, pure air, temperate living, and bathing also had their part in the cure, together with frictions, emetics, and purgatives. The system finally degenerated into mere mysticism, and by the time of Hippocrates only the superstitious resorted to it. Besides the temple medicine there were gymnasia, older even than Æsculapius, each of which had its *gymnasiarch* or director; a *gymnast*, under him, who directed the treatment of the sick; and *iatrioliptes*, who anointed, gave massage, bled, and dressed wounds and ulcers.

The period prior to the dispersion of the followers of Pythagoras (q.v.) (c.500 B.C.) is sometimes called the *sacred period* of medicine. It was followed by the *philosophical period*, inseparably linked with the name of Hippocrates (q.v.) (460–c.357 B.C.), the first great apostle of rational medicine. He classified diseases into epidemic, endemic, and sporadic; he wrote extensively on surgery (though ignorant of dissection), on obstetrics, hygiene, regimen, and on climatic influences; and his works display an immense range of knowledge and high powers of description.

From the time of Hippocrates, for several centuries, we find medical beliefs crystallizing about several schools or systems. The *Dogmatic*, or rationalistic, school of Hippocrates, founded by his sons, Thessalus and Draco, and his son-in-law, Polybius, based its principles of practice on theories derived from known facts and observations, and regarded maladies as units from their beginning to their termination; i.e., they recognized diseases as distinct entities. The *Empirics*, on the other hand, taught that remedies could only be suggested by experience. Their school was founded, according to Celsus, by Serapion, a pupil of Herophilus, mentioned later in this article. The *Methodists* occupied a position somewhere between the Empirics and Dogmatists, and the *Eclectics* chose, or pretended to choose, from each system what suited them, and adhered to none.

The philosophic period ended and the *anatomic period* began with the foundation of the Alexandrian Library, after the death of Alexander the Great, by Ptolemy, one of his lieutenants. This was in 320 B.C., and the centre of medical thought and teaching was now shifted to Alexandria. Here the Ptolemies gathered about them the learned men of the day. Although Egyptian prejudice was strong against it, Ptolemy encouraged dissection of the human body. Among the famous teachers of Alexandria were Herophilus and Erasistratus (q.v.). The former is supposed to have been the first to dissect a human body, and between them they made many notable discoveries, concerning the structure of the brain, eye, heart, and intestinal canal. Erasistratus died about 280 B.C. During this period medical thought was practically divided into two schools, the Dogmatist and Empiric.

The first native Roman writer on medicine was Celsus (q.v.), born at about the time of Christ. His work, *De Medicina*, gives a sketch of the history of medicine up to his time and

the state in which it then existed. He followed the teachings of Hippocrates and exercised a dominant influence until Galen (q.v.) (130-c.201) totally supplanted him. Galen wrote over 100 works, some of them on anatomy. He described every bone in the human body, and the functions of the muscles; he recognized two kinds of nerves—those of sensation, which he thought came from the brain, and those of motion, which he believed to originate in the spinal marrow. He divided the body into the cranial, thoracic, and abdominal cavities, whose proper envelopes he described. Galen strove to popularize the study of anatomy, with but little success, and with his death came the end of the anatomical period and the end for several centuries of medical progress.

The first names of any renown that occur after the death of Galen are those of Oribasius, Alexander of Tralles, Aëtius, and Paulus Aegineta, who flourished between the fourth and seventh centuries. They were all zealous Galenists. With the death of Paulus the Greek school may be said to have ended, for after his time no works of merit were written in this language.

Arabian medicine was an offspring of the Greek, through the Nestorian monks, who settled in Persia and Arabia in the sixth century and established many schools of learning. Fragments of the sect still remain in these countries. By the seventh century Arabian physicians were in high repute. The earliest Arabic writer on medicine was Ahum, who was contemporary with Paulus; but the most celebrated physicians of this school were Rhazes, who lived in the ninth century and was the first to describe smallpox; Avicenna (q.v.), of the eleventh century, whose *Canon Medicinæ* embraced all that was then known of medicine and the collateral sciences; Albucasis, whose works on surgery were the standard for several centuries; Avenzoar; and Averroës, who lived in the twelfth century and was equally celebrated as a physician and a philosopher. The works of Hippocrates and Galen, which, together with those of Aristotle, Plato, and Euclid, were translated into Arabic in the ninth century, formed the basis of their medical knowledge; but the Arabian physicians did good service to medicine by introducing new articles from the East into the European *materia medica*, e.g., rhubarb, cassia, senna, and camphor, and in making known the first elements of pharmaceutical chemistry, such as distillation and the methods of obtaining various metallic oxides and salts. During this period that part of Europe not in the hands of the Saracens was subjected to successive invasions of northern barbarians, and medicine, as other arts, was at a standstill. There was a brief period of quiet during the reign of Charlemagne, when medical practice seems to have again passed into ecclesiastical control, and from the ninth until the thirteenth century the Jews (who acquired their learning from the Saracens) shared with the clergy the art of healing.

Upon the decline of the Saracenic universities of Spain, which may be dated from the death of Averroës, the best medical teaching was to be found in Italy, where the school of Salerno became celebrated. It was gradually eclipsed in its turn by the rising fame of other medical schools at Bologna, Vienna, Paris, Padua, and elsewhere. Contemporary with Mondino lived Gilbert, the first English medical writer of note;

and the prior century gave birth of Linaère (q.v.), who studied at the continental universities and subsequently founded the London College of Physicians. It was in the fifteenth century that the sect of chemical physicians arose, who maintained that all the phenomena of the living body may be explained by the same chemical laws as those which rule inorganic matter. The chemical school, with Paracelsus (q.v.) at their head, did nothing to advance medicine except to introduce into the *materia medica* several valuable metallic preparations. During this period many new diseases were recognized and described.

In the sixteenth century the study of human anatomy was first fairly established by the labors of Vesalius (q.v.), and in this century and the following we meet with the names of many physicians whose anatomical and physiological studies materially advanced medical science. This was the epoch of Eustachio (q.v.), Fallopio (q.v.), Assellius, Harvey (q.v.), Rudbeck, Bartholin, Glisson, Sylvius, Willis, Bellini, and others. Ambroise Paré (1517-90) made important additions to surgical knowledge and technique. The Cæsarian operation, which had been known among the Greeks and Romans, was revived. Malpighi (q.v.) and Grew founded the cell doctrine. Besides many discoveries in minute anatomy, made possible by the invention and gradual improvement of the microscope, the *materia medica* was enriched by the addition of Peruvian bark, or cinchona, by the Countess Chinchon in 1632. The seventeenth century is also marked by great advance in obstetrics; medical jurisprudence had its beginning about this time; and bedside or clinical teaching was introduced. Chemistry was now becoming distinct from alchemy and advancing to the dignity of a science, and an alliance between its principles and those of physiology was formed, which resulted in a new sect of chemical physicians, quite distinct, however, from the sect represented two centuries previously by Paracelsus. These chemical physicians believed that diseases were referable to certain fermentations which took place in the blood, and that certain of these *humors* were naturally acid and others alkaline, and that when one or the other of these predominated certain specific diseases were the result, which were to be removed by the exhibition of remedies of a nature opposite to that of the disease. They were soon succeeded by the Iatromathematical school, of which Borelli, Sauvages, Kneill, Jurin, Mead, and Friend were among the best known. Another sect was that of the Vitalists, which originated with Van Helmont, and which, with some modification, was adopted by Stahl and Hoffmann. Among other physicians whose names stand out prominently in the annals of the seventeenth century are Sir Thomas Browne and Sydenham (q.v.), both Englishmen, the latter the greatest clinical physician of his time; Wharton, who discovered the submaxillary duct; Schneider, who described the Schneiderian mucous membrane of the nose; Stenson, Peyer, Brunner, Pacchioni, Havers, and Cowper.

The most eminent teacher of medicine in the early part of the eighteenth century was Boerhaave (q.v.), elected to the chair of medicine at Leyden in 1709. Among the pupils of Boerhaave was Van Swieten, whose comments on the aphorisms of his master formed a valuable collection of practical observations; and Haller (q.v.),

who has been called the father of modern physiology and who first enunciated the theory that irritability and sensibility are specific properties of muscular and nervous tissues. Most of the distinguished physicians of the latter part of the eighteenth century belonged to the Cullenian school of medicine. (See CULLEN.) Cullen's views were attacked with great acrimony by his former assistant, John Brown (q.v.), who became the founder of the Brunonian system of medicine. In Great Britain the views of Brown were regarded as too purely theoretical and did not attain any great popularity; but in some parts of the Continent, and especially in Italy, they found acceptance and became for a considerable time the prevailing doctrine in the leading medical schools. Among the medical curiosities of the later years of this century were the doctrine of animal magnetism, or mesmerism (q.v.), and homeopathy (q.v.). The latter was founded by Hahnemann (q.v.) and served a useful purpose in protesting against the enormous dosage of medicines and the excessive bloodletting then in vogue. The eighteenth century witnessed a steady progress in all branches of medicine and surgery, the social status of the practitioner was raised, and medicine became a conscientious vocation and not a mere trade. The greatest single discovery of the age, and that which conferred the most benefit on mankind, was vaccination (see JENNER), and next to this, perhaps, a reform in the methods of treating the insane. To supplement this outline of the progress of medicine in the eighteenth century, the reader is recommended to consult the biographical sketches of Monro, the Hunters, and others.

The nineteenth century was one of epoch-making discoveries, only a few of which can even be mentioned within the limits of this article. In the early years of the century Laennec (q.v.) invented the stethoscope and thereby instituted a complete revolution in the methods of physical diagnosis; Virchow (q.v.) founded modern cellular pathology; Pasteur (q.v.), by his studies in fermentation and putrefaction, prepared the way for the germ theory of disease; and Lister (q.v.), stimulated by Pasteur's discoveries, gave to surgery the antiseptic treatment of wounds. Laveran (q.v.) in 1880 discovered the plasmodium of malaria (q.v.), and Koch (q.v.) in 1882 the bacillus of tuberculosis. Since then it has been proved that anthrax, Asiatic cholera, and most of what are called the specific infectious diseases, are due to minute vegetable or animal organisms. (See BACTERIA.) The discovery of general anesthetics was no less important and remarkable. Morton (q.v.), of Boston, demonstrated the anæsthetic properties of sulphuric ether in 1846; and Simpson, of Edinburgh, introduced chloroform in 1847. The introduction of cocaine as a local anæsthetic in 1884 by Koller made possible the performance of painless operations on the eye and in the nose and throat and other parts of the body. The *ateria medica* has been enriched by the addition of quinine, morphia, strychnine, iodine and the iodides, the bromides, hydrocyanic acid, and cod-liver oil, and, more interesting than these, of antitoxic serums. (See ANTITOXIN; SERUM THERAPY.) Diphtheria antitoxin especially has saved thousands of lives. Among the more important instruments invented during the nineteenth century are the ophthalmoscope and the laryngoscope.

The early years of the twentieth century may be looked upon as the beginning of a new era, that of organized preventive medicine. Nearly all efforts have been in the direction of prophylaxis and control of disease. Tropical medicine in particular has been the subject of intense and organized study in Africa, America, and the East. Hookworm disease was brought under control in Porto Rico (1903-04) by Ashford, an American army surgeon, and in the southern United States by Stiles (1910-12), who named the American species *Necator americanus* (1912). In 1910 Loos demonstrated that the hookworm larvæ penetrate the skin. To the studies of Reed, Carroll, and Lazear must be credited the control of yellow fever. These observers proved the transmission of the virus of the disease by a mosquito, *Stegomyia*, and thereby enabled Gorgas to clear Havana of yellow fever in three months and afterward to accomplish the brilliant feat of sanitation which made possible the building of the Panama Canal. The control of tropical dysentery, sleeping sickness, beriberi, and other fatal tropical diseases has been measurably successful and life for the white man in the tropics has been rendered comparatively safe. Through the labors of Metchnikoff, Wright, and others the defensive properties of the blood and the subject of immunity in general have been enormously advanced and have resulted in the production of a new system of treatment of bacterial infection, viz., vaccinotherapy. Among the many new drugs discovered the most important is salvarsan (q.v.), a specific for syphilis introduced by Ehrlich in 1909. Schaudinn discovered the parasite in 1905, Wassermann the serodiagnosis in 1907, and Noguchi the luetin test for the disease in 1901. In 1913 Noguchi demonstrated the spirochetes in the tissue of the nervous system and thus cleared up many speculations as to the relation of syphilis to certain nervous diseases. These discoveries with respect to syphilis have put the diagnosis and treatment of this malady and its allied affections on an entirely new basis. The Roentgen rays (X rays) have found increasing employment both in treatment and diagnosis. Lastly this period has been marked by investigations of the internal secretions and the functions of ductless glands, which have been of valuable help in the elucidation of obscure diseased conditions. Other advances in contemporary medicine will be dealt with more fully under their own titles. Surgical developments, which have been great, will be noticed in full under the title SURGERY. For a complete review of medical progress year by year, consult the NEW INTERNATIONAL YEAR BOOK. See HYGIENE.

Payne, *English Medicine in Anglo Saxon Times* (Oxford, 1904); Roswell Park, *Epitome of the History of Medicine* (2d ed., Philadelphia, 1906); D. A. Gorton, *History of Medicine, Philosophical and Critical, from its Origin to the Twentieth Century* (2 vols., New York, 1910); Munier, *Histoire de la médecine* (Paris, 1911); Garrison, *History of Medicine* (Philadelphia, 1913).

MEDICINE, AMERICAN ACADEMY OF. An association organized in 1876 and incorporated in 1913, holding annual meetings in different large cities of the United States. It was organized to conduct an active propaganda for

the proper education of physicians and gradually developed into a society studying the questions of social medicine. It has a membership of nearly 700 and its publication is the *Journal of Sociologic Medicine*, appearing in Easton, Pa.

MEDICINE, FORENSIC. See MEDICAL JURISPRUDENCE.

MEDICINE, NEW OR ECLECTIC SCHOOL OF. See ECLECTIC SCHOOL OF MEDICINE.

MEDICINE, VETERINARY. See VETERINARY MEDICINE.

MEDICINE DANCE. A name sometimes applied to the sun dance of the Cheyenne and other Plains Indians. The same ceremony among the Blackfoot Indians is spoken of as the medicine lodge. See SUN DANCE; CHEYENNE.

MEDICINE HAT. A city and the capital of the electoral division of Medicine Hat, Alberta, Canada, situated on the South Saskatchewan River and on the main line of the Canadian Pacific Railway, about 165 miles east-southeast (direct) of Calgary and about 600 miles west (direct) of Winnipeg (Map: Alberta, K 8). Its public buildings and institutions include the Dominion Lands Office, a general hospital, a business college, and the exhibition buildings and grounds. There are two parks and a dry-farming demonstration farm. Among manufacturing industries and establishments are a grain elevator, flour, linseed-oil, rolling and planing mills, brick plants, a steel plant, and manufactories of cement, graphite and crayon products, lumber, glass, clay products, and foundry and machine-shop products. Clay and coal are found in the surrounding district. The city owns its electric-lighting and gravitation water systems and eight natural-gas wells, which supply power for manufacturing. Pop., 1901, 1570; 1911, 5608.

MEDICINE MAN. A name used for a shaman among the American Indians. The term "medicine" in the same connection has no reference to the treatment of disease, but to supernatural relations between persons and objects, or between persons and higher powers. A true medicine man is in reality a priest rather than a doctor, though he may exercise both functions, since most medical practice among the Indians is based upon magic rather than upon therapy. See INDIANS.

MED'ICK (OF. *medique*, from Lat. *medica*, from Gk. *μηδική*, *mēdikē*, median grass, from *Μηδικός*, *Mēdikos*, median, from *Μῆδος*, *Mēdos*, OPers. *Māda*, *Mede*), *Medicago*. A genus of plants, natives of temperate and warm climates of the Old World, of the family Leguminosæ, distinguished from the closely related genus *Trifolium* (clover) by the sickle-shaped or spirally twisted pods. The species, which are very numerous, are mostly annual and perennial herbs with leaves of three leaflets like those of clover. A number of them are found in Europe, and have also been introduced into the United States. The most important species is the purple medick, lucerne, or alfalfa (q.v.); other important species are bur clover (*Medicago denticulata*), distributed in California and the grazing regions of the South and Southwest; yellow lucerne (*Medicago falcata*), which grows wild in northern Europe; black medick (*Medicago lupulina*), widely grown as a pasture plant; and spotted medick (*Medicago maculata*), introduced into the Eastern and Southern States. They are generally valuable as forage and pasture plants. Consult *Texas Agricultural Ex-*

periment Station, Bulletin 108 (College Station, Brazas Co., 1908), and *Alabama Agricultural Experiment Station, Bulletin 165* (Opelika, 1912).

MÉDICO DE SU HONRA, mā'dē-kō dā sōō ōn'rā, EL (Sp., The Physician of his own Honor). One of the strongest dramas of Calderón.

MEDICO-PSYCHOLOGICAL ASSOCIATION OF GREAT BRITAIN AND IRELAND, THE. An association founded in 1841, with headquarters in London, England, and incorporated in 1895. Its objects are the study and promotion of mental pathology and the improvement of the treatment of the insane. The membership, which is over 600, is made up of registered medical practitioners and of honorary corresponding members. The regular publication of the association is the *Journal of Mental Science*. The association is subdivided into five divisions, which also hold divisional meetings. Meetings are held on the third Thursday in February at some city in Britain other than London, and in the latter city on the third Tuesday in May and November. The president in 1914 was D. G. Thomson, M.D., and the honorary secretary M. A. Collins, M.D.

MEDILL', JOSEPH (1823-99). An American journalist. He was born in New Brunswick, Canada, but at the age of eight removed with his parents to Stark Co., Ohio, afterward studied law and practiced his profession at Massillon. In 1849 he entered journalism and took charge of the Coshocton *Republican*, a Free Soil paper. Two years later he established the Cleveland *Forest City*, a Whig organ, but in 1852 united it with the *Free Democrat*, the new paper being called the *Leader*. A little after he left the Whig party and in 1854 was an organizer of the Republican party in Ohio. In 1856, with two partners, he bought the Chicago *Tribune*. In 1870 he helped frame a new State constitution for Illinois, in 1871 was appointed a member of the first Civil Service Commission, and in 1872 was elected mayor of Chicago. He spent a year in Europe (1873-74) and on his return became chief proprietor and editor in chief of the *Tribune*, and he continued in that position until his death. He was instrumental in establishing the Chicago Public Library and in securing the Columbian Exposition for Chicago.

MEDI'NA (Ar. *al Medinah*, the city; or more fully *Medinat al Nabi*, the city of the Prophet; called also *Tayyibah*, the perfumed, or *al Munawwarah*, the illumined; before the time of Mohammed known as *Yathrib*, whence it is mentioned by Ptolemy as *Jathrippa*). One of the sacred cities of Islam, the scene of Mohammed's labors after his emigration from Mecca (see MOHAMMED; HEJIRA), and the place of his tomb (Map: Turkey in Asia, D 6). It is about 250 miles north of Mecca and 140 north by east of the port of Yambu. The population was estimated by Burton at the time of his visit (1852) at 16,000; a later estimate places it at 50,000. In the third century A.D. the tribes of *Aus* and *Khazraj* emigrated to Yathrib from Yemen. It was by representatives of these tribes that Mohammed was invited to Medina; with them he entered into an alliance, and they were his "helpers" (*ansar*) after he had taken up his residence in Medina (622 A.D.), though among the members of both tribes there were many who hesitated, vacillated, and occasionally took sides with the opponents of the Prophet, the so-called *Munafikuna*. There was also a large Jewish

population in Medina, the leading tribes being the Kainuka and the Nadhir, who were driven out after the battle of Ohod (625), and the Kuraiza, who were slaughtered by the Moslems later. Medina remained the residence of Mohammed even after the capture of Mecca in 630, and he died there in 632. It was the capital of Abu Bekr (630-632), Omar (632-644) and Othman (644-656), until Ali removed the seat of government to Kufa (656-661) and Moawiyah made Damascus the capital of the Ommiad dynasty. It consists of three principal parts—a town, a fort, and suburbs of about the same extent as the town itself, from which they are separated by a wide space. Medina forms an irregular oval within a walled inclosure, 35 to 40 feet in height, and flanked by 30 towers—a fortification which renders the city the chief stronghold of Hejaz. Two of its four gates, viz., the *Bab al Jum'ah* (Assembly Gate, in the eastern wall) and the *Bab al Misri* (Egyptian Gate), are massive buildings with double towers. The streets, between 50 and 60 in number, are narrow and paved in only a few places. The houses are flat-roofed and double-storied and are built of a basaltic scoria, burned brick, and palm wood. Very few public buildings of any importance are to be noticed except the mosque, erected near the spot where Mohammed died. It is of smaller dimensions than that of Mecca, being a parallelogram, 420 feet long and 340 feet broad, with a spacious central area called *al Şahn*, which is surrounded by a peristyle with numerous rows of pillars. The Mausoleum, or *Hujrah*, itself behind the mosque proper, is an irregular square, 50 to 55 feet in extent, situated in the southeast corner of the building and separated from the walls of the mosque by a passage about 26 feet broad. A large gilt crescent above the "green dome" springing from a series of globes surmounts the *Hujrah*, a glimpse into which is attainable only through a little opening, called the Prophet's window; but nothing more is visible to the profane eye than costly carpets or hangings, with three inscriptions in large gold letters stating that behind them lie the bodies of the Prophet of Allah and the two caliphs (Abu Bekr and Omar) and an empty tomb for Jesus. These curtains, changed whenever worn out or when a new Sultan ascends the throne, are supposed to cover a square edifice of black marble, in the midst of which stands Mohammed's tomb. Its exact place is indicated by a long, pearly rosary (*Kaukab al Durri*) suspended from the curtain. The Prophet's body is supposed to lie (undecayed) stretched at full length on the right side with the right palm supporting the right cheek, the face directed towards Mecca. Outside the drapery is the tomb of Fatima, the daughter of Mohammed. Close behind him is placed, in the same position, Abu Bekr, and behind the latter, Omar. The fact, however, is that when the mosque, which had been struck by lightning, was rebuilt in 892, three deep graves were found in the interior, filled only with rubbish. Many other reasons make it more than problematic whether the particular spot at Medina really contains the Prophet's remains. Of the fabulous treasures which this sanctuary once contained little now remains. As in Mecca, a great number of ecclesiastical officials are attached in some capacity or other to the mosque, as ulemas, imams, khatibs, etc.; and not only they, but the townspeople in general, live to a great ex-

tent on the pilgrims' alms, the city having little trade. The mosque was destroyed by fire in 1257 and was rebuilt 1258-88; it was restored in 1487 by Khaid Bey of Egypt. It is one of the very few mosques with three minarets. From 929 to 950 the Karmathians (see MOHAMMEDAN SECTS) were masters of the city. Medina recognized the authority of Selim I in 1517. It fell into the power of Saud, the Wahabi general, in 1803, and was reconquered by Tussun Pasha in 1815. There are few other noteworthy spots to be mentioned in Medina, save the minor mosques of Abu Bekr, Ali, Omar, etc. The private houses, however, surrounded by gardens, fountains, etc., have a very pleasing appearance, and the city, although in its decay, is yet busy and agreeable. A number of madrasahs, or endowed schools, represent what learning there is left in Medina, once famed for its scholars. As is the case with Mecca, non-Mohammedans are rigorously excluded from the sacred city, yet it has been visited by Varthema (1503), Wild (1604), Pitts. (c.1685), Seetzen (1806), Burckhardt (1814), Wallin (1845), Burton (1854), Keane (1878), and Wavell (1912).

Bibliography. Burckhardt, *Travels in Arabia* (London, 1829); Burton, *Journal of a Pilgrimage to el-Medinah and Mecca* (ib., 1855); Wellhausen, "Medinah vor dem Islam," in his *Skizzen*, iv (Berlin, 1889); Soubhy, *Pèlerinage à la Mecque et à Médine* (Cairo, 1894); Hogarth, *The Penetration of Arabia* (London, 1905); Leszynsky, *Die Juden in Arabien* (Berlin, 1910); Wavell, *A Modern Pilgrim in Mecca* (London, 1912); Bevan, "Mohammed and Islam," in *The Cambridge Medieval History*, vol. ii (Cambridge, 1913); Caetani, *Studi di storia orientale*, vol. i (Milan, 1911), vol. iii (ib., 1914); Lammens, *Le berceau de l'Islam* (Rome, 1914).

MEDINA. A village in Orleans Co., N. Y., 41 miles west of Rochester and equally distant to the northeast from Buffalo, on Oak Orchard Creek, the Erie Canal, and the New York Central and Hudson River Railroad (Map: New York, B 4). It is in a fertile agricultural region and derives good water power from the creek, where a storage dam has been constructed. There are valuable sandstone quarries, foundries, iron works, pump works, flouring mills, and manufactories of furniture, shirts, vinegar, cigars, and extracts. Medina Falls are noted for their scenic beauty. Settled about 1830, Medina was incorporated in 1832. The present government is administered under a charter of 1874, which, as subsequently amended, provides for a president, annually elected, and a board of trustees who act with the executive in electing subordinate officials. Medina owns its water works. Pop., 1900, 4716; 1910, 5683.

MEDINA. A village and the county seat of Medina Co., Ohio, 32 miles southwest of Cleveland, on the Baltimore and Ohio and the Northern Ohio railroads (Map: Ohio, G 3). It contains the Pythian Sisters' Home, Sylvester Library, and the beautiful Spring Grove cemetery. The chief industrial establishments are bee-supply works, foundries, and bending works. The surrounding country is adapted to farming. Pop., 1900, 2232; 1910, 2734.

MEDINA. The sister of Elissa and Perissa, in Spenser's *Faerie Queene*. She represents the golden mean.

MEDINA, mǎ-dé'ná, JOSÉ TORIBIO (1852-). A Chilean bibliographer and historian,

born in Santiago de Chile. He was educated at the National Institute and the University of Santiago, receiving the law degree in 1873. In 1874 he was appointed secretary to the Chilean Legation at Lima, where he made investigations in the archives during his spare time. Thence he traveled in the United States and Europe, visiting libraries and archives. Returning to Chile in 1878, he served in the Chilean-Peruvian War and at its close was appointed judge in the newly acquired territory. In 1884 he was made secretary to the Chilean Legation at Madrid and was commissioned by the government to make investigations in the Spanish archives respecting the history of Chile. After several years' study in Spain, he returned to Chile, but in 1902 he made a third voyage to the United States and Europe to continue his studies. He spent his life in investigation, writing, editing, and publishing, having set up a printing plant in his own house. His first literary effort was a translation of Longfellow's *Evangeline* (1874). His fame, however, rests upon his indefatigable investigations in history and bibliography, in which he spent more than 35 years. He ranks as one of America's greatest bibliographers. His principal work, the *Biblioteca hispano-americana, 1493-1810* (7 vols., 1898-1907), is remarkably erudite and valuable, containing the description of about 10,000 books. Other works of the same character are *Historia y bibliografía de la imprenta en el antiguo virreinato del río de la Plata* (1892), *La imprenta en Manila desde sus orígenes hasta 1810* (1896), *Biblioteca hispano-americana septentrional* (1897), *Biblioteca hispano-chilena, 1523-1817* (3 vols., 1897-99), *La imprenta en Bogotá, 1739-1821* (1904), *La imprenta en Guadalupe de México, 1793-1821* (1904), *La imprenta en Guatemala, 1660-1821* (1910), *La imprenta en la Habana, 1707-1810* (1904), *La imprenta en Lima, 1584-1824* (4 vols., 1904-07), *La imprenta en México* (1907 et seq.), *La imprenta en Puebla de los Angeles, 1640-1821* (1908), and many similar works covering books published in various cities of Spanish America. His historical works, all based upon manuscript sources, include *Historia de la Inquisición en Lima* (1887), *El Tribunal del Santo Oficio de la Inquisición en Chile* (2 vols., 1890), *Juan Díaz de Solís* (2 vols., 1897), *La Inquisición en las Islas Filipinas* (1899), *La Inquisición en México* (1905), *El Portugués Estebán Gomez* (1908), *El veneciano Sebastian Caboto* (2 vols., 1908). He also published *Medallas coloniales hispano-americanas* (1900), *La instrucción pública en Chile* (2 vols., 1905), *Diccionario biografico colonial de Chile* (1906), and many other works, and edited 30 volumes of the *Colección de documentos ineditos para la historia de Chile*. Consult V. M. Chiappa, *Noticias acerca de la vida y obras de Don José Toribio Medina* (Santiago, 1907).

MEDINA DE RIO SECO, dā rē'ō sā'kō. A small town of Spain, in the Province of Valladolid, 20 miles northwest of the city of that name (Map: Spain, C 2). Here, on July 14, 1808, a Spanish army of 50,000 was defeated by 12,000 French. Pop., 1910, 4949.

MEDINA SERIES. A subdivision of the Silurian system, of which it forms the basal part, or else is preceded only by the Oneida conglomerate. The rocks are conglomerates, sandstones, and shales. They are abundant in the eastern United States, and attain a thickness of over 1000 feet in New York and Pennsylv-

vania. At Medina and other places in western New York large quarries of building stone occur in the formation. See GEOLOGY; SANDSTONE.

MEDINA SIDONIA, mā-dē'nā sē-dō'nyā. A town of south Spain, in the Province of Cadiz, situated on a steep eminence, 20 miles southeast of Cadiz (Map: Spain, C 4). It has a picturesque appearance, contains a beautiful Gothic church and the ruins of the ancestral palace of the dukes of Medina Sidonia. Pop., 1900, 11,003; 1910, 11,602. The dukes of Medina Sidonia played an important part in the internal political life of Spain, and to one of them was intrusted the command of the Armada for the invasion of England in 1588. See ARMADA.

MEDINA SIDONIA, DON ALONSO PEREZ DE GUZMAN, seventh DUKE OF (1550-1615). A Spanish admiral who is safe from deserved oblivion because he commanded the ill-fated Armada, which was defeated by the English in 1588. In his time he was the highest (and richest) nobleman in Spain, and although he lacked ability, naval training, and stomach for the sea, Philip II placed him in supreme command of his "invincible" fleet, because his rank would insure the obedience of the officers under him. Philip did not regard the confessed incompetence of the Duke as a serious obstacle to the success of the expedition, for he had very detailed instructions and also a technical adviser. The charge of personal cowardice is probably unmerited. On his return to Spain with the remnants of the Armada he had not the good fortune to sink into obscurity. He was "captain general of the ocean sea" and commander of the Spanish forces which failed to prevent the sack of Cadiz in 1596, and he bears responsibility for the defeat of a Spanish squadron off Gibraltar in 1606. Consult: *Documentos relativos á Don Alonso de Guzman el Bueno, séptimo duque de Medinasidonia* (Madrid, 1856), being volume xxviii of the *Colección de documentos inéditos para la historia de España*; C. Fernández Duro, *La Armada Invencible* (2 vols., ib., 1884-85); J. K. Laughton (ed.), *State Papers Relating to the Defeat of the Spanish Armada, Anno 1588* (2 vols., London, 1894); J. S. Corbett, *Drake and the Tudor Navy* (2 vols., ib., 1898); *Cambridge Modern History*, vol. iii (New York, 1905).

MEDINET EL FAYUM, me-dē'nēt el fi-ōm'. The capital of the Egyptian Province of Fayum (q.v.), situated on the Bahr-Yusuf, 55 miles south of Cairo (Map: Egypt, C 2). It is a well-built town, with an interesting mosque and a fine bazar. The chief industry is the manufacturing of woollens; there is a considerable trade in grain, woollens, and roses. The town is the seat of an American mission. Pop., 1897, 31,262; 1907, 37,320.

MEDINET HABU, me-dē'nēt hā-bōō'. The modern Arabic name of a ruined Coptic village, built in early Christian times, on the west bank of the Nile in about lat. 25° 50' N. It stood around and upon the ruins of a group of temple buildings in the western quarter of ancient Thebes. These ruins include a small temple built by Queen Hatasu and King Thothmes III, with additions by several later monarchs, and a large temple built after the model of the Rameseum (q.v.) by Ramses III. The larger temple originally stood within an inclosure surrounded by a wall of which considerable traces yet remain. The main entrance to the inclosure is through a gateway in a massive pavilion built

in imitation of a Syrian fortress and containing several chambers whose walls are beautifully decorated with reliefs. Within the inclosure a great pylon gate faces the pavilion and gives entrance to a colonnaded court 115 feet in length and about the same in breadth. A second pylon gate forms the entrance to a second colonnaded court (125 feet long and 138 feet broad) which in Christian times was converted into a church. At the upper end of this court is a terrace from which a door leads to the hypostyle hall, supported by 24 columns. To the rear of the hall are two smaller halls, and a number of chambers, most of which are in a ruinous condition.

Close to the temple of Ramses III lie the buildings of the smaller temple. Between two pylons—the outer built by Ptolemy X, the inner by Taharka—is a small chapel (32 feet long), built by Nectanebo. The inner pylon forms the entrance to a court, at the upper end of which is the temple built in the eighteenth dynasty by Hatasu and Thothmes III. It consists of a chamber surrounded by a colonnaded portico and adorned with reliefs and inscriptions. To the rear lie six smaller chambers, in one of which is a shrine for a divine image. Consult: *Description de l'Égypte* (Paris, 1809–29); Sir J. G. Wilkinson, *Topography of Thebes* (London, 1835); Johannes Dümichen, *Geschichte des alten Aegyptens* (Berlin, 1878); Daressy, *Notice explicative des ruines de Medinet Habu* (Cairo, 1897). See also THEBES.

MEDING, mǎ'ding, OSKAR (1829–1903). A German novelist, whose pseudonym was Gregor Samarow. He was born in Königsberg, Prussia, studied law, and in 1870 retired from the civil service. From 1873 to 1879 he lived in Berlin and then at Castle Wohldenberg, and in 1900 settled at Charlottenberg. His novels are sensational and deal mostly with modern politics. He wrote, under the pseudonym of Samarow, *Um Scepter und Kronen*, a cycle (1872–76); *Die Römerfahrt der Epigonen* (1874; 4th ed., 1887); *Höhen und Tiefen* (20 vols., 1879–80); *Krieg oder Frieden* (1897); *Ein Gespenst* (1902). He also wrote under his own name and the pseudonym Leo Warren. More purely historical and biographical are his *Memoiren zur Zeitgeschichte* (1881–84); *Erinnerungen aus der Zeit der Gärung und Klärung* (1896); *Aus vergangenen Tagen* (1896).

MEDIOLANUM. The Latin name of Milan (q.v.).

MEDITERRANEAN (méd'i-te-rā'nē-an) **FEVER**. See MALTA FEVER.

MEDITERRANEAN RACE (Lat. *mediterraneus*, midland, from *medius*, middle + *terra*, land). That portion of the white or Caucasian division of mankind dwelling now or formerly about the Mediterranean Sea, characterized by long heads and faces, dark brown or black hair, dark eyes, medium stature, slender bodies, and broad noses. It is called Iberian by English ethnologists, Ligurian by the Italians, Ibero-Insular or Atlanto-Mediterranean by Deniker, and Ibero-Pictish by Rhys.

There are four subraces of the Mediterranean race. In the southwestern portion of Europe, including Spain and Portugal, and moving onward as far as Iceland and Scotland, were the Iberians (q.v.), who left their name on the Iberian peninsula. In the middle projection into the Mediterranean were the Ligurian subrace, whose territory stretched westward into southern France. The eastern peninsula and the isles

of Greece were the home of the Pelasgians (q.v.), who moved northwestward through ancient Illyricum into Italy and are supposed to have been of one race with the Hittites (q.v.) of Asia Minor. The northeastern and north African subrace may be called in general terms Hamite (see HAMITES), to which belonged among others the Egyptians and Libyans. Consult Giuseppe Sergi, *The Mediterranean Race* (New York, 1901), with references to his numerous writings and the best authorities.

MEDITERRANEAN SEA. A great inland sea of the Eastern Hemisphere, almost entirely inclosed by the continents of Europe, Asia, and Africa, and communicating with the Black Sea by the Dardanelles, the Sea of Marmora, and the Bosphorus (Map: Europe, D 5). It extends from long. 5° 21' W. to 36° 10' E., a distance of 2320 miles. Its breadth differs widely in different parts, the maximum breadth being 1080 miles. It is connected with the Atlantic by the Strait of Gibraltar. The south or African coast is comparatively smooth and unindented. The north or European coast, on the other hand, is extremely broken, with several long peninsulas, deep bays and gulfs, and many islands. It abounds in good harbors, which early conducted to extensive commerce. The Balearic Isles, Sardinia, Corsica, Sicily, Crete, and Cyprus are the largest islands. The Italian peninsula, with Sicily and the extended shallows that lie between Sicily and Tunis, divides the Mediterranean into two parts.

The depth of the Mediterranean differs greatly in different parts, the maximum depth being 14,400 feet in the eastern basin south of the Morea and 12,200 feet in the western basin east of Sardinia. The depth at the Strait of Gibraltar is over 2500 feet, while 50 miles outside the water shoals to 1200 feet. The specific gravity and salinity of the water are slightly greater than those of the Atlantic, probably because of greater evaporation over the Mediterranean, the proportions being 1.029 to 1.028. The temperature of the surface water in summer is commonly a few degrees higher than that of the Atlantic in the same latitudes, and the temperature at depths is much higher, as is often the case in partly inclosed seas. While the temperature in the greater depths of the Atlantic is very near the freezing point, in the Mediterranean it reaches only 54° F. to 56° F. In winter the surface temperatures do not differ materially. The tides are very slight, at most places being only a few inches in height. In the summer the northeast trades blow over the Mediterranean, while in the winter, with the shifting of the wind belts, the prevailing winds are westerly. Specially designated winds are the Bora, in the Adriatic, and the Sirocco, blowing from the African desert.

The great rivers which flow into the Mediterranean are few in number, the principal ones being the Ebro, Rhone, and the Po from Europe, and the Nile from Africa. Into the Black Sea flows much more water, hence there is a constant current from the Black Sea into the Mediterranean. From the Atlantic flows a constant surface current into the Mediterranean, due probably to the excess of evaporation over supply in the latter body of water, while there is a lower current flowing in the contrary direction. The chief divisions of the Mediterranean are known as the Levantine Sea (in the east), the Ægean Sea, Ionian Sea, Adriatic Sea, Tyrrhenian Sea

(immediately west of the peninsula of Italy), and Balearic Sea.

Of the European sea fishes over 400 species inhabit the Mediterranean Sea, some of which are peculiar to it. It has a greater number of species than the British and Scandinavian seas, but does not nearly so much abound in useful kinds. The sponge, tunny, and sardine fisheries are important on some parts of its coasts. It is rich in red coral, which is procured in great quantity on the coasts of Provence, of the Balearic Isles, and of Sicily, but particularly on the coasts of Tunis and Tripoli in Africa.

The shores of the Mediterranean Sea are in many parts subject to frequent earthquakes. Besides the existing active volcanoes of Etna, Vesuvius, and Stromboli, there are many evidences of recent volcanic action, and instances have occurred of islands suddenly upheaved by it, where volcanic fires have appeared for a short time.

Bibliography. W. H. Smyth, *The Mediterranean: Memoir Physical, Historical, and Natural* (London, 1854); R. L. Playfair, "The Mediterranean, Physical and Historical," in *Smithsonian Institution Report, 1890* (Washington, 1891); J. Cook, *The Mediterranean and its Borderlands* (Philadelphia, 1910); Angelo Mosso, *Dawn of Mediterranean Civilization* (London, 1910).

MEDITERRANEAN SUBREGION. In zoögeography, that subdivision of the Palaearctic region which includes the basin of the Mediterranean Sea, Asia Minor, Persia, and the south coast of Asia as far as the Indus. The Canary, Azores, and Madeira islands are also included. It is bounded on the north by the line of mountains which extends from the Pyrenees to the Himalayas, and on the south by the Atlas Mountains, the deserts of northwestern Africa and central Arabia, and east of that by the Indian Ocean. It is a region of subtropical warmth, and except along the north shore of the Mediterranean is largely treeless, arid, and elevated. Within recent times the Mediterranean has been of much less extent, enabling animals to pass freely across its basin at two or more places; and much of the country now barren was formerly wooded. It is not surprising to find, therefore, a general similarity and great variety of life throughout the entire area. Among the possible indigenes of this subregion were the horse, camel, and some other now wholly domesticated animals. Of the few remaining or recently extinct mammals of the larger sort, the Barbary ape, fallow deer, aoudad, moufflon (of Sardinia), and civets are most prominent. Several gazelles and antelopes, which do not range south of the Sahara, the Asiatic wild ass, and many small animals are peculiar. Most of the north European birds pass across it in their migration to and from their winter homes; but it has many resident species of its own, especially among the birds of prey and the game birds. See **DISTRIBUTION OF ANIMALS**; and consult the accompanying maps, and the authorities there cited.

MEDJIDIE, mə-jid'ī-ā (Turk. *majidi*, from Turk., Ar. *majid*, glorious, from Ar. *majd*, glory, from *majada*, to be glorious). A Turkish order of distinction, first instituted in 1852 by the Sultan Abd ul Medjid. The Order of Medjidie has five classes, each differing in size, the decoration on which is a silver sun of seven triple rays, the crescent and star alternating with the rays. In the centre of the decoration, on a circle of red enamel, are the legend signifying

"zeal, honor, and loyalty" and the date 1268, the Mohammedan calendar year corresponding to 1852. The Sultan's name is inscribed on a gold field within this circle. The first three classes of the order are worn suspended from the neck, and the fourth and fifth on the left breast. A star closely resembling the badge is worn on the left breast by the wearers of the first-class order, and on the right breast by those of the second class. The ribbon is red with green borders. See **PLATE OF ORDERS**.

MEDLAR (OF. *medler*, *mesler*, *meslier*, *medlar* tree, from *mesle*, *mesple*, *neple*, Fr. *nêfle*, It. *nespila*, *medlar* fruit, from OHG. *mespila*, *nespela*, Ger. *Mispel*, *medlar*, from Lat. *mespilus*, Gk. μέσπιλον, *mespilon*, μεπίλη, *mespilē*, *medlar*; probably connected ultimately with Heb. *shāpel*, to be low), *Mespilus*. A genus of trees or shrubs of the family Rosaceæ sometimes combined with the genus *Pyrus* by botanists. The common *medlar* (*Mespilus germanica*), a large shrub or small tree, spiny in a wild state, but destitute of spines in cultivation, is a native of, and in general cultivation in, the south of Europe and the temperate parts of Asia, seldom seen in America. It has lanceolate leaves, not divided nor serrated, solitary large white flowers at the ends of small spurs, and somewhat top-shaped fruit, of the size of a small pear or larger, according to the variety. The fruit is very astringent, even when ripe, and is not eaten until its tough pulp has become soft and vinous by incipient decay.

MEDLEY. See **POTPOURRI**.

MEDLEY, SAMUEL (1738-99). Baptist pastor in Liverpool, England, from 1772, and favorite hymn writer. In early life he was in the navy, but was obliged to retire on account of wounds in 1759. He then taught school, till in 1767 he became a preacher. Two of his hymns, "Oh, could I speak the matchless worth" and "Awake, my soul, to joyful lays," are well known. Collections of his hymns were published in 1785, 1794, and 1800. Consult *Memoirs* by his son (1800) and his daughter (1833).

MÉDOC, mă'dōk'. See **WINE**.

MEDOWS, mēd'ōz, SIR WILLIAM (1738-1813). An English soldier. In 1756 he entered the British army, in which he served for many years, first in Germany, then in the war with the American Colonies, in which he commanded the Fifty-fifth Regiment. He was soon placed at the head of the First Brigade of Grenadiers and distinguished himself by his bravery at the battle of Brandywine and in the expedition of 1778 against Santa Lucia. He afterward lived in India from 1783 to 1792, was Governor of Bombay in 1788-90, and commander in chief of Madras in 1790-91. His military renown was greatly increased by gallant conduct at the siege of Seringapatam in 1792, and in 1793 the rank of lieutenant general was conferred upon him. In 1798 he was made general and was Governor of the Isle of Wight, and afterward, as the successor of Cornwallis, was commander in chief in Ireland (1801-03).

MEDRANO, mă-drā'nō, FRANCISCO DE. A Spanish poet of the late sixteenth and early seventeenth centuries, born at Seville. (He is not to be confused with the Sevillian cleric and poet, Dr. Sebastián Francisco de Medrano, who died in 1653.) It is known that he visited Rome, but no other details of his life are authenticated. He is one of the best of Spanish lyric poets, and is especially noted for his odes in the manner of Horace. His works

were first published at the end of the *Sestinas*, or *Remedios de Amor* (an imitation of Ovid), composed by Pedro Venegas de Saavedra, a poet of Seville (1617). They are reprinted in Rivadenera's *Biblioteca de autores españoles*, vols. xxxii, xxxv, and xlii (1854); and the author's name appears in the Academy's *Catálogo de autoridades de la lengua*.

MEDRESS, or MEDRESSE. See MADRASAH.

MEDULLA OB'LONGA'TA. See NERVOUS SYSTEM AND BRAIN.

MEDULLARY RAY (Lat. *medularis*, pertaining to marrow, from *medulla*, marrow). The woody cylinder of stems is usually broken up into what are called "vascular bundles" by plates of intervening tissue. These vertical plates, which in cross section are seen to radiate from the pith to the cortex, crossing the vascular cylinder, are medullary rays or pith rays. These plates are relatively short in the vertical direction, so that they do not divide the woody cylinder into long bundles. When secondary thickening occurs in a woody stem new medullary rays begin in the new wood. In the cross section of a woody stem several years old, therefore, two kinds of medullary rays appear, viz., the primary ones, which extend from pith to cortex, and secondary ones, which traverse only the new wood or parts of it. See WOOD.

MEDULLARY SARCO'MA. A variety of cancer, also known as encephaloid, cellular cancer, medullary cancer, fungus medullaris, etc. It grows more quickly, distributes itself more rapidly, attains a more considerable bulk, and is more rapidly fatal than any other form of cancer. See TUMOR.

MEDULLA SPINALIS. See NERVOUS SYSTEM AND BRAIN.

MÊDÛM, mâ-doom'. A village in Egypt, on the western side of the Nile, some 40 miles south of Cairo, in about lat. 29° 30' N. Near it, on the edge of the desert, is the pyramid of King Snefru (q.v.), the first King of the fourth dynasty and the immediate predecessor of King Cheops (q.v.). From a great mass of rubbish, which covers its base, it rises in three stages to the height of about 122 feet, the upper stage being almost entirely destroyed. The outer walls consist of finely polished blocks of Mokattam stone, beautifully joined together. The pyramid was opened in 1881 by Maspero, who discovered a long passage leading from the north face into the sepulchral chamber, which is built upon the surface of the underlying rock. The chamber had, however, been robbed as early as the time of the twentieth dynasty, and in it were found only some broken fragments of the wooden coffin and a wooden jar. Flinders Petrie, who later made a careful examination of the pyramid, found against its eastern face a funerary chapel consisting of an open court and two small chambers. Ancient visitors to the chapel had left upon its walls numerous graffiti, in five of which Snefru is mentioned as the King to whom the pyramid was attributed. Petrie's researches showed that the present peculiar form of the pyramid resulted from the removal of its outer layers in order to obtain stone for building purposes.

Near the pyramid are the tombs (mastabas, q.v.) of a number of high personages of Snefru's court. The most important of them are the mastabas, richly adorned with mural paintings, of Prince Rê-hotep and Nofret, his wife, and of Prince Nofer-ma't and his spouse, Yetet. The

statues of Rê-hotep and Nofret, found in their tomb, are now in the Museum of Cairo. In the cemetery of Mêdûm have been found a number of graves exhibiting a peculiar mode of burial. The bodies lie upon the left side, with the face towards the east and the knees drawn up; coffins and the usual accessories of Egyptian graves are absent. Consult W. M. F. Petrie, *Mêdûm* (London, 1892), and British School of Archæology in Egypt, *Meydum and Memphis*, vol. iii (ib., 1910).

MEDUNTA. See NANTES.

MEDU'SA. See GORGO.

MEDUSA (Lat., from Gk. *Médousa*, *Medousa*, name of one of the three Gorgons, from *mêdein*, *medein*, to rule). A general name applied to the disklike, umbrella-shaped jellyfish, with long marginal feelers, and so called from their resemblance to the fabled Medusa's head. (See Plate.) While the term "medusa" is now generally applied to the sexual free-swimming adult stage of any hydroid, it is particularly applicable to our common North Atlantic *Aurelia flavidula* of the class Scyphozoa (the group formerly called Discophora). Another general name is aculeph.

Our most abundant medusa is *Aurelia flavidula*, which late in summer abounds along the coast from New York northward. It grows to

FIG. 1. *AURELIA FLAVIDULA*.
Adult, natural size, seen from above.

the diameter of from 8 to 10 inches, becoming fully mature in August. Its rather tough jelly-like disk is moderately convex and evenly curved, while four thick oral lobes depend from between the four large genital pouches; the edge of the disk is minutely fringed to the ends of the tentacles. On the fringed margin are eight eyes, each covered by a lobule and situated on a peduncle, and occupying as many slight indentations, dividing the disk into eight slightly marked lobes. The subdivisions of the water-vascular canals or tubes are very numerous and anastomose at the margin of the disk, one of them being in direct communication with each eye peduncle. When in motion the disk contracts and expands rhythmically, on the average 12 or 15 times a minute. On the approach of danger the

MEDUSÆ AND SIPHONOPHORA

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY

- 1 DESMOMEMA ANNAETHE, $\frac{3}{5}$ NATURAL SIZE, FROM SOUTH AMERICA
- 2 FLOSCULA PROMETHA, $\frac{3}{5}$ NATURAL SIZE, FROM INDIAN OCEAN
- 3 CHRYSAORA MEDITERRANEA, $\frac{1}{6}$ NATURAL SIZE, FROM SMYRNA
- 4 CYSTALIA MONOGASTRICA, MAGNIFIED FOUR TIMES, FROM CEYLON

animal sinks below the surface. Though it has lasso cells, it is not poisonous to bathers, while the great *Cyanea arctica* is very much so.

FIG. 3. SCYPHISTOMA OF *AURELIA FLAVIDULA*, AT DIFFERENT STAGES. Magnified. (After Agassiz.)

The *Aurelia* spawns in late summer, the females being distinguishable by their yellow ovaries, the corresponding male gland being roseate, while the tentacles of the female are shorter and thicker than in the males. The eggs pass out of the mouth into the sea along the channeled arms, and in October the ciliated gastrula (Fig. 2) becomes pear-shaped and attaches to rocks, dead shells, or seaweeds, and then assumes a hydra-shaped scyphistoma stage (Fig. 3), with often 24 very long tentacles; in this stage it remains about 18 months. Towards the end of this period the body increases in size and divides into a series of cup-shaped disks. These saucer-like disks are scalloped on the up-turned edge, tentacles lead out, and the animal assumes the strobila stage (Fig. 4). Finally the disks separate, the upper one becomes detached and with the other disks swims away in the ephyra form (Fig. 5). When about a fifth of an inch in diameter, and towards the middle or end of the summer, this young medusa becomes an adult aurelia.

FIG. 4. STROBILA OF *AURELIA FLAVIDULA*.

Other forms of greater beauty occur in the Mediterranean and the tropics. A much larger kind of medusa than *Aurelia*, *Cyanea arctica*, is common on the Grand Banks and off the coast of northern New England. It sometimes attains a diameter across the disk of from 3 to even 5 feet, though it is produced from a scyphistoma not more than half an inch in height. Its tentacles stream behind, sometimes to the length of several fathoms, and poison the hands of fishermen. Species of *Pelagia* do not undergo an alternation of generations (see PARTHENOGENESIS), but grow directly from the egg, without passing through a strobila stage.

FIG. 5. EPHYRA OR EARLIEST FREE CONDITION OF *AURELIA*. (After Agassiz.)

For various Mediterranean and tropical forms, see Colored Plate of MEDUSÆ AND SIPHONOPHORE.

Medusæ shelter various kinds of animals, which live as fellow boarders or commensals, i.e., temporary nonattached parasites. Some of them live in or under the mouth cavity or between the four tentacles of the larger medusæ. Such is the little amphipod crustacean, *Hyperia*, which lives within the mouth, while small fishes, such as the butterflyfish, swim under the umbrella of the larger jellyfishes, *Cyanea*, etc., for shelter and protection. Besides small animals of various classes, the larger jellyfishes kill by means

of their netting organs small cuttlefishes and true fishes, the animals being paralyzed by the pricks of the minute barbed darts. See CŒLENTERATA; CTENOPHORA; NEMATOCYST.

Fossil Medusæ. Because of the jelly-like nature of the body and the absence of any hard parts in medusæ, these animals would seem to present the most unfavorable conditions for fossilization. Indeed, they are rarely found in the ancient rocks, but there are some noteworthy exceptions, especially in the Cambrian and Jurassic formations. Impressions and also what have been considered to be casts of the medusoid bodies have been found in rocks of the Lower Cambrian in both Sweden and North America. The peculiar fossil called *Dactyloides* found in the green roofing slates of Granville, Washington Co., N. Y., is generally regarded as of this nature. Fine impressions of jellyfish are found in the surfaces of the fine-grained lithographic limestones of Jurassic age at Solenhofen and other places in Bavaria.

Bibliography. Louis Agassiz, *Contributions to the Natural History of the United States*, vols. iii, iv (Boston, 1862-66); Alexander Agassiz, *North American Aculephs* (Cambridge, 1865); Ernst Haeckel, "Ueber fossile Medusen," in *Zeitschrift für wissenschaftliche Zoologie*, vols. xv, xix (Leipzig, 1865-70); id., *System der Medusen* (Jena, 1880-81); id., "Report on Medusæ," in *Challenger Reports*, vol. iv (London, 1881); Von Ammon, "Ueber jurassische Medusen," in *Abhandlungen der Königlich bayerischen Akademie der Wissenschaften*, vol. xvii (Munich, 1883); C. D. Walcott, "Fossil Medusæ," in *Monographs of the United States Geological Survey*, vol. xxx (Washington, 1898). For the most recent and complete account, consult A. G. Mayer, "The Medusæ of the World," *Carnegie Institution, Publication No. 109* (3 vols., Washington, 1911). See HYDROID; HYDROZOA.

MEDUSITES. The name of peculiar star-shaped fossils that are found in the Lower Cambrian strata of Sweden. They are thought to represent the casts of the gastric cavities of jellyfishes, thus indicating the existence of medusæ in the earliest Paleozoic time.

MEDWAY. A town in Norfolk Co., Mass., 25 miles from Boston, on the Charles River and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). There are manufactories of straw and felt goods and woollens. The water works are owned by the town. Pop., 1900, 2761; 1910, 2696. Medway was once part of Medfield, but was incorporated as a town in 1713. On Feb. 21, 1676, the town was ravaged by King Philip and several of its inhabitants killed.

MEDWIN, THOMAS (1788-1869). The biographer of the poet Shelley, born at Horsham in Sussex, England, March 20, 1788. His mother, Mary, a daughter of John Pilfold, was first cousin to Elizabeth Pilfold, the mother of Shelley. Medwin and Shelley were educated at Sion House School, Brentford, and they spent their vacations together at Horsham. Medwin entered the army and became a lieutenant in 1813. With his regiment he passed some time in India. In 1819 he retired on half pay and soon quitted the service. In 1821 he went to Italy, where he associated intimately with Shelley and Lord Byron. He afterward led an unsettled life. He died at Horsham, Aug. 2, 1869. His *Journal of the Conversations of Lord Byron* (1824) created a sensation, owing to its personalities. A *Memoir of*

Shelley (1833) was afterward expanded into *The Life of Shelley* (2 vols., 1847), of which a recent edition (Oxford) appeared, with introduction and commentary by H. Buxton Forman, in 1913.

MEEHAN, mē'an, THOMAS (1826-1901). An American botanist and horticulturist, born at Potter's Bar, near London, England, and educated in the public schools of his native town and of Kew. In 1847 he came to America to manage Buist's nursery at Rosedale, near Philadelphia, and six years later started his own nurseries at Germantown. Meehan was prominent in Philadelphia, as a member of the council and "father of the small parks." He proposed the theory that sex is determined by the vitality of the branch bearing the flower. In 1883 he was elected to the city council of Philadelphia and held this office for several terms. As a member of the Philadelphia Academy of Natural Sciences and of the American Association for the Advancement of Science, he contributed to their *Proceedings*. He edited the *Gardeners' Monthly* from 1859 to 1889 and *Meehan's Monthly* from 1892 to 1901 and wrote *An American Handbook of Ornamental Trees* (1853), *The Native Flowers and Ferns of the United States* (1st series, 1878; 2d, 1880; 3d, 1887), and *Wayside Flowers* (1881).

MEEK, ALEXANDER BEAUFORT (1814-65). An American journalist and jurist. He was born in Columbia, S. C., graduated at the University of Alabama in 1833, and, having studied law, was admitted to the State bar in 1835. He served in Florida as a lieutenant of volunteers against the Seminoles in 1836 and was Attorney-General of Alabama in 1836. He was made county judge in 1842. In 1853 and 1859 he was a member of the State Legislature. There he distinguished himself by organizing and establishing the free-school system in Alabama. From 1848 to 1852 he was associate editor of the *Mobile Register*. He was a probate judge at Mobile (1854-55) and a member and Speaker of the Legislative Assembly (1859-61). He wrote: *Red Eagle* (1855); *Songs and Poems of the Southron* (1857); *Romantic Passages of Southwestern History* (1857); an unfinished *History of Alabama*.

MEEK, FIELDING BRADFORD (1817-76). An American geologist and paleontologist, born at Madison, Iowa. In 1848 he assisted in the geological survey of Iowa, Wisconsin, and Minnesota, and after completing this work was attached to the New York State Geological Survey under the leadership of James Hall. He accompanied F. V. Hayden in 1853 on a geological expedition to Dakota. During the latter part of his life he was engaged in describing the fossil invertebrates collected by government expeditions; particularly by the geological surveys of the United States and Canada. He identified and defined a large number of new species. His larger works are: *Paleontology of the Upper Missouri* (1865); *Check-List of the Invertebrate Fossils of North America* (1864); *Report on the Invertebrate Cretaceous and Tertiary Fossils of the Upper Missouri Country* (1876).

MEEK'ER, ROYAL (1873-). An American statistician, born at Silver Lake, Susquehanna Co., Pa. He graduated from Iowa State College in 1898 and studied at Columbia University (1899-1903; Ph.D., 1906) and at the University of Leipzig (1903-04). He was professor of history, politics, and economics at Ursinus Col-

lege, Collegeville, Pa., in 1905-06, and at Princeton University he served as preceptor in 1906-09 and as assistant professor of political economy in 1909-13. In 1913 he was appointed by President Wilson Commissioner of Labor Statistics. He wrote a *History of Shipping Subsidies* (1905) and contributed to the NEW INTERNATIONAL ENCYCLOPEDIA.

MEERANE, mā-rā'ne. A flourishing industrial town in the Kingdom of Saxony, 37 miles south of Leipzig (Map: Germany, E 3). It is an important centre of the textile industry and has a number of manufactories of woolen and semiwoolen materials, spinning and dyeing establishments, machine and boiler works, and manufactures of footwear, paper boxes, electric motors, buttons, and cement. Its chief educational establishments are a Realschule, a school of commerce, and a textile school. The products of Meerane are extensively exported to the Orient and America. Pop., 1900, 23,797; 1910, 25,470, chiefly Protestants.

MEERKAT, mēr'kāt, or **SURICATE**, sū-rī-kāt (Dutch, sea cat). A small, furry, diurnal, vegetable-eating and burrowing civet (*Suricata tetradactyla*) of South Africa, allied to the mongooses. It is gregarious, and a colony makes burrows close together, like a prairie-dog "town." In captivity it becomes an amusing and delightful pet. Consult Martin, *Home Life on an Ostrich Farm* (New York, 1903).

MEERSCHAUM, mēr'sham (Ger., sea foam), or **SEPIOLITE**. A compact, earthy mineral hydrated magnesium silicate. It is grayish white or white with a faint yellowish or reddish tint. It occurs in stratified earthy or alluvial deposits on the plains of Eski-Shehr and elsewhere in Asia Minor; also in Greece, at Hrubschitz in Moravia, and in Morocco. The deposits in Asia Minor are worked by pits and galleries at a depth of 24 to 30 feet. The mineral when brought to the surface is so soft as to be easily cut with a knife. It is scraped to remove any adhering material, dried in the sun for about a week, then again scraped and polished with wax. Meerschaum is used chiefly in the manufacture of bowls for tobacco pipes, and factories for their production exist in Austria and in France.

MEERUT, mē'rūt. The capital of the district and division of Meerut, United Provinces, India, 39 miles northeast of Delhi, on the Northwestern Railway (Map: India, C 3). It is irregularly laid out, with narrow, unclean streets; there are several mosques and temples, of which the Jumma Masjid, dating from 1019, is the most noteworthy. The city has a fine town hall with a library, Meerut College, a normal school, and several church schools. The military cantonment is one of the largest and most important in India. There are excellent systems of water supply and drainage, and manufactures of soap, flour, and oil. The first uprising of the Indian Mutiny of 1857 occurred here. Pop., 1901, 118,129; 1911, 116,227.

MEES, ARTHUR (1850-). An American musical conductor, born in Columbus, Ohio. He graduated in 1870 from Concordia College, Fort Wayne, Ind., and after preparation under American instructors he studied from 1873 to 1876 at Berlin under Kullak, Weitzmann, and Dorn (the latter for score reading and conducting). He was conductor of the Cincinnati May Festival Chorus, assistant conductor of the Chicago Orchestra, and then he took up his residence in New York and became the conductor of impor-

tant choral organizations. In 1898 he was elected, on the resignation of MacDowell, to the conductorship of the Mendelssohn Glee Club. In 1908 he became conductor of the Worcester Music Festival and the Cecilia Society of Boston. From 1887 to 1896 he wrote the analytical programmes for the New York Philharmonic Society. He published in 1901 *Choirs and Choral Music*, which has been accepted as a standard authority. A book of piano studies also obtained general recognition.

MEFISTOFELE, mā'fê-stô'fâ-lâ. An opera by Boito (q.v.), first produced in Milan, March 5, 1868; completely rewritten, Bologna, Oct. 4, 1875; in the United States (New York), Nov. 24, 1880.

MEGABARIE (from Gk. μέγας, *megas*, great + βαρύς, *barys*, heavy). The practical unit of pressure in the C. G. S. system; it equals one barie $\times 10^6$. See **BARIE**.

MEGACHIROPTERA. See **BAT**; **CHIROPTERA**.

MEGADACTYLUS (Neo-Lat., from Gk. μέγας, *megas*, great + δάκτυλος, *daktylos*, finger). A Triassic dinosaur. See **ANCHISAURUS**.

MEGÆRA. One of the Eumenides.

MEGÆALÆSIA, or **MEGÆALÆNSIA** (Lat., from Gk. Μεγαλῆσια, from Μεγαλή, *Megalē*, epithet of the Great Mother, fem. sing. of μέγας, *megas*, great). A festival at Rome, instituted in honor of Cybele (q.v.), the Great Mother of the Gods, in 204 B.C., when her symbol, a black stone, was brought to Rome (consult Livy, 29, 14, and see the article **CLAUDIA QUINTA**). The celebration included a stately procession in which the eunuch priests of Cybele carried through the streets the sacred ensign, games held on the Palatine and in later times in the theatres, and a great carnival. The festival lasted for seven days, April 4 to 10, and was originally under the charge of the curule ædile, later of the prætor. Consult W. W. Fowler, *Roman Festivals* (London, 1899), and Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

MEGALICHTHYS. A genus of fossil ganoid fishes, characterized by their great size and formidable appearance. The body was covered by huge bony plates, and the teeth attained a length of 4 inches or more. The remains of *Megalichthys* are found in the Carboniferous rocks of Europe and America.

MEGALITHIC MONUMENTS (from Gk. μέγας, *megas*, great + λίθος, *lithos*, stone). Gigantic monuments, the materials of which in the earliest stages of industrial development were huge undressed stones, and also associated with tumuli. Megalithic monuments are found in both hemispheres, and in the progress of culture they marked the crude beginnings of larger coöperative effort as well as of engineering and of massive architecture. A most instructive lesson as to the manner in which the stones were set on end is furnished by one of the northern tribes of Hindustan visited by Wurmbrand. These people are in a region where megalithic monuments have had a long history. A slab weighing several tons rests on a number of stout poles laid parallel and just far enough apart to allow men to walk between them. The ends of these poles are lashed to end bars and a firm gridiron frame is made beneath the slab. The whole mass is then lifted by as many men as can get into the framework, and carried to the proper place, one man beating time for their steps. The point of destination reached, the

framework is laid flat, the hole dug, and the gridiron set upright by lifting with the hands aided by shear poles, sliding props, guy ropes, and all other labor-saving devices known to them. As the angle between the gridiron and the earth increases, the labor of erection decreases, until the slab is let down carefully into its resting place.

Megalithic monuments really belong to two classes, monolithic and polyolithic. The former is a simple great slab or boulder stood on end; the latter consists of several blocks put together to form a chamber. The differences between the two classes is not great, and there are mixed examples where both exist side by side.

Monoliths receive different names in the countries where they are found, and often the same name applies to quite different things in different countries. They receive names also from the manner of grouping. The single great stone, weighing perhaps hundreds of tons, set on end, is a menhir; if a number of these stand in rows, they become an avenue or an alignment; and a stone circle is a number of menhirs arranged about a centre. The final development of this simple beginning is seen in the Egyptian obelisk, in the memorial column or shaft, or in the gigantic statue. The enormous size of many of the rude monoliths is a matter of surprise. The largest one, in Brittany, at Locmariaquer, weighs 347 tons. Thousands have been counted in Brittany and other portions of France. See **PLATE OF MEGALITHIC MONUMENTS**.

The polyolithic monument also receives different names from its associations. If a number of stones are built into a memorial pile, or over the dead, it is a cairn; a tumulus containing a dead person is in Ireland a galgal; and if a passage-way be formed on one side allowing reëtrance to a vault, it becomes a chambered barrow; a stone box in a barrow to hold cinerary urns and relics is a cistvaen. The typical composite monument of great stones belonging to this class is the dolmen (locally termed quoit), a slab of stone laid on the top of two or more upright slabs, forming a burial chamber from which the earth has been removed by the elements. The word cromlech was at one time used to denote a dolmen, as it was originally covered with a tumulus and surrounded by a circle of standing stones. The term is out of use now in England, but the French apply it to one of the former elements of the complete dolmen, the stone circle. The essential part of all is the stone box or capsule, whether underground, aboveground, or covered with a tumulus.

The areas of greatest abundance of megalithic monuments, beginning in Asia, are to be found in Japan, Burma, Assam, and the Deccan; the Persian uplands; Asia Minor, Caucasus, the Crimea, Syria, Palestine, and Arabia; across northern Africa to the Atlantic; in Spain, Portugal, western France, and Belgium; in the British Isles and Scandinavia. Examples of huge monuments are also found in northeastern Asia. See **EASTER ISLAND**.

Stonehenge, on Salisbury Plain, near Amesbury, County of Wilts, southern England, is one of the most important among the megalithic monuments of the world, since it not only is composed of immense pieces, but combines in itself a number of types. In the centre lies a great slab 15 feet in length. Just outside of this are two oval rings, the larger one made up of five pairs of trilithons, which increase in

height towards the west. The smaller oval, containing 19 monoliths, is tapering in form; outside these ovals and inclosing them is a circle of standing stones, not massive in size; outside of all is the most interesting feature of Stonehenge, a circle 300 feet in circumference, made up of immense standing stones varying in height from 18 to 22 feet, some of them 6 feet in diameter. On the top of them are blocks of similar size joining them and forming a series of doorways or trilithons. On the outside of this circle is a ditch and avenue, in which is a menhir, called the Friar's Heel.

Not the least interesting feature about these remains is the veneration and folklore that has gathered around them. No doubt the belief that the ghosts of the dead hover about them aided in the preservation of many of them. Their authorship has puzzled the antiquaries as well as the folk, by whom they were attributed to the Druids, the Celts, and other historic peoples.

The megaliths of the Pacific islands pertain, with two exceptions, to the neolithic culture. They occur in a roughly orbicular line which somewhat closely corresponds to the outer boundary of the three divisions of the South Sea islands. Stone structures are reported by savage informants as existing in the inland valleys of Bougainville, Solomon Islands, but it is not yet safe to attempt exploration, and by Prebendary Codrington in Gog of the Banks group, and in New Caledonia; these are of Melanesia. In nuclear Polynesia occur the Nanga in Fiji, the trilithon of Tonga, in Samoa walls in the mountains and the Fale-o-le-Fe'e. In southeastern Polynesia walls and platforms are found in Rapa Iti, Pitcairn, and Easter islands, and walls in the Marquesas. In Micronesia there are stone remains on Howland Island; extensive remains at Tapak, Lele, and Metalanim in the Caroline Islands; interesting structures at Tinian in the Ladrões. The walls and platforms are built of unworked country rock, in general of cyclopean dimensions, erected without builder's art or any use of cement. There are a few instances of grouped stones, approximately of the cromlech type; such are the Nanga of Fiji, the Fale-o-le-Fe'e of Samoa, the alignments of Tinian. The trilithon type is represented by a solitary instance, that at Mua in Tonga; each upright is 17 feet high; they carry a crosspiece 5 feet deep sunk its full depth into sockets chipped in the full width of the uprights. In but three instances do these megaliths vary from the true unworked paleolithic—this trilithon, and the terminalia statues of Easter Island, the product of chipping, and the Tinian alignments which after chipping have been smoothed by abrasion. In not a single instance is it necessary to deduce the use of metal. The modern Polynesian, an advanced neolithic type, has been less than 1000 years in the Pacific. The appearance of age in these megaliths and the absence of tradition of their erection (all the more noteworthy in a race which recites the history of a fragile mat through 15 generations and the story of a green-stone spearhead from even remoter antiquity) are strong evidence that the megalithic monuments of the Pacific islands far antedate the arrival of the Polynesians and are the work of a lost population.

MEGALOKASTRO. See CANDIA.

MEG'ALON'YX (Neo-Lat., from Gk. μέγας, *megas*, great + ὄνυξ, *onyx*, claw). An extinct edentate mammal, allied to *Megatherium*, found in the Pleistocene deposits of Kentucky, Tennessee, and Cuba. See MEGATHERIUM.

MEG'ALOP'OLIS (Lat., from Gk. Μεγαλόπολις, *Great City*). A town in Southwestern Arcadia, founded in 370 B.C. by Epaminondas (q.v.), who desired to make it the capital of an Arcadian confederacy and a bulwark against Sparta (Map: Greece, Ancient, C 3). Pausanias says 40 townships were combined to form the new city. It was laid out on a large scale, with strong walls 50 stadia (5½ miles) in circumference; it also had a large territory. But it by no means fulfilled expectations. It maintained its independence, indeed, against frequent Spartan attacks, sometimes with Athenian aid, sometimes with help from Macedon, but in 222 B.C. it was sacked by Cleomenes III. Though rebuilt, it never seems to have regained its importance. It was the native town of Philopœmen (q.v.), the great general of the Achaean League, and of the historian Polybius (q.v.). The city was situated in a fertile plain on both banks of the river Helisson, near its junction with the Alpheus. Excavations which were conducted on the site by the British School at Athens from 1890 to 1893 laid bare the theatre and the Thersilion, or great hall where the Arcadian Assembly met, and on the other (north) side of the river the temple of Zeus Soter, a long colonnade, and foundations of other buildings adjoining the market place.

Bibliography. E. A. Gardner and others, *Excavations at Megalopolis*, containing papers by various scholars (London, 1892); K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909); J. P. Mahaffy, *Rambles and Studies in Greece*, 307-312 (7th ed., New York, 1913). On the remains of the very important theatre at Megalopolis, consult W. Dörpfeld and E. Reisch, *Das griechische Theater* (Athens, 1896); A. E. Haigh, *The Attic Theatre* (3d ed., by A. W. Pickard-Cambridge, Oxford, 1907); E. R. Fiechter, *Die baugeschichtliche Entwicklung des antiken Theaters* (Munich, 1914).

MEG'ALOSAUR'US (Neo-Lat., from Gk. μέγας, *megas*, great + σαῦρος, *sauros*, lizard). A carnivorous dinosaur allied to, and perhaps identical with, *Ceratosaurus* (q.v.), found in the Jurassic and Cretaceous deposits of Europe and India. The North American genus *Laelaps* of Cope from the Cretaceous formations is probably identical. The animal was from 15 to 20 feet long with a medium-sized head, the jaws of which were provided with formidable teeth. The skeleton is light, and the bones are partly hollow. The fore limbs are five-toed and small

MEGALITHIC MONUMENTS

1. "MERCHANT'S TABLE" NEAR LOCMARIAQUER

2. "LINES OF MENEC" AT CARNAC

and were probably of little use in locomotion. The hind limbs, on the other hand, are large and strong and terminate in three toes armed by heavy claws. The tail was long and heavy. See CERATOSAURUS; DINOSAURIA.

MEGANEURA, mĕg'ă-nŭ'ră. See INSECTS, FOSSIL.

MEGANITE. See EXPLOSIVES.

MEGAPHONE (from Gk. μέγας, *megas*, great + φωνή, *phonē*, voice, sound). A form of speaking trumpet used to render the voice audible at considerable distances. It consists of a large funnel of tin or papier-mâché, in which the sound waves are so reflected that they issue from its mouth in approximately parallel directions. Theoretically a megaphone of parabolic section would act as the best form of megaphone, especially if the resonance of the cavity did not affect the propagation of sound by strengthening certain sounds and destroying others by interference. (See ACOUSTICS.) The size and shape of the megaphone, however, are so regulated that the usual tones of the voice undergo the largest possible amount of strengthening. For this reason a megaphone to be used with the best effect by a woman would be different in size from that suited to the deeper notes of a man's voice. The megaphone has succeeded the old speaking trumpet for use at sea and is generally employed by naval officers and mariners for communicating with the shore or with a distant vessel.

MEG'APODE. See MOUND BIRD.

MEG'APOLEN'SIS (Latinized form of *Van Mecelenburg*), JOHANNES (1603-70). The first Protestant missionary to the North American Indians. The first patroon, Van Rensselaer, brought him to America from Holland in 1642, so that he might be a missionary to the Indians on the frontier, near Albany, and in this capacity he antedated John Eliot by several years. He learned to preach in the Mohawk language and made converts among them. He also befriended the heroic Jesuit fathers, Jogues, Bressani, and Poncet. From 1649 till his death, Jan. 24, 1670, he was pastor in New Amsterdam, and it was he who urged Peter Stuyvesant to surrender without bloodshed in 1664. His Dutch account of the Mohawk Indians is translated in the *New York Historical Society's Collections*, vol. iii (New York, 1870).

MEG'ARA (Lat., from Gk. Μέγαρα). The capital of Megaris (q.v.), on the isthmus between the Peloponnesus and northern Greece. It was built at the base of two hills, Caria and Alcahous, each defended by a citadel. Two walls, built by the Athenians during their protectorate over Megara, between 461 and 445 B.C., connected the city with its chief harbor, Nisæa. In the time of Pausanias the city contained many temples and public buildings, but of these only very scanty traces are now visible, of which the most interesting are perhaps the remains of the aqueduct and fountain built by the architect Eupalinus for the tyrant Theagenes. The origin of Megara is lost in legend, but as early as the eighth century B.C., thanks to its two harbors, Pegæ on the Corinthian Gulf and Nisæa on the Saronic Gulf, it was a flourishing commercial city and sent out many colonies, of which the most famous were Byzantium, Chalcedon, the Sicilian Megara (see HYLIA), and Selinus (q.v.); to the last-named city colonists came also from the Sicilian Megara. Megara also early had vigorous trade

in the region of the Black Sea; its settlements here included Byzantium, Chalcedon, Astacus, Heraclea in Bithynia, and a Heraclea in the Crimea. Near the end of the seventh century we find it engaged in a fierce and protracted struggle with the Athenians for the island of Salamis, of which it long retained possession. From this time, too, it had to face commercial and colonizing competition in the Black Sea district from Miletus, in Sicily from Corinth and Corecra. The loss of Salamis to Athens in 598 B.C. further crippled Megara. The government had originally been in the hands of the Dorian landed aristocracy, from whom it was usurped about 620 B.C. by Theagenes, who led the popular faction and established himself as absolute ruler of the state. Upon his expulsion, however, soon after, a fierce contest took place between the democratic and the aristocratic parties. After the Persian wars Megara carried on hostilities with Corinth, against which she formed an alliance with Athens (461 B.C.). Athens established a sort of protectorate over the city and built the walls referred to above. Later the Athenians were compelled to surrender their hold on the city, and under a strict oligarchy it became a member of the Peloponnesian League. It was easily open to the attacks of the Athenians and was by the "Megarian decree" of Pericles deprived of all markets in Attica. It was frequently ravaged during the Peloponnesian War and almost captured at one time by the Athenians aided by the democratic party within (424 B.C.); they did secure Nisæa and held it until 410 B.C. After this war the city plays but a small part in history. A democratic form of government was reestablished in 357 B.C.; after the death of Alexander the Great the city passed under the control of Demetrius Poliorcetes and Ptolemy Soter successively. Demetrius, the son of Antigonus Gonatas, captured and nearly destroyed it. It was afterward partially rebuilt and finally surrendered to the Romans under Metellus. Alone among the cities of Greece it was not restored by Hadrian; Alarie still further reduced it, and in 1687 the Venetians completely destroyed it. Megara was celebrated in antiquity as the seat of the Megarian School of Philosophy, founded by Euclid, a native of the city. (See MEGARIC SCHOOL.) The site is now occupied by a prosperous Greek town, bearing the ancient name, with a population of about 6500, mostly of Albanian origin. Consult F. Cauer, *Parteien und Politiker in Megara und Athen* (Stuttgart, 1890), and K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909).

MEGARIC SCHOOL. A school of Greek philosophers who, as partial disciples of Socrates, expanded one side of their master's teaching. While the Cynic and Cyrenaic schools developed his ethical teaching, the Megaric devoted itself rather to dialectical investigations. Their principal leader was Euclid of Megara, who was probably one of the earliest disciples of Socrates. He united the ethical principle of Socrates with the Eleatic theory of one immutable substance. Consult the standard histories of philosophy, such as those of Ueberweg-Heinze, Ziller, Gomperz.

MEGARIS (Lat., from Gk. Μεγάρη). In ancient geography, a district in Greece, covering about 140 square miles, lying between the Corinthian Gulf on the north and northwest and the Saronic Gulf on the southeast (Map: Greece, Ancient, C 2). It was bounded on the north

by Bœotia, on the northeast by Attica, and on the southwest by the District of Corinth. The capital was Megara (q.v.).

MEGARON. The large outer hall or atrium of the primitive Greek house, reserved for the men, as at Mycenæ and Tiryns. See HOUSE.

MEGASPORANGIUM (Neo-Lat., from Gk. μέγας, *megas*, great + σπόρος, *sporos*, seed + ἀγγεῖον, *angeion*, vessel, from ἄγγος, *angos*, jar). The sporangium (spore case) which produces the megaspores (q.v.). Ordinarily the term is applied only among pteridophytes, because the megasporangia of seed plants have long been called ovules, and the older name remains in common use. An obsolete name is macrosporangium. See HETEROSPORY; SPORANGIUM; MEGASPORE.

MEGASPORE (from Gk. μέγας, *megas*, great + σπόρος, *sporos*, seed). In some of the pteridophytes and all of the seed plants, two kinds of spores are produced, which differ very much in size, and the larger ones are called megaspores. The significant difference between the two spores, however, is not that of size, but is the fact that the megaspore in germination produces a female plant. It follows that, when plants develop these two kinds of spores (heterosporous, q.v.), they have become sexually differentiated. In seed plants the megaspore is not shed from its sporangium (ovule), but germinates where it is formed, and this results in transforming the ovule into the seed. This means that, when spores were differentiated into megaspores and microspores, seeds became possible. An obsolete term for megaspore is macrospore. See ALTERNATION OF GENERATIONS; HETEROSPORY; SPORE.

MEGASPOROPHYLL (from Gk. μέγας, *megas*, great + σπόρος, *sporos*, seed + φύλλον, *phyllon*, leaf). In some of the pteridophytes and all of the seed plants, two kinds of spores are produced, called microspores and megaspores. These are formed by two kinds of sporangia, called microsporangia and megasporangia, and these in turn are usually borne upon different leaf structures (sporophylls), which are called microsporophylls and megasporophylls. In seed plants the megasporophylls have long been called carpels, which bear the megasporangia, called ovules, which in turn contain the megaspores. An obsolete term for megasporophyll is macrosporophyll. See HETEROSPORY; SPOROPHYLL.

MEGASTHENES (Lat., from Gk. Μεγασθένης) (fl. c.300 B.C.). A Greek writer of the early Alexandrian period. He was assigned by Seleucus Nicator (312-280 B.C.) to the service of the Governor of Arachosia, by whom he was sent on several diplomatic missions to the Indian King Sandrocottus. He published a work called *Indica* (Ἰνδικά) in four books, in which he discussed the flora and the fauna of India, as well as many of the customs of the Indians. Like Herodotus, Megasthenes admitted wonderful stories into his narrative and tried to identify foreign myths with those of the Greeks. Recent investigations, however, have shown the general trustworthiness of the work, which was the most valuable account of India possessed by Europeans down to the time of the establishment of the Bengal Asiatic Society in 1784. Diodorus (ii, 35-42) gives an abstract of the contents of the *Indica*, and there are numerous fragments in Strabo and Arrian which have been collected by Schwanbeck, *De Megasthene Rerum Indicarum Scriptore* (Bonn, 1845),

and by Müller, *Fragmenta Historicorum Græcorum* (Paris, 1841-70), vol. ii, pp. 397-439, and translated by McCrindle, "Ancient India as Described by Megasthenes and Arrian," in the *Indian Antiquary*, vol. vi (Calcutta, 1877). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1911).

MEGATHERIIDÆ (Neo-Lat. nom. pl., from *Megatherium*, from Gk. μέγας, *megas*, great + θηρ, *thērion*, dim. of θήρ, *thēr*, wild beast). An American family of edentate mammals, of which the genus *Megatherium* is the type, comprising a number of fossil ground sloths of gigantic size. It is intermediate between the modern anteaters (*Myrmecophagidæ*) and the true sloths (*Bradypodidæ*) and contains the genera *Hapalops*, *Hyperleptus*, and others of the Santa Cruz formation of Miocene age in Patagonia, and *Megatherium*, *Mylodon*, *Megalonyx*, and *Scelidotherium* of the Pleistocene of North and South America. See MEGATHERIUM.

MEGATHERIUM (Neo-Lat., from Gk. μέγας, *megas*, great + θηρ, *thērion*, dim. of θήρ, *thēr*, wild beast). A gigantic fossil edentate mammal, larger than a rhinoceros, which lived in comparatively recent geological time in South America and of which skeletons are found in the pampean deposits (Pleistocene) of Argentina, Chile, and Brazil. Its skeleton, which shows points of resemblance to both the anteaters and sloths, is of very massive construction, indicating a most powerful animal, about 18 to 20 feet in length. The head was small, the jaws of a form to support powerful chewing muscles, and the teeth, of which there are only 10 upper and 8 lower molars, are of a prismatic form and of such size as must have rendered them most effective grinding organs. The structure of the forward portion of the jaws shows the lips to have been elongated and prehensile, and the grooved inside of the lower jaw suggests a powerful prehensile tongue, which served to pull off the twigs and leaves upon which the animal fed. The neck was short and strong, the trunk heavy and round. The leg bones are extraordinarily massive and of peculiar form. The fore limbs are longer than the hind limbs, and the form of their joints indicates considerable flexibility; they probably served somewhat as arms. The very heavy hind-limb bones and the tail bones indicate that the greater portion of the weight of the animal was borne by these parts, and it is reasonable to conclude that the favorite position of the beast was that of resting upon its haunches. The surfaces of the bones are provided with ridges and rough places for the attachment of powerful muscles. The size of the animal, its evidently very great muscular power, and the structure of its hind quarters indicate that it squatted beside a tree and with its mobile fore limbs, the middle fingers of which were armed with strong claws, pulled down and broke off the upper trunk and branches from which it derived its food. The body of the animal is thought to have been covered by tough hide and coarse hair. *Megatherium* was one of the first fossil mammals described. A nearly complete skeleton was found in 1789 near Buenos Aires and sent to the museum of Madrid, where it was described and named by Cuvier, *Megatherium americanus*.

Three other allied genera are *Scelidotherium*, *Megalonyx*, and *Mylodon*, all of Pleistocene age. Of these, *Scelidotherium*, from South America, closely resembles a gigantic anteater in the struc-

ture of its skull. *Megalonyx*, differing slightly from *Megatherium* in the structure of its teeth, has been found in the cave deposits of Kentucky and Tennessee and in the Pleistocene beds of Cuba. The remaining form, *Myiodon*, remains of which have been found in Kentucky and South America, is the only member of the family Megatheriidae in which the skin contains calcareous plates similar to those of the other group of gigantic edentates, the Glyptodontidae; and in *Myiodon* these plates, though numerous, are small and not joined to each other. Consult Woodward, *Outlines of Vertebrate Paleontology* (Cambridge, 1898), and G. B. Scott, *A History of Land Mammals in the Western Hemisphere* (New York, 1913).

MEGENBERG, KONRAD VON. See KONRAD VON MEGENBERG.

MEGERLE, mĕğ'ĕr-le, ULRICH. See ABRAHAM A SANTA CLARA.

MEGIDDO, me-gid'dō. A fortified city of great importance in ancient Syria, situated in the valley of Esdraelon, at the modern Tell el Mutesellim, 4 miles northwest of Tell Ta'annak, as recent excavations have shown (Map: Palestine, C 2). It is mentioned in the reign of Thothmes III (1501-1447 B.C.), in the Amarna letters (c.1400 B.C.), in a papyrus of the time of Seti I (c.1320-1310 B.C.), and in an inscription of Shishak (960-939 B.C.), and is also referred to in Assyrian inscriptions. But the ancient fortifications uncovered by the Deutsche Orientgesellschaft go back to the third millennium B.C. According to Josh. xii. 21 it was the residence of a Canaanitish king at the time of the Hebrew invasion. From Judg. i. 27 it is evident that it did not fall into the hands of the tribes invading the plain. David possibly conquered it, and Solomon fortified it (1 Kings ix. 15). King Ahaziah of Judah found refuge there when fleeing from Jehu of Israel in 843 B.C. (2 Kings ix. 27). Jerome calls the valley of Esdraelon "the Plain of Megiddo." The "waters of Megiddo," mentioned in Judg. v. 19, probably refer to the river Kishon, the present Nahr el Makatta. At Megiddo, King Josiah was overpowered by Pharaoh Necho in 608 B.C. To the south of the tell on which the old castle of pre-Israelitish times stood and the inclosing brick wall, 28 feet thick, there is an abundant stream, and in Roman times a fortified post was established here, the Legio of the Onomasticon, the modern El Lejjun. A number of gems and cylindrical texts were discovered at Tell el Mutesellim, among them the oldest-known Hebrew seal, which belonged to Shama, a high official of Jeroboam, probably Jeroboam II (782-740 B.C.). Consult: Müller, *Asien und Europa nach altägyptischen Denkmälern* (Leipzig, 1893); Buhl, *Geographie des alten Palästina* (Freiburg, 1896); Savignac, "Les fouilles de Megiddo," in *Revue Biblique* (Paris, 1907); Schumacher, *Tell el Mutesellim: Bericht über die 1903 bis 1905 veranstalteten Ausgrabungen I* (Leipzig, 1908).

MEG MER'ILLES. A very tall, masculine gypsy woman in Scott's *Guy Mannering*. This character in the dramatized form of the novel was a favorite rôle played by Charlotte Cushman.

MEG'NA, or **MEGHNA**. A deltaic estuary of Bengal, British India, forming the outlet of the Brahmaputra, of the easternmost channel of the Ganges (qq.v.), and of tributary streams. It flows into the Bay of Bengal by four mouths, which inclose three large islands. It is naviga-

ble by steamers and large river craft, which, however, are often imperiled by shifting sands and snag and by the tidal bore, which ascends at the rate of 15 miles an hour and often attains over 18 feet in height during the equinoxes; the river is also subject to cyclonic storm waves, which at various times have caused great destruction of property and loss of life.

ME'GRIM. See MIGRAINE.

ME'GRIMS (OF., Fr. *migraine*, It. *migrana*, *emigrana*, from Lat. *hemicranium*, from Gk. ἡμικρανία, *hēmikrania*, pain in one side of the head, from ἡμι-, *hēmi*-, half + κρανίον, *kranion*, head), CONGESTION OF BRAIN, or BLIND STAGGERS. A disease of the horse. It is indicated by the following symptoms: the animal when at work reels, and then either stands for a minute dull and stupid or falls to the ground, lying for a time partially insensible. The eyes are staring, breathing is hurried and stertorous, and the nostrils are widely dilated. Occasionally these symptoms are followed by coma, convulsions, and death. More frequently, however, the animal gains relief in a little while. The attacks come on suddenly, are often periodical, are most frequent during hot weather, and when the animal is drawing up a hill or exposed during heavy work to the full rays of a hot sun. Liability to megrims constitutes unsoundness and usually depends upon the circulation through the brain being temporarily disturbed. Horses subject to megrims should be used with a well-adjusted collar, with a strap running to the girth to hold down the collar when pulling upgrade, so as to prevent, as much as possible, pressure on the veins carrying the blood from the head; they should be moderately and carefully fed and during hot weather be given plenty of water and an occasional laxative. Consult Leonard Pearson et al., *Special Report on Diseases of the Horse* (Washington, 1911), and James Law, *Text-Book on Veterinary Medicine*, vol. iii (Ithaca, N. Y., 1910-12). See MENINGITIS, *Cerebrospinal*.

MEHÁDIA, mē-há'dē-ō (Lat. *Ad Mediam*). A small town in the County of Krassó-Szörény, Transylvania, Hungary, situated in the Carpathians, on the Belareka River, 6 miles west of the Rumanian and 15 miles north of the Serbian frontier (Map: Hungary, H 4). It is noted for its old cemetery with Greek and Roman inscriptions and for its Roman ruins. In the vicinity are coal mines. Pop., 1911 (commune), 2497, mostly Rumanians. About 3 miles southeast is the bathing resort of Herkulesbad, with numerous hot springs (some of them containing sulphur), ranging in temperature from 106° F. to 143° F. They were known to the Romans as *Thermæ Herculis*. The place is visited by about 7000 guests annually.

MEHEMET AALI, PASHA, 1815-71. See AALI, MEHEMET, PASHA.

MEHEMET ALI, mā'he-mēt ā'lē (1769-1849). Viceroy of Egypt. He was born in 1769 at Kavala, a little town in Macedonia. Left an orphan, he was taken into the service of a captain of the janizaries. He learned much of military matters and of intrigue, made a rich marriage in 1787, and was thus able to obtain a commission as an officer in the irregular troops of the Sultan. Through relations which he formed with a Marseilles merchant he amassed wealth in trade. He received a command in Egypt to coöperate with the British against the French invaders and at length became commander of the Albanian or Arnaut Corps. In

1805 he was recognized by the Porte as Viceroy of Egypt and Pasha of Three Tails, but was soon involved in disputes with the Mamelukes (q.v.), who had long practically ruled Egypt. The struggle was finally terminated in 1811 by the massacre of the greater number of these at Cairo. The rest fled to Upper Egypt, but were expelled by Mehemet in the following year. They then took refuge in Nubia, but in 1820 he followed them there and completely vanquished them. From 1811 to 1818 he carried on war against the Wahabis in Arabia, who were subjugated by his adopted son, Ibrahim Pasha. Shortly after he conquered Kordofan, added it to his dominions, and opened a great trade in slaves from the interior of Africa. About this time he began to reorganize his army on something like European principles, built a fleet, and erected fortresses, military-shop works, and arsenals. He sent a strong force to assist the Sultan in suppressing the Greek revolt in 1824, but his new fleet was destroyed at Navarino in 1827. In 1830 the Porte conferred on him the Government of Crete, but this did not satisfy his ambition. He determined to annex Syria to his dominions and in 1831 dispatched an army under Ibrahim Pasha, who overran the country, defeating the Turks at Horas, July, 1832, and by his victory at Konieh (Dec. 20, 1832) brought the Turkish government to the brink of ruin. Russia now stepped in, and a treaty was concluded (May 4, 1833) by which Syria was handed over to Mehemet. Neither of the belligerents was satisfied, and Mehemet continued to plot till Sultan Mahmud II declared war in 1839 against his dangerous subject. At Nisib, June 24, 1839, the Turkish army was crushed by the forces of Mehemet Ali, but the European Powers again interfered, and Mehemet was compelled to give up Syria and Crete and to content himself with the hereditary viceroyalty of Egypt (1841). Mehemet was at once a remorseless tyrant and an able, progressive administrator and did much to develop Egypt. He cleared his dominions of robbers, executed great public works, and may be said almost to have introduced the cultivation of cotton, indigo, and sugar into the country. He also established a system of national education in Egypt. He died Aug. 2, 1849.

Murray, *Memoir of Mehemet Ali* (London, 1898); Dehérain, *Le Soudan égyptien sous Mehemet* (Paris, 1898); W. A. Philipps, in *Cambridge Modern History*, vol. x (Cambridge, 1907), containing a bibliography. See EGYPT.

MEHEMET ALI PASHA, pâ-shâ' (1827-78). A Turkish soldier. He was born in Magdeburg, Prussia, and his name originally was Karl Detroit. In 1843 he ran away to sea and embarked for Turkey. Aali Pasha, later Grand Vizier, took an interest in him and in 1846 sent him to a military school. He embraced Mohammedanism, received a commission in the Ottoman army in 1853, and fought against Russia in the Crimean War. In 1865 he was made a brigadier general and Pasha, in 1875-76 he commanded in Bosnia, and in the war of 1877-78 against Russia he was at the head of

the Turkish army in Bulgaria. He was successful in his operations on the river Lom (August-September, 1877), but was afterward forced back by the enemy. He failed to effect a junction with Suleiman Pasha and was superseded by the latter (1878). He was second plenipotentiary at the Berlin Congress, and on his return was sent to Albania, where he was mobbed and killed by insurgents at Diakova, Sept. 7, 1878.

MEHER'IN. A small tribe of Iroquoian stock, formerly living on the lower course of the river of the same name, on the Virginia-Carolina border. They made some trouble during the Tuscarora War of 1711-12, but soon afterward disappear from notice, having apparently been absorbed by that tribe or by the Tutelo. See CONESTOGA.

MEHRING, mā'ring, FRANZ (1846-). A German writer, especially on Socialism. He was born in Schlawe, Pomerania, and became an editor of *Die Neue Zeit*. He wrote *Fall Lindau* (1890), *Lessing-Legende* (1893), *Gustav Adolf* (1894), *Schiller* (1905), and *Jena und Tilsit* (1906); but he is better known for his valuable work on German Socialism, partly in German periodicals and partly in his books *Die deutsche Sozialdemokratie* (3d ed., 1879), *Geschichte der deutschen Sozialdemokratie* (1897), *Aus dem literarischen Nachlass von Karl Marx, Friedrich Engels, und Ferdinand Lassalle* (1902), and *Sozialistische Neudrucke* (1908 et seq.), writings of Engel, Weitling, Wolff, and Lange.

MÉHUL, mā'ul', ETIENNE NICHOLAS (1763-1817). A French operatic composer, born at Givet. At the age of 10 he was organist of his native village; in 1778 he went to Paris, where he gained the interest of Gluck. After several unsuccessful efforts in composition his *Euphrosine et Corradin* finally achieved fame (1790), and other compositions previously written were then brought to light. *Stratonice* appeared in 1792; and this was followed by patriotic national hymns for the Army of the Republic, entitled "Le chant du départ," "Le chant de victoire," "Le chant du retour," which won him high popularity. Other works appeared in rapid succession; in 1806 *Uthal*; previously, *Une folie, ou les aveugles de Tolède* (1802); and in 1807 *Joseph*, his most esteemed composition. In 1795 he was elected a member of the Academy, and also appointed an inspector of the Conservatory, which had but recently been established. His works comprise every form of music, but it is wholly by his operas that he is known to fame. They are marked by dramatic truth, noble melodies, and, though his work constantly shows a lack of thorough training, he was one of the first French composers adequately to express the meaning of the words in music. Consult A. Pougin, *Biographie* (Paris, 1889), and R. Brancour, *Méhul* (ib., 1912).

MEI, mā, or **MAY**, LEV ALEXANDROVITCH (1822-62). A Russian poet. He was born in Moscow and was educated at the Institute of Tsarskoi Selo. He attracted a great deal of attention by his drama *Tsarskaya Nevēsta* (The Bride of the Czar) (1849), which was followed by the dramas *Servilia* and *Pskovitianka* (The Woman of Pskov). Besides publishing several minor poems on classical and biblical themes, he also considerably enriched Russian literature by his translations from Milton, Byron, Schiller (*Wallensteins Lager* and *Demetrius*), Goethe, Heine, Béranger, Victor

Hugo, and others. His works were published at St. Petersburg (1862-63).

MEIBOM, mi'bôm, VICTOR VON (1821-92). A German jurist, born at Cassel. He studied law at Marburg and Berlin, and was for several years assistant judge at tribunals of Rotenburg and Marburg. In 1858 he was appointed professor of German law at the University of Rostock, and from 1866 to 1873 held a similar appointment at Tübingen. He then went to Bonn, where he remained till 1875, when he became a member of the Supreme Court of the Empire in Leipzig. He retired in 1887. His chief work is *Das deutsche Pfandrecht* (1867), a thorough and historically reliable discussion of the laws and regulations relating to mortgage before the introduction of Roman law.

MEIDERICH, mi'dër-ik. An industrial town in the Rhine Province, Prussia, between the Emscher and the Ruhr, 15 miles northeast of Krefeld (Map: Germany, B 3). It contains the Rhine Steel Works, employing 4300 men, and a number of other iron and steel works, machine shops, phosphate works, saw mills, and brick-kilns. In the vicinity are extensive coal mines and saline springs. The trade in cattle is important. The industries date from 1850. Meiderich became a town in 1894 and was annexed to Duisburg in 1905. Pop., 1900, 33,684; 1910, 41,017.

MEIER, mi'ër, EDWARD DANIEL (1841-1914). An American mechanical engineer, born in St. Louis, where he graduated from Washington University in 1858. After spending four years at the Royal Polytechnic College at Hanover, Germany, he returned to the United States and enlisted in the 32d Pennsylvania Volunteers in 1863. After the battle of Gettysburg he served in the artillery and in the Engineer Corps, and finally became a lieutenant of cavalry. At the close of the war he entered the Rogers Locomotive Works at Paterson, N. J., in 1867 became superintendent of machinery of the Kansas Pacific Railroad, in 1870 chief engineer of the Illinois Patent Coke Company, and in 1872 constructing engineer of the Meier Iron Company. In 1884 he organized the Heine Safety Boiler Company of St. Louis, of which he was president at the time of his death; and he was also the head until 1908 of the American Diesel Engine Company. Meier served as president of the American Boiler Manufacturers' Association, of the Machinery and Metal Trades Association in 1908-14, and of the American Society of Mechanical Engineers in 1911.

MEIER, MORITZ HERMANN EDUARD (1796-1855). A German classical scholar, born at Glogau. When 24 years of age he became professor extraordinarius at the University of Greifswald, and in 1824 he was made professor ordinarius at Halle, where he remained until his death. Friedrich August Wolf, and especially Wolf's great pupil, August Boeckh, whose classic work on the public economy of Athens appeared in 1817, had a great influence on Meier. His own first important publication dealt with a question in the legal antiquities of Athens, *Historia Juris Attici de Bonis Damnatorum*, etc. (Berlin, 1819); but his greatest work was written in collaboration with G. F. Schoemann, *Der Attische Process* (Berlin, 1824), and was crowned by the Berlin Royal Academy. This treatise, now revised by J. H. Lipsius (Berlin, 1883-87), remains the standard work on Athenian legal procedure. Meier also prepared

an edition of Demosthenes, *Against Meidias*, and published many papers on subjects relating to classical antiquity, especially Andocides and Theophrastus; these were collected after his death in *Opuscula* (1861-63). Much of his energy, however, while resident at Halle, was spent on editorial duties, as he was an editor of the Halle *Allgemeine Zeitung* for many years, and also coeditor of the *Allgemeine Encyclopädie der Wissenschaften und Künste* from 1830 to 1855.

MEIGGS, mëgz, HENRY (1811-77). An American contractor. He was born at Catskill, N. Y., was engaged in the lumber business in 1835, and failed in the commercial crisis of 1837. It was not until the outbreak of the gold excitement in California that he again became prosperous. He then shipped lumber in large quantities to the Pacific coast, and his trade so increased that he was encouraged to build a large number of vessels. At length a financial stringency in the San Francisco money market drove him to borrowing, and eventually, his business collapsing, he fled to South America. He settled in Chile and entered into the business of bridge-building contractor. Later he devoted himself to railroad construction, and in Peru accomplished engineering works which are objects of general admiration. He made contracts for the construction of six railroads in that country, one of which, the Callao, Lima, and Oroya Railroad, over the Andes, ranks among the first public works of the kind in the world.

MEIGS, FORT. See FORT MEIGS.

MEIGS, CHARLES DELUCENA (1792-1869). An American physician. Born in St. George, Bermuda, he studied medicine at the University of Georgia, graduating in 1809, and later at the University of Pennsylvania (M.D., 1817). For a short time he practiced in Augusta, Ga., but in 1817 established himself in Philadelphia and soon gained recognition as an obstetrician. From 1841 to 1861 he held the chair of obstetrics and diseases of women and children at the Jefferson Medical College. In 1826 he assisted in founding the *North American Medical and Surgical Journal*, being one of the original editors. He contributed many articles to medical literature, and is the author of *The Philadelphia Practice of Midwifery* (1838; 2d ed., 1842); *Lectures on Some of the Distinctive Characteristics of the Female* (1847); *Females and their Diseases* (1848; 2d ed., as *Woman: Her Diseases and Remedies*, 1851; 3d ed., 1854); *Remarks on Spasmodic Cholera* (1849); *Obstetrics* (1849; 3d ed., 1856); *Observations on Certain Diseases of Children* (1850); *Treatise on Acute and Chronic Diseases of the Neck of the Uterus* (1854); *On the Nature, Signs, and Treatment of Childbed Fevers* (1854). He translated Hufeland, *A Treatise on the Scrofulous Disease* (1829); Velpeau, *An Elementary Treatise on Midwifery* (1831); Colombat de L'Isère, *A Treatise on the Diseases and Special Hygiene of Females* (1845). Consult College of Physicians, Philadelphia, *Transactions*, N. S., vol. iv, pp. 417-448 (Philadelphia, 1872); John F. Meigs, *Memoir of Charles D. Meigs* (ib., 1872).

MEIGS, MONTGOMERY CUNNINGHAM (1816-92). An American soldier and military engineer. He was born in Augusta, Ga., studied for a short time at the University of Pennsylvania, graduated at West Point in 1836, and immediately afterward became second lieutenant in an artillery company. In 1837 he was trans-

ferred to the Corps of Engineers, in which he became a lieutenant in 1838 and captain in 1853. From 1836 to 1852 he was employed by the War Department on various important engineering works. Between 1852 and 1860 he superintended the construction of the Potomac Aqueduct from the Great Falls in Maryland to Washington, D. C., the erection of the Capitol extension in Washington, the Post Office extension, and the great iron dome of the Capitol. In the winter of 1860-61 he was engaged in placing Fort Jefferson, Fla., in a condition for defense, and in April, 1861, organized and conducted the Fort Pickens relief expedition. On May 15 he was appointed Quartermaster-General of the United States army, with the rank of brigadier general. In this important position he had the direction of the supply and equipment of the United States forces in the field during the continuance of the war. Though generally stationed at Washington, he frequently made personal inspections of the quartermaster's departments of the various armies during siege and field operations. On July 5, 1864, he was brevetted major general for "distinguished and meritorious services during the Rebellion." After the war until his retirement in 1882 he was a member of many important boards and commissions in connection with the War Department. After his retirement until 1887 he was employed as architect on the construction of the United States Pension Bureau Building in Washington. The historian Rhodes has grouped him with Stanton, Dana, and Fry, who, he says, "may challenge comparison with any administrators for honesty and efficiency."

MEIGS, RETURN JONATHAN (1734-1823). An American soldier and pioneer, born in Middletown, Conn. He joined the Continental troops before Boston shortly after the battle of Lexington, and later in the same year, as a major of militia, accompanied Benedict Arnold on the latter's expedition against Quebec. During the assault on that city he was made prisoner, but was exchanged the following year. He became a colonel in 1777, defeating in May of that year the British at Sag Harbor, L. I.; he also participated in Anthony Wayne's storming of Stony Point in 1779. After the close of the war he became interested in schemes of Western colonization, was one of the promoters of the Ohio Company, and crossed the Alleghanies himself in 1788 to settle at Marietta, Ohio. Later he was interested in the Muskingum settlement, and is said to have devised for emigrants a code of rules which was fastened to a tree at the junction of the Ohio and Muskingum rivers. In 1794 he was commissary general of the troops in General Wayne's expedition against the Indians, and distinguished himself at the battle of Fallen Timbers. In 1801 he was appointed Indian agent, and took charge of the Cherokee agency in Georgia, where he remained until his death. His *Journal of the Expedition to Quebec*, first printed in the *American Remembrancer*, was published in 1864.

MEIGS, RETURN JONATHAN (1765-1825). An American politician, born in Middletown, Conn., son of Return Jonathan Meigs, the elder. He graduated at Yale in 1785 and studied law. In 1788 he removed with his father to Ohio Territory, and from 1803 to 1804 was Chief Justice of the State. He was judge of the United States Court for Michigan Territory in 1807 and 1808; served as Democratic United States Senator

from Ohio in 1808-10; and from 1810 to 1814 was Governor of Ohio. His services during the War of 1812 were particularly efficient in organizing militia and supplying garrisons to the forts. In 1814 he was appointed Postmaster-General by President Madison, and he was continued in this office until 1823 by President Monroe.

MEIJI TENNO, mā'ē-jē tēn'nō (1852-1912). The posthumous name of an emperor of Japan; during life he was known in Europe and America as Mutsuhito (gentleman), but in Japan he was called by the common people Tenshi Sama (august son of heaven) and by the educated class Shu-jo (supreme master). He was born Nov. 3, 1852, in the mountains of Kyoto, and was the one hundred and twenty-first of his line. His education, liberal as measured by the standards of the time, was supervised by his mother, who had been a lady of the Imperial household. He succeeded his father, Osahito, in 1867, but was not crowned (at Osaka) until Oct. 31, 1868. Immediately, in order to carry out a purpose of concentrating power in the hands of the Emperor himself, the capital was moved from Kyoto to Yeddo, and the city renamed Tokyo. The next year Mutsuhito returned to Kyoto and took as his consort Haruko (died 1914), a princess of the house of Ichijo. During a reign of 45 years he did much to promote the progress of his country, his biography being merged in the history of the New Japan. Largely through his exertions Japan was freed from the restraints of centuries and took her place among the great powers of the world, after triumphing over China and Russia. The Emperor was the first constitutional monarch in the Far East; as an administrator he is generally held to have been very successful, although opinions differ as to his activity in later years. He followed a policy of trusting state affairs in large measure to such loyal advisers as Iwakura, Kido, Okubo, and Ito. A lover of books and the collector of a large library of Japanese and Chinese classics, he was also one of the notable writers of verse of his time and country. It is said that he composed 38,000 poems of five lines or *tanka*. He died July 29, 1912, and was succeeded by his son Yoshihito (q.v.). For an account of the events of his reign, see JAPAN, *History*. Consult J. H. Longford, *The Evolution of New Japan* (New York, 1913), and the bibliography under JAPAN.

MEIKLEJOHN, mik'l-jōn, ALEXANDER (1872-). An American college president. He was born at Rochdale, Eng.; came to America in 1880; and was educated at Brown University (A.B., 1893; A.M., 1895) and at Cornell (Ph.D., 1897). In the latter year he returned to Brown as a member of the department of philosophy—instructor (1897-99), assistant professor (1899-1903), and associate professor (1903-06). From 1906 to 1912 he was professor of logic and metaphysics and from 1901 to 1912 he was dean. In 1912 he was called to the presidency of Amherst College.

MEIKTILA, mik-tē'lā. A division of south-east Upper Burma, comprising the districts of Meiktila, Kyauske, Myingyan, and Yamethin (Map: Burma, C 2). Area, 10,852 square miles. Pop., 1901, 992,807; 1911, 1,170,502. Capital, Meiktila.

MEILHAC, mā'yāk', HENRI (1831-97). A French dramatist, who worked chiefly in collaboration with Ludovic Halévy (q.v.). He was born Feb. 23, 1831, in Paris, where he studied

at the Lycée Louis-le-Grand. From working in a book shop he turned to writing for the stage. *Satania* and *Garde-toi, je me garde* pleased the critics, who discerned Meilhac's cleverness and technical knowledge. He succeeded not only in vaudeville, but in higher and more delicate comedy. It is, however, impossible to tell what belongs to Meilhac and what to Halévy, so well did these two men blend their genius. Meilhac and Halévy excelled in operetta and opera bouffe, as well as in more dramatic, less musical composition. Together they wrote *Frou-frou*, and the librettos of *La belle Héloène* and *La grande duchesse* for Offenbach's music. Of Meilhac's work before 1861 *La vertu de Célémène* is most significant; of that after 1881, *Décoré* (1888) and *Grasse fortune* (1896). He was made a member of the French Academy in 1888 and died in Paris, July 6, 1897.

MEILI, mē'lē, FRIEDRICH (1848-1914). A Swiss authority on international law, born at Hinwil, Canton of Zurich. He was educated at the universities of Zurich, Leipzig, and Berlin and at the Ecole de Droit de Paris; practiced law from 1871 to 1895; and became docent (1880), professor extraordinary (1885), and regular professor (1890) of private international law in the University of Zurich. He retired in 1913. He was one of the jurists who made awards in the Swiss national railway cases, including the St. Gotthard railway (1910), and one of the three arbitrators in the Lourenço Marques railway case between Portugal and Great Britain (1900); was employed by the Russian Imperial government in the Hillfeld case on the pawning of Russian titles in Berlin and by the Austrian ministry of commerce in planning a new patent code; and represented Switzerland in The Hague conferences on private international law (1893, 1894, 1900, and 1904). Among his important works, dealing particularly with the law of transportation, are: *Das Telegraphenrecht* (2d ed., 1873); *Das internationale Zivil- und Handels-Recht* (2 vols., 1902; in English, 1905); *Das internationale Zivilprozessrecht* (1904-06); *Die Kodifikation des Automobilrechts* (1907); *Die drahtlose Telegraphie* (1908); *Privat- und Zivil-Prozessrecht auf Grund der Haager Konventionen* (1911), with Mamelik.

MEILLET, mā'yā', ANTOINE (1866-). A distinguished French philologist, born at Moulins-sur-Allier and educated at the universities of Paris and Vienna. He was maître de conférences at the Paris Ecole des Hautes Etudes in 1891 and became professor of Armenian at the School of Oriental Languages in 1903. In 1906 he was elected to the chair of Slavic in the Collège de France. For his linguistic work he received an honorary degree from the University of Berlin, and was elected corresponding member of a number of academies, among them that of St. Petersburg. He published: *Recherches sur l'emploi du génitif-accusatif du vieux slave* (1897); *Grammaire comparée de l'arménien* (1903); *Introduction à l'étude comparative des langues indo-européennes* (1903; 3d ed., 1912; Ger. trans., 1909, by Printz); *Dialectes indo-européens* (1908), in which, like Kretschmer, he attempts to trace the Indo-European subfamilies back to early dialectical differences; *Aperçu d'une histoire de la langue grecque* (1913), a brilliant work of revolutionary character, which restores the written language to its position of paramount importance; *Altarmenisches Elemen-*

tarbuch (1913); and studies of old Slavic. In 1902 a volume of *Mélanges linguistiques*, made up of contributions by his numerous pupils, was prepared in his honor.

MEILLEUR, mā'yēr', JEAN BAPTISTE (1795-1878). A Canadian author and educator. He was born at St. Laurent, near Montreal, Province of Quebec, and was educated at the College of St. Sulpice, Montreal. He studied law, but left it for the medical profession and in 1825 graduated at the Carleton Medical College in Vermont. He returned to Lower Canada, did editorial work for the *Tessier Journal*, and in 1834 was elected a member of the Lower Canada Legislative Assembly. He was appointed Superintendent of Public Instruction by Sir Charles Bagot in 1842, and held that position for 15 years, during which time 45 educational institutions were established, largely through his efforts. In 1862 he was appointed postmaster of Montreal. He was one of the founders of L'Assomption College. He published in French several textbooks on chemistry, grammar, and education.

MEINEKE, mī'ne-ke, JOHANN ALBRECHT FRIEDRICH AUGUST (1790-1870). A distinguished German classical scholar. He was born at Soest in Westphalia and was educated at Leipzig, especially under G. Hermann. He was director of the Gymnasium at Danzig (1817-26) and of the Joachimsthal Gymnasium at Berlin (1826-57). His many works, chiefly critical editions of the Greek authors, include: *Fragmenta Comicorum Græcorum*, three volumes, with an introductory volume giving a "Critical History of the Greek Comic Poets" (1839-43; a fifth volume came in 1857); *Analecta Alexandrina* (1843), containing collections and admirable explanations of the fragments of Euphorion, Rhianos, Alexander Aetolus, and others; and text recensions of Strabo (1852-53); of Horace (1834), in which the so-called four-line strophe law, discovered by Meineke and Lachmann, is applied; of Stobæus (1855-64); of Athenæus (1859); and of Aristophanes (1860). Consult: F. Ranke, *Albert Meineke* (Leipzig, 1871); H. Sauppe, *Zur Erinnerung an Meineke und Bekker* (Göttingen, 1872); E. Förstemann, in *Allgemeine deutsche Biographie*, vol. xxi (Leipzig, 1885); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

MEINHOF, mīn'hōf, CARL (FRIEDRICH MICHAEL) (c.1857-). A German philologist, noted for his knowledge of African languages. He was born in Barzwitz, Pomerania, the son of a clergyman; was educated at Halle, Erlangen, and Greifswald; in 1879-86 was a school-teacher in Wolgast and Stettin; and then became pastor at Zizow in Pomerania. In 1902-03 he traveled in Africa to make linguistic studies. He then taught African languages in the Berlin Seminary for Oriental languages until 1909, when he was made professor of the same subject in the Hamburg Colonial Institute. Meinhof edited the *Abhandlungen* of this institute and the *Zeitschrift für Kolonialsprachen*. Among his valuable works are: *Grundriss einer Lautlehre der Bantusprachen* (1899; 2d ed., 1910); *Grundzüge einer vergleichenden Grammatik der Bantusprachen* (1906); *Deutsche Kolonialsprachen: Herero, Swahili, und Duala* (1909-12); *Die Sprachen des dunkeln Weltteils* (1909); *Lehrbuch der Namasprache* (1909); *Moderne Sprachforschung in Afrika* (1910);

Dichtung der Afrikaner (1911); *Afrikanische Religionen* (1912); *Die Sprache der Hamiten* (1912). *An Introduction to the Study of African Languages*, translated by A. Werner, appeared in 1915.

MEINHOLD, mīn'hōlt, JOHANNES (1861-). A German Old Testament scholar. He was born in Kammin; studied theology in Leipzig, Berlin, Greifswald, and Tübingen; taught at Greifswald (1888) and after 1889 at Bonn, where he became professor of Old Testament exegesis and Hebrew in 1903. Among his published works are: *Komposition des Buches Daniel* (1884); *Beiträge zur Erklärung des Buches Daniel* (1888); *Die geschichtlichen Hagiographen und das Buch Daniel* (1889), with Ottli; *Jesus und das alte Testament* (1896); *Jesaja und seine Zeit* (1898); *Die Lade Jahves* (1900-01); *Biblische Urgeschichte* (1904); *Sabbat und Woche* (1905); *Weisheit Israels* (1908); *Sabbat und Sonntag* (1909); *Der Mischnatraktat Ioma* (1913).

MEININGEN, mī'ning-en. The capital of the little Duchy of Saxe-Meiningen, Germany, 40 miles south of Eisenach, on the right bank of the Werra (Map: Germany, D 3). Since a fire in 1874 it has been largely rebuilt on a modern plan, but there still remain the eleventh-century parish church and the seventeenth-century ducal palace, now the home of the Henneberg Antiquarian Society. Its collections include coins, paintings, and a library of 50,000 volumes. Modern buildings include two ducal palaces and a town hall. It has manufactures of machinery, toys, books, and there are railway shops. The Meiningen stock company, which for 16 years enjoyed a European reputation for the excellence of its staging and acting, was dissolved in 1890. Pop., 1910, 17,131.

MEINONG, mīn'ōng, ALEXIUS, KNIGHT VON HANDSCHUCHSHEIM (1853-). An Austrian psychologist and philosopher, born in Lemberg and educated in Vienna under Brentano. From Vienna he went in 1882 as professor to the University of Graz, where he established in 1894 the first psychological institute in Austria. Among his important publications are: *Hume-Studien* (1877-82), devoted especially to Hume's nominalism, and supplemented by many articles in periodicals; *Ueber philosophische Wissenschaft und ihre Propädeutik* (1885); *Psychologisch-ethische Untersuchung zur Werththeorie* (1894)—like Ehrenfels basing a theory of value on psychological grounds; *Ueber Annahmen* (1902; 2d ed., 1910), in which he frames a sort of transcendental realism with a "Gegenstandstheorie" of ideal objects or objects of a higher order; *Ueber die Stellung der Gegenstandstheorie im System der Wissenschaften* (1907); *Gesammelte Abhandlungen* (3 vols., 1913-14). For his psychological interpretation of Weber's Law, see WEBER'S LAW. Consult the excellent article on Meinong in Eisler's *Philosophen-Lexikon* (Berlin, 1912).

MEISSEN, mī'sen. An old town of the Kingdom of Saxony, Germany, on both sides of the Elbe, 16 miles by rail northwest of Dresden (Map: Germany, E 3). The old town is situated on the left bank opposite the more modern quarters on the right bank. Above it rises the Schlossberg (160 feet), with the cathedral and the Albrechtsburg. The cathedral, a masterpiece of Gothic architecture, was erected in 1260-1450. It is surmounted by a fine spire of open-work, contains many monuments and tombs of

Saxon rulers, and a notable altarpiece by an unknown German painter. There are numerous other old churches. The Albrechtsburg, an excellent late Gothic castle, erected in 1471-83 and occupied by the royal porcelain factory from 1710 to 1864, has been restored since 1873, and some of the halls have been decorated with fine frescoes by modern artists. The most noteworthy educational institution is the Fürstenschule on the Ahrberg, founded in 1543. Lessing and Gellert attended school here. There are also a fifteenth-century council hall, a Realschule, and schools of commerce, agriculture, and navigation.

Meissen has played a prominent part in the porcelain industry of Saxony. It was here that Böttger established in 1710 the first porcelain factory in Europe and produced the famous Meissen ware. (See BÖTTGER; POTTERY.) The factory was transferred in 1863 from the Albrechtsburg to Triebischthal, a short distance from Meissen, and now employs over 700 persons. Meissen has a number of other porcelain manufactories, also foundries and machine works, and manufactures of stoves, gunny, tin goods, shoes, lamps, chemicals, sugar, bricks, sewing machines, pianos, and furniture. There are large granite quarries and vineyards. The chief articles of commerce are local manufactures and wine.

Meissen was founded in 928 by the Emperor Henry I, and rose to great importance as the residence of the margraves of Meissen, the direct ancestors of the present royal house of Saxony. The bishops of Meissen had until 1581 the rank of princes of the Empire. Pop., 1900 (including Cölln, annexed in 1901), 20,123; 1910, 33,884, chiefly Protestants.

MEISSEN, HEINRICH VON. A German minesinger. See FRAUENLOB.

MEISSNER, mīs'nēr, ALFRED (1822-85). An Austrian poet, born at Teplitz, grandson of the following. His *Gedichte* (1845; 12th ed., 1880) attracted much attention, and the lyrical epic *Ziska* (1846; 2d ed., 1884) shows the influence of Byron, George Sand, and Lenau. During a stay in Paris he wrote his *Revolutionäre Studien aus Paris* (1849). His tragedies, *Das Weib des Urias* (1850) and *Reginald Armstrong, oder die Welt des Geldes* (1853), were not very successful. Better are his novels, chief among which are: *Sansara* (1861); *Neuer Adel* (1861); *Zur Ehre Gottes*. The last named is an interesting narrative of the events which took place in Austria during the reactionary period of 1850-54. His *Heine-Erinnerungen* (Hamburg, 1856) is also important. Consult his autobiography, *Geschichte meines Lebens* (Teschen, 1884), and Ernst Ziel, *Litterarische Reliefs* (Leipzig, 1895).

MEISSNER, AUGUST GOTTLIEB (1753-1807). A German miscellaneous writer, born at Bautzen. He studied law at Wittenberg and Leipzig, and in 1785 was appointed to the chair of belles-lettres in the University of Prague. For the last two years of his life he was director of the Fulda Gymnasium. Best known of his works are his *Skizzen*, a collection of miscellaneous stories, dialogues, anecdotes, and essays. He also wrote several historical novels, such as *Alcibiades* (1781-88); *Bianca Capello* (1785); *Epaminondas* (1798). His complete works were published in fifty-six volumes (Vienna, 1811-12). Consult R. First, *A. G. Meissners Leben und Schriften* (Stuttgart, 1894).

MEISSONIER, mā'sōnyá', JEAN LOUIS ERNEST (1815-91). A French military and genre

JEAN ERNEST MEISSONIER

"FRIEDLAND, 1807," FROM THE PAINTING IN THE METROPOLITAN MUSEUM, NEW YORK

painter. He was born at Lyons, Feb. 21, 1815. In 1830 he went to Paris and worked for a short time in the studio of Cogniet, but he received his most valuable training in art from his study of the old masters in the Louvre, especially those of the Dutch school. At first he illustrated books and made etchings as a means of livelihood. His first painting, "The Visitors," was exhibited at the Salon in 1834. In 1843 and 1848 he received first-class medals from the Salon, and in the expositions of 1855, 1867, and 1878 the Grand Medal of Honor. In 1848 he was captain of artillery in the National Guard. He was with Napoleon III at Solferino in 1859, and during the siege of Paris in 1870 he was lieutenant colonel of infantry in the National Guard. He received the cross of the Legion of Honor in 1846 and the Grand Cross in 1889; was chosen a member of the Institute of France in 1861 and president in 1876 and 1891. He died in Paris, Jan. 31, 1891.

His subjects are historical, military, and scenes from everyday life. Most of his pictures are on small canvases and studies of one or two figures. The characters are almost entirely men; in very few of his pictures do women or children appear. He was the chief of a school of genre painters, among the most prominent of whom were his son, Jean Charles, Detaille (q.v.), and Vibert (q.v.). Every detail is as faithfully and carefully studied and portrayed as if it were of sole importance, and sometimes, particularly in his larger pictures, to the detriment of the general effect. His drawing is masterly, the color is fresh and true, and the light and shade excellent; but his paintings usually lack beauty of tone, and their bald realism precludes real inspiration. He excels in the portrayal of action, and in his power to depict the subtle shades of expression on the faces of his characters. Of his military pictures one of the most famous is "Friedland, 1807" (1875), a large painting in the Metropolitan Museum, New York. Other famous military pictures are: "Cavalry Charge" (1867); "Napoleon III at Solferino" (1864), in the Louvre; "The Retreat from Moscow"; "Napoleon Overlooking a Battle"; "Napoleon and his Staff in 1814" (1864, Louvre). The Metropolitan Museum of Art, New York (inclusive of the Vanderbilt collection), possesses 12 other paintings by Meissonier and he is excellently represented in the Louvre and in the Wallace collection, London. Among his best-known genre pictures are: "The Quarrel" (1855), belonging to the King of England; "Ball Players at Antibes"; "Amateurs of Painting" (1843, Musée Condé, Chantilly); "The Halt" (1869); "The Chess Players" (1834); "Throwing Dice" (1836); "Man Reading," "Man at a Window," and "The Voyage" (Louvre); "The Farrier" (1861); "The Barricade." He also designed for lithography and was an etcher of note. For his biography, consult: Jules Claretie (Paris, 1884); Larroumet (ib., 1893); Gréard (ib., 1897); Fromentin (ib., 1901); Robinson, in the *Art Annual* (London, 1887); in *Masters in Art*, vol. v (Boston, 1904).

MEISSONIER, JUSTE AURÉLE (1695-1750). A French decorative designer and goldsmith whose work was unexcelled for originality and in style constitutes the best and most complete definition of rococo. (See INTERIOR DECORATION.) He was appointed by Louis XV to a court position of draftsman, and he published many illustrated

books on ornament, engraved mostly by Huquier. Some of his designs are accessible in T. A. Strange, *French Interiors, Furniture, etc.* (London, 1907).

MEISTER, mī'stēr, RICHARD (1848-1912). A German classical scholar, born in Dresden, where his father was regisseur at the Court Theatre. He was educated at Leipzig (under Curtius, Ritschl, and Overbeck) and at Berlin. In 1872 he became a teacher in the Leipzig Nikolaischule, of which he was Konrektor for the last 12 years of his life. In the fourth volume of Curtius' *Studien zur griechischen und lateinischen Grammatik* (1871) appeared Meister's work on the dialect of Heraclea. He revised Ahrens's *De Græcæ Linguae Dialectis* (1839-43) in two volumes as *Die griechischen Dialekte* (1882-89), which was supplemented by *Zum eleischen, arkadischen, und kyprischen Dialekte* (1890) and by his "Beiträge zur griechischen Epigraphik und Dialektologie," in *Berichte der kgl. sächs. Gesellschaft der Wiss.* (1899-1911).

MEISTERSINGER, mī'stēr-sing-ēr. The name given to those poets and poetasters who, succeeding the minnesingers (q.v.), gradually deteriorated into very inferior rhymesters, who organized themselves into schools according to trade guilds and who produced an immense number of master songs, almost wholly doggerel. Hans Sachs (q.v.) was the best of them all. The word "meister" (derived, like English "master," from Latin *magister*) means a poet who has studied, as all laymen did, in Church schools. Accordingly the meistersingers were distinguished from the common minstrels. They also formed a guild or caste. The meistersingers were wont to trace their origin back to "the 12 old masters." Various legends arose, explanatory of their origin. One Spangenberg even thought Moses was a meistersinger. David, also, was looked upon as a patron in whose time hundreds of meisters were supposed to have taught 4000 scholars, and Solomon also was reckoned in. Furthermore, the minnesingers were reckoned as members of their caste, but, as a matter of fact, they were different in many ways. Individual meistersingers out of modesty called themselves "lovers of art" (*Liebhaber der Kunst*), and the whole body of them named themselves the "honorable" or "praiseworthy society." We may suppose that associations existed as early as 1200. Heinrich von Meissen, called Frauenlob, may have had a school of song at Mainz. We cannot be sure of a regular school till 1450 in Augsburg. But the meistersgesang had flourished in the fourteenth century at Mainz, Strassburg, Colmar, and Frankfurt; in the fifteenth and sixteenth at Nuremberg; later still it flourished in Breslau, Görlitz, and Danzig. In 1492 Strassburg had the first school founded by written statutes, and Nuremberg had what became, thanks to Richard Wagner, best known to this generation. The last school died out at Memmingen in 1844.

Each school had for the head meistersinger a chair called der *Künste Stuhl* (chair of the arts), or, as in Nuremberg, the *Meisterstuhl* (master's chair). In England this was called "the bard's seat." Later the singer seems simply to have stood in the midst of his hearers. To enter the guild a candidate had to pass an examination before four markers, usually in a church. He must devise some new arrangement or a new melody (*Weise*) without infringing any rule. One of the markers determined

whether the theme was right, another whether the versification was right, and the others looked to rhyme and melody. One need hardly add that, in a school whose whole attention was given to technicalities, the possible mistakes were limited by set rules. The success of a meistersong hung upon its conformity with these rules. Indeed, the very essence became a formula or a series of formulas. The *Tabulatur*, or tablature, a term borrowed from music and not found among the earliest documents, signified, in musical nomenclature, a bit of music written not with notes, but with letters or figures, designed to initiate the student into vocal or instrumental music. But as a code for the meistersingers it had to be mastered by whoever wished to be of the guild. In order to teach scholars more easily the content of the code, it was drawn up in short poems. In fine, it was a book of rules, the text book of the meistersong. This *Tabulatur* dealt with three matters: (1) the kinds of poems and the parts of a meistersong; (2) permissible rhymes; (3) the mistakes, which are the main business, and have to do (a) with errors of delivery, of melody, of structure, and of opinion and (b) chiefly, however, with errors of rhyme or mangling of words or cacophony.

The school had inside and outside members, called by divers names. Those who were still studying the *Tabulatur* were called *Schüler*; those who had mastered it, *Schulfreunde*; those who could correctly sing the songs of others, *Singer*; those who could write new words to a tune already accepted as correct, *Dichter*; and those who had both written and composed a new and original song true to the *Tabulatur* were *Meister*. Meetings were held on festivals, chiefly on Sunday after service and in the church. Very often the singers met in the town hall or at an inn. Prizes were awarded, and those who sang ill were fined. The prize was sometimes money, sometimes a crown, as at Nuremberg in the time of Hans Sachs. Flowers had also an important part in these competitions. Often in the older days one singer would hang up a wreath as a challenge and as a reward for victory. Finally may be mentioned the fact that the meistersinger often wore a costume which was not seldom motley and which was often sumptuous.

The various songs were divided into three strophes, and each strophe was divided into two *Stollen*, alike in metrical structure, and a *disant* or *Abgesang*. Plate gives a long list of the various features of rhythm and rhyme in this complicated poetry, in all of which we observe a singular likeness to the technicalities invented or slavishly aped by the lesser, and indeed often enough by the better, poets two centuries earlier in southern France. The best feature of the meistersinger's art was that it throve among the humbler folk, refined them, gave them a sense of nationality, opened the way for the artistic treatment of better themes, and spread widely the love of artistic music among those who needed most a sense of form.

Nagel, *Studien zur Geschichte der Meistersänger* (Langensalza, 1909).

MEISTERSINGER VON NÜRNBERG, nurn'bërk, DIE. A musical comedy in three acts by Richard Wagner; first produced in Munich, June 21, 1868; in the United States, Jan. 4, 1886 (New York). It is a faithful and historically accurate picture of the meistersinger's art. See MEISTERSINGER.

MEITZEN, mits'en, AUGUST (1822-1910). A German statistician and political economist, born in Breslau and educated at Heidelberg and Tübingen. He was a prominent member of the Statistical Bureau and in 1892 was made honorary professor of the science of statistics and of political economy at the University of Berlin. His contributions to the science of statistics include *Die internationale land- und forstwirtschaftliche Statistik* (1873) and *Geschichte, Theorie und Technik der Statistik* (2d ed., 1903); he also wrote *Die Mitverantwortlichkeit der Gebildeten für das Wohl der arbeitenden Klassen* (1876) and *Siedelung und Agrarwesen der Westgermanen und Ostgermanen*, etc. (1896).

MEJERDA, me-jër'dë, or **MEJIRDA**, me-jir'dë. A river of north Africa. It rises in the Great Atlas Mountains in eastern Algeria and, after an easterly and northeasterly course of over 200 miles, mainly through Tunis, flows into the Gulf of Tunis on the Mediterranean, 24 miles north of the capital. It was the ancient Bagradas, with its mouth at Utica, now Bu-Chateur, 7 miles to the south.

MEJÍA, mã-hë'a, TOMÁS (c.1812-67). A Mexican general, an Indian by race. He took a prominent part in the war with the United States and served with Miramón (q.v.) and Zuloaga against Juárez in 1858 and 1859. On the occasion of the French intervention he did good service on the Imperialist side. He was present at the siege of Querétaro in 1867, was captured with other officers in Maximilian's army, and was with them court-martialed and shot. See MAXIMILIAN.

MEJIR'DA. A river of north Africa. See MEJERDA.

MEKHITARISTS, or **MECHITARISTS**, mēk'i-tār-ists. A congregation of Armenian Christians who reside on the island of San Lazzaro at Venice, but have also obtained a footing in France, Austria, Turkey, Russia, and elsewhere. They derive their name from Mekhitar or Mechitar (i.e., the Comforter) da Petro (born 1676, died 1749), who in 1701 founded at Constantinople a religious society for the purpose of introducing Western culture among the Armenians. He had already become a Catholic and soon had to flee. In 1702 he founded a convent at Modon in the Morea, then under the rule of Venice. Pope Clement XI in 1712 confirmed the congregation, gave it the Benedictine rule, and made Mekhitar its abbot. The war between Turkey and Venice compelled its transference in

1715 to Venice, where, on the island of San Lazzaro, the Mekhitarists held a convention in 1717. In 1773 a split in the congregation occurred, and a branch is now established in Vienna. The Mekhitarists acknowledge the supremacy of the Roman pontiff. The most useful occupation of the Venetian branch is printing the classic writings of Armenian literature, including an Armenian translation of the Bible (1734); their editions are universally admitted to be the best and most correct. They also issue a journal, which is much read throughout the Levant. Those in Vienna conduct a German bookstore. For the history of those at Venice, consult Boré, *Le couvent de Saint Lazare à Venise, ou histoire succinte de l'ordre des Méchitaristes arméniens* (Paris, 1837) and *Méchitaristes arméniens de Venise* (ib., 1869); for those at Vienna, consult Scherer, *Die Mechitaristen in Wien* (5th ed., Vienna, 1892); for the life of the founder, consult *Le vie du serviteur de Dieu Mechitar* (Venice, 1901).

MEKLONG, mā'klōng'. An important port on the south coast of Siam at the mouth of the Meklong River, 40 miles southwest of Bangkok (Map: Siam, C 4). The population is about 10,000, consisting chiefly of Chinese merchants and Siamese fishermen.

MEK'NEZ. A city in Morocco. See MEQUINEZ.

MEKONG, mā-kōng', or **CAMBO'DIA**. The largest river of Indo-China. Its ultimate source has not been ascertained, but it is supposed to rise in the mountains of central Tibet, not far from the sources of the Yang-tse-kiang (Map: French Indo-China, E 4). It flows in a generally southeasterly direction, first through Tibet and China proper, where it is generally called Lantsang, and then through Indo-China, where it forms at first the boundary between Burma and Tongking, then between Annam and Siam. Its lower course is through Cambodia and Cochinchina. The course of the Mekong after it enters Indo-China becomes very crooked and interrupted by rapids and falls, which prevent the use of this great river as a waterway. It is only for the insignificant part of its length below Khong, a town in the southeast corner of Siam, that the river becomes navigable. Here its flow becomes less turbulent as it enters its great alluvial plain. Finally it divides into a number of arms, forming a marshy delta which occupies almost the whole of Cochinchina and through which the Mekong enters the China Sea after a total flow of about 2800 miles. At the town of Pnom Ponk in Cambodia an arm extends northwestward from the Mekong to the large lake Tonle Sap, which at one time discharges into the Mekong and at another is fed by it.

MELA, POMPONIUS. A Latin writer, the first to compose a strictly geographical work. He was a native of Spain and is believed to have lived in the time of the Emperor Claudius, but nothing whatever is known concerning him. Mela's compendium of geography is a brief work, in three books, and is entitled *De Situ Orbis*. The text is greatly corrupted, on account of the abundance of proper names; but the style is good, and the author shows a very creditable diligence in research and discrimination in the use of his authorities. The work is valuable too because this book and the geographical parts of the *Historia Naturalis* of Pliny are the only formal treatises on geography known to us from classical times. The editio princeps appeared

at Milan in 1471, and there is an early translation by Arthur Golding (London, 1585). There are good editions by Tzschuche (Leipzig, 1807), Parthey (Berlin, 1867), and Frick (Leipzig, 1880). Consult: E. H. Bunbury, *Ancient Geography*, vol. ii (London, 1879); W. S. Teuffel, *Geschichte der römischen Litteratur*, vol. ii (6th ed., Leipzig, 1909); M. Schanz, *Geschichte der römischen Litteratur*, vol. ii, part ii (3d ed., Munich, 1913).

MEL'ALEU'CA. A genus of plants. See CAJAPUT.

MELAM'PUS (Lat., from Gk. Μελάμπους, *Melampous*, Blackfoot, from Gk. μέλας, black + πούς, foot. Tradition said Melampus' foot was deeply burned by the sun when he was a boy). In Greek legend, the son of Amythaon; his mother is said by different authors to be Aglaia, Rhodope, or Eidomene. He is represented as a physician and prophet. Since two serpents, whose lives he had saved, licked his ears while he slept, he had power to understand the language of birds and beasts. He is said to have acquired his powers of divination from Apollo, who imparted to him all the secrets of the art of medicine, and he was said to have discovered the herb melampodium, a kind of hellebore (q.v.). Melampus appears in two groups of legends. In one he and his brother Bias came from Thessaly to Pylus, where Bias fell in love with Pero, daughter of Neleus. Her father, however, required her suitor to bring to him the herds of Iphiclus, a Thessalian prince. Melampus went on this mission, was seized and thrown into prison, but overheard the worms in the beams predict the speedy fall of the building. He told his jailers, who believed, and with him escaped before the fall. The King, hearing of his gifts, secured his aid in curing a disease of his son, of long standing, and as his fee gave him the much desired cattle. He was also said to have left Neleus and to have gone to Argos, where he cured the Argive women, or, according to others, the daughters of King Pretus, of madness sent by Dionysus or Hera. As a reward he received for himself the hand of one of the daughters, Iphianassa, and a third of the land of Argos and another third for Bias. Thus their descendants, including the prophet Amphiaraus, ruled along with the descendants of Pretus. At Ægosthena in Megaris Melampus was worshiped as a god, having a temple and apparently games in his honor.

MELANCHOLIA, mēl'an-kō'li-ä (Lat., from Gk. μελαγχολία, black bile, from μέλας, *melas*, black + χολή, *cholē*, bile). A form of insanity characterized by depression, a painful emotional state, intellectual enfeeblement, weakened attention, and abulia. The melancholiac is gloomy, full of forebodings and fearful anticipations, convinced of physical inferiority and of moral worthlessness, and often contemplates, even if he does not commit, suicide. See MANIC-DEPRESSIVE INSANITY; INSANITY.

Involutional Melancholia. An insanity of the involutional period of life, characterized by great emotional depression, apprehension, and painful anxiety. It occurs in women between 40 and 50 years of age, in men after 50. Many show senile changes, especially arteriosclerosis. The menopause seems to be an etiological factor in woman. The exciting cause is often emotional shock or prolonged mental strain. Heredity has little influence. After months of headache, pressure, vertigo, insomnia, mental weakness,

neurasthenia, the patient is plunged into a deep apprehensive depression, and, tortured by delusions of sin, cowering with fear, she passes into a condition of very painful anxiety. She may be diverted at times, in cases where apprehension is slight and consciousness is unclouded, orientation being preserved; but in most cases agitation is shown by groaning, wringing the hands, and repeated appeals to God for help. Rare cases become mute, inactive, and resistive, refusing to eat, and quite negativistic, because of controlling delusions and hallucinations, rarely because of retardation. There may be hypochondriacal delusions, delusions of sinfulness, of persecution, of poverty, of unworthiness, or of possession; nihilistic ideas, or ideas of grandeur. The last are unfavorable symptoms.

Hydrotherapy best controls the wasting agitation. Constant watchfulness, day and night, is essential, the insomnia must be relieved, and nutrition must be sustained. The possibility of suicide must always be borne in mind. Usually three years elapse before the recoverable cases begin to improve. See INSANITY.

MELANCHTHON, mè-länk'thon, Ger. pron. mà-länk'tón, PHILIPP (1497-1560). The associate of Luther in the Protestant Reformation and the foremost teacher of his time; in the words of Hallam, "far above all others the founder of general learning throughout Europe." He sprang from the middle class, as did Luther from the lower. His father was an armorer in favor at court, his mother the daughter of the burgomaster of Bretten in Baden, where he was born Feb. 6, 1497. By the advice of his grand-uncle, the learned Reuchlin, he changed his family name, when he entered the University of Heidelberg at the age of 12, from Schwarzerd (Black Earth) into its Greek equivalent, Melanchthon, a common practice among scholars. Having taken the bachelor's degree when 14, he took the master's degree at Tübingen when 17 and at once began to lecture on Terence, Vergil, and rhetoric; when 19 he published an edition of Terence, which ran through 73 editions in the course of about a century. His Latin and Greek grammars enjoyed still larger use even in Catholic schools.

Most opportunely for Luther, who had posted his theses the year before, Melanchthon was now called to the chair of Greek at Wittenberg and in 1518 delivered his inaugural upon "Reform in the Studies of Youth." This address won the admiration of those who had depreciated him for his boyish appearance. The next year Melanchthon took the bachelor's degree in theology, but modestly declined the doctorate. Never ordained, never preaching, he remained, like Calvin, a lay theologian to the end of his days. His lectures were thronged, sometimes, as reported, to the number of 2000, including even princes and noblemen.

From his classical studies he was drawn by Luther's urgency and the prevailing ferment into the field of theology. By his *Loci Communes*, i.e., general outlines of theology, he made in 1521 his first great contribution to the Reformation. From Melanchthon's architectural and organizing spirit, according to Dorner's view, the truth born in Luther's heart received its objective form and the stamp of validity. Equally important was the aid he gave to Luther's Bible work, in which the accuracy is his, while its idiomatic force and beauty are Luther's. In

1526 he became professor of theology in name, as for years he had been in fact.

Among the Reformers, Melanchthon was characteristically the peacemaker. The Augsburg Confession, presented by the Protestants at the Diet in 1530, surprised even the Catholics by its moderate tone. The tone was Melanchthon's, who drafted it from articles drawn up by Luther. In 1531 Melanchthon published his *Apology*—a vindication of the Augsburg Confession and the most learned of the Lutheran symbols. After this date he wrote his name Melanthon, as easier to pronounce. His irenic spirit prompted him to issue a modified edition of the Confession, the *Variata* (1540), generalizing specific statements of the Lutherans objectionable to the Calvinists, with the design of removing impediments to the union of the two parties. But such efforts brought only bitter trouble upon Melanchthon. He had now reached the limit of his successes, and his remaining years were darkened by the failure of his efforts for a more ethical theology and for the union of the Protestant factions.

Melanchthon's treatises on ethics, in which Aristotle was his master, became standard textbooks. These ethical studies revealed to him defects in his theological masterpiece, the *Loci Communes*, which he amended by successive revisions in 1535 and 1543. They also occasioned a serious breach between the Philippists and the strict Lutherans, whose extreme denial of the freedom of the will made Christian ethics impossible. Cries of heresy arose, which no explanations could still. Another breach was caused by Melanchthon's slow but sure change from the Lutheran conception of the mode of Christ's presence in the Lord's Supper to the Calvinistic. A third ground of odium was Melanchthon's willingness, for the sake of avoiding civil war, to compromise with the Catholics by securing tolerance of evangelical doctrine, but retaining most of the Roman ceremonies, as *adiaphora* (things indifferent). In the bitter controversy which ensued the Philippists were hounded as knaves, Samaritans, and Baalites. Melanchthon's relations with Luther were strained, but to the last his gentle spirit held captive that fiery heart. He looked forward to death as "escape from the madness of theologians." His last prayer was "that the churches might be of one mind in Christ." He died April 19, 1560.

Melanchthon seems from one point of view to have been born before his time and has been long in coming to his rights. In a period of fanatical strife, he earnestly strove to bring about Christian unity. But on the honor roll of the Reformation his is conspicuously the historical, judicial, progressive spirit. His one great weakness was his consenting with Luther and others to the bigamy of Philip of Hesse, and his regret for it threw him into a dangerous illness. Declining invitations to other German cities, to France, to Denmark, to England, he stood unflinchingly at his post in stormy Wittenberg. The churches he found it impossible to reconcile now unite in honoring him. Lacking the dramatic element which draws the popular heart to Luther, his blending of progress and tolerance, of sweetness and light, attracts the cultivated mind.

Bibliography. Melanchthon's works, including his correspondence, fill volumes i-xxviii of the *Corpus Reformatorum*, edited by Bretschneider and Bindseil (Halle, 1832-50). The Wittenberg edition of his works was published in

1562-64. His *Loci Communes*, edited by Plitt (Erlangen, 1864), was reëdited by Kolde (ib., 1890). In German: his *Leben und Wirken*, by Matthes Altenburg (1841; 2d ed., 1846); his *Leben und Schriften*, by C. Schmidt (Elberfeld, 1861). For biography: his *Life* (in Latin), by his friend Camerarius (Leipzig, 1566), edited by Neander in *Vita Quattuor Reformatorum* (Berlin, 1846); also Krotel's English translation of the *Life* by Ledderhose (Philadelphia, 1855). J. W. Richard, *Philipp Melancthon* (New York, 1898), is both popular and accurate. Valuable in special points of view are: Galle, *Charakteristik Melancthons* (Halle, 1840); Hartfelder, *Philipp Melancthon als Præceptor Germaniæ* (Berlin, 1889); Herrlinger, *Die Theologie Melancthons* (Leipzig, 1878). Philip Schaff, *History of the Christian Church*, vols. vi, vii (New York, 1890); id., *Creeds of Christendom* (ib., 1878), contain much valuable biographical and theological matter concerning Melancthon; also *Cambridge Modern History*, vol. ii (Cambridge, 1904), contains an exhaustive bibliography.

MELANESIA (Neo-Lat., from Gk. μέλας, *melas*, black + νῆσος, *nēsos*, island). A name applied to that division of Oceania in which the inhabitants have a dark skin, as distinguished from those of Micronesia and Polynesia, who are much lighter. (See MELANESIANS.) It comprises all the islands lying between New Guinea and the Fiji Islands and between the Equator and the Tropic of Capricorn (Map: East Indies, H 5). It includes the following groups: Admiralty Islands, Bismarck Archipelago, Solomon Islands, Santa Cruz, New Hebrides, New Caledonia, Loyalty Islands, and Fiji Islands. Politically Melanesia is apportioned to Germany in the north, to England in the Solomon Islands and Fiji, to France in the south, while the New Hebrides and Santa Cruz are ruled by a mixed Franco-British commission. For details, see the articles on the separate groups.

MELANESIANS. The natives of that part of Oceania known as Melanesia (q.v.). Some authorities consider them physically and linguistically a compound of the woolly-haired black Papuans, who may have been the aborigines of Melanesia, with the smooth-haired, light-colored Malays, who came to the archipelago as adventurers and immigrants. Of all the islanders of these regions they present in individual cases the strongest likeness to the equatorial African negro. Other scholars recognize a "Melanesian race," divided into Papuans and Melaneseans proper, the latter being taller and more dolichocephalic than the former, and having generally the large square or lozenge-shaped face with the straight or *retroussé* nose of the Melanesian race. The Melaneseans are in general sedentary and devoted to agriculture, being only occasionally hunters and fishers, and they use the pig as a domestic animal. Many of the Melaneseans make, or once made, pottery, an art practiced by none of the Polynesians. Its present distribution is limited to New Caledonia, and Espiritu Santo, the Shortland Islands, Bougainville, Buka, and the Fiji group; but ceramic remains have been found in Malakolo, Pentecost, Lepers' Island, and Ambrym. The Melaneseans have double canoes and outriggers, but are not given, like the Polynesians, to long voyages. With most of them the characteristic dwelling is built on piles (see LAKE DWELL-

INGS), and often artistically decorated, while communal houses are found all over the Melanesian area. The bow and arrow (sometimes poisoned) are in use, with the club and spear, which lend themselves to ornamentation. Some of the hafted stone axes of the Melaneseans are very fine specimens of their kind. Kava, the characteristic drink of the Polynesians, is absent or subordinate, but betel chewing prevails generally except in New Caledonia. The Solomon Islands and a few other places still present examples of cannibalism, while head hunting, together with the preservation of the skulls of the dead, is well known. Taboo assumes in Melanesia a less clear form than in Polynesia, amounting to simple interdiction without the intervention of mysterious forces. Tribes proper are rare in Melanesia. The regulation of "group marriages" is very strict. Secret societies abound, including the famous *duk-duk* (q.v.), which corresponds in several curious respects to the modern club. There is usually a strict segregation of the sexes, the men living together in distinctive "men's houses" and the women being debarred both from these and from ceremonial performances.

MELANIIDÆ (Neo-Lat. nom. pl., from Lat. *melania*, from Gk. μελανία, blackness, from μέλας, *melas*, black). An extensive group of fresh-water gastropod mollusks characterized by the long spiral shell, with the whorls more or less knobbed or tuberculated, ribbed or striated, and a horny operculum. The animal has a broad foot or creeping disk, grooved in front; it is ovoviviparous. The species date from the Cretaceous period. They live in rivers, and the tubercles protect them from injury in rapid rocky streams. The species are distributed throughout north Africa, Syria, China, India, the Philippine Islands, Polynesia, and South America. In the southern United States, mostly in a rough square formed by the Tennessee, the Mississippi, the Chattahoochee rivers and the Gulf of Mexico, occur in abundance the Pleuroceridæ, represented by the genus *Io*, which were formerly associated with the Melaniidæ.

MELANIPPE. 1. In Greek mythology, a daughter of Chiron. Being about to bear a child, she fled to Mount Pelion to conceal herself from her father, and was changed into a mare by Artemis and placed among the constellations. She is also called Evippe. 2. A sister of Mele-

ager, who died with grief at her brother's fate. 3. A sister of Hippolyte and Queen of the Amazons.

MEL'ANIP'PUS. In Greek mythology, a Theban, son of Astacus. In the expedition of the Seven against Thebes (see SEVEN AGAINST THEBES, THE) he dealt Tydeus (q.v.) the wound which caused his death. He was himself killed by Amphiaras (q.v.).

MEL'ANISM (from Gk. μέλας, *melas*, black) and **AL'BINISM** (from Lat. *albus*, white). Melanism is a phenomenon due to excess of pigment, while albinism is due to its absence. Albinism is a pathological condition, while melanism is usually normal. Melanism occurs in insects, fishes, reptiles, birds, and mammals, and is noticeable in man. While in animals and man albinism is the result of disease, it may occur in nature as a sport; thus we have albino varieties. The absence of pigment is normal in such Arctic animals as the polar bear, the northern or white owl, etc.; others turn white in winter, as the Arctic fox, the American varying hare, the ptarmigan, etc. The change of color in such cases is apparently due to cold and is associated with the development of numerous air bubbles in the hair; in some cases there is no loss of pigment, which is merely concealed by the air bubbles (Newbigin).

In man the dark races owe the color of their skin to a black pigment deposited in the deeper layers of the epidermis, this pigment in the blond or white race being but slightly developed. As the darkest negroes inhabit the low torrid coast of west Africa, the pigmentation seems due to light, heat, and moisture combined. On the other hand, the cool damp climate of elevated or mountain regions and of the polar lands causes melanism. It is well known that the insects, more especially moths and butterflies, inhabiting alpine slopes or mountain regions are darker than individuals of the same species, or of allied species, living on the drier and warmer lowlands. Packard has called attention to the melanotic moths on the summits of the White Mountains of New Hampshire and along the coast of Labrador. Leydig was the first, perhaps, to point out that variation towards greater darkness of coloring is connected with the action of moisture. The temperature experiments of Weismann, W. H. Edwards, and Merrifield have proved that besides moisture and elevation cold is an important agent in excessive pigmentation, at least, of Lepidoptera and beetles. The most striking experimental evidence of the importance of humidity in the inducing of melanistic conditions is that presented by Beebe in his experiments with ground doves and other birds. Under conditions of intense humidity the birds became successively darker with each molt, until signs of iridescence were apparent. But melanism is not entirely confined to northern animals. The black leopard of southern Asia is a melanotic variety or sport of the common leopard. The varying hare is infrequently melanistic.

The prevailing coloring matters in the pigments of mammals are the dull-colored melanins. It has been thought that in mammals the pigment is directly derived from the hæmoglobin of the blood. Floyd, however, has shown that the skin of the negro contains about twice as much iron as the white skin, apparently due to the proteid present in the pigment granules. Consult: Newbigin, *Color in Nature* (London,

1898); Delépine, "Origin of Melanin," in *Journal of Physiology*, vol. xi (ib., 1890); C. W. Beebe, in *Zoologica*, vol. i (New York, 1907).

MEL'ANITE (from Gk. μέλας, *melas*, black). See GARNET.

MEL'ANORRHŒA (Neo-Lat., from Gk. μέλας, *melas*, black + ροία, *rhoia*, a flowing). A genus of trees of the family Anacardiaceæ. To this genus belongs the black varnish tree (*Melanorrhœa usitata*) of Burma and the north-east of India, called *Theet-see* or *Zitsi* in Burma, and *Khew*, in Manipur, attaining a height of 100 feet, with large, leathery, simple, entire, deciduous leaves and axillary panicles of flowers. It is much valued as a varnish for painting vessels intended to contain liquids, and also as a size glue in gilding. The varnish, which is obtained by tapping the stems, turns black on exposure to the air. See VARNISH TREE.

MELAPHYRE, mēl'ā-fir. See BASALT.

MELAZZO, mā-lăt'sō. See MILAZZO.

MEL'BA, NELLIE (1861-). An Australian operatic soprano. Her family name was Mitchell, Melba being an adaptation from Melbourne, in which city she was born. She studied under Marchesi and made her first public appearance as Gilda in *Rigoletto* at Brussels in 1887. An unsurpassed coloratura singer, she became known and admired in every great city of the world, being especially successful in grand opera in America. Her first appearance in the United States was at the Metropolitan Opera House, New York, in 1893, in *Lucia di Lammermoor*. Though possessing a voice of exceptional purity and beauty, she failed to develop real dramatic intensity and histrionic ability. After some years in concert, Mme. Melba returned to opera in 1915-16 as a member of the Chicago Company. Consult A. G. Murphy, *Nellie Melba: A Biography* (London, 1909).

MELBOURNE, mēl'būrn. The capital of Victoria, Australia, situated chiefly on the north bank of the Yarra, which river finds its outlet a few miles from the city in Hobson's Bay (Map: Australasia, G 6). The bay is the north bend of the spacious inlet known as Port Phillip, the entrance of which is 40 miles south of the city, near the southernmost extremity of the continent. The chief port is about 2½ miles distant from the business centre, but vessels with a 22-foot draft may go to the heart of the city. Melbourne occupies a high rank among British colonial ports. Its tonnage in the arrival of vessels in the over-sea trade is second to that of Sydney, but in interstate trade exceeded that of any other Australian port in 1912, the entrances in interstate trade in that year being 2,929,486 tons against 2,466,763 at Sydney. In the over-sea trade the entrances direct from other countries were 690,951 tons against 1,189,215 at Sydney, and from foreign countries via other commonwealth ports 1,679,459 against 2,076,067 at Sydney. In total tonnage, however, of foreign, interstate, and local from other ports of the state it was in 1912 second to Sydney. Melbourne is connected with all state lines of railway and is the centre of the system. It is the see of a Roman Catholic archbishop and of a Protestant bishop, and the seat of various consuls, including a United States consul general. The city is laid out with straight, wide, and regular streets, wood-blocked or macadamized, and supplied with gas, electric lighting, street tramways, and fresh water. The princi-

pal streets are 99 feet wide. It has been said that Melbourne's public buildings are finer than those of any other city of the same size in any part of the world. Among the most notable must be mentioned the magnificent Houses of Parliament, with a library of about 60,000 volumes; the Treasury; the Law Courts; the building assembling within its walls: (1) the Public Library of about 200,000 volumes, (2) the National Gallery, (3) the Technological Museum, and (4) the Sculpture Gallery; the Post Office; offices of the Mining, Lands, and other government departments, the Custom House; the Mint; the Treasury; the University, with its fine attached museum, its magnificent Wilson Hall, and affiliated Trinity, Ormond, and Queen's colleges; the Town Hall, with its grand organ and its assembly room; the Stock Exchange; the Exhibition Building in the Carlton Gardens, in which the commonwealth's first Parliament was inaugurated by King George V, then Prince of Wales, in the presence of an illustrious and representative gathering; the Produce Markets; the Eastern Market; the Fire Brigade Station; the City Baths; the London Bank of Australia; the Banks of Australasia, Victoria, and New Zealand; the Colonial, the English, Scottish, and Australian, and the Commercial banks; a Mint, opened in 1872; the National Mutual Life Office; the Equitable Life Assurance Society of the United States of America; the Western, the Queen Victoria, and the Fish, Cattle, and Hay markets; St. Patrick's Roman Catholic Cathedral; St. Paul's Anglican Cathedral; the Scots, the Wesley, the Independent, and the Baptist churches; and theatres and numerous amusement halls. There are many parks and pleasure grounds in Melbourne and its suburbs, each of the principal suburbs maintaining its own separate park, a beautiful government domain, botanical and zoölogical gardens, and cricket and football grounds. The Governor-General's and State Governor's residences are here; the commonwealth headquarters barracks; an observatory and a meteorological station; numerous schools for secondary education, including the famous Scotch College; and the institutions of many learned and scientific and literary societies.

Melbourne is a manufacturing city in the widest sense. The entrance to Port Phillip, which is only 2 miles wide, is formed by two projecting and strongly fortified promontories, called the Heads. Vessels drawing 22 feet reach Melbourne at ordinary tides. There are two dry docks at Melbourne and the splendid Alfred Graving Dock at Williamstown. The chief exports are gold, silver, wool, hides, cattle, and sheep. Six-sevenths of the commerce of the state is carried on by Melbourne. For further information regarding trade, etc., see VICTORIA.

Melbourne was first colonized in 1835 under the name of Dootigala, and received its present name in 1837 from Sir Richard Bourke, Governor of New South Wales, who named it after Lord Melbourne, then British Prime Minister. It became the see of a bishop in 1847, and in 1851 the capital of the newly formed colony of Victoria. The discovery of gold in Victoria in 1851 gave an extraordinary impetus to the material prosperity of Melbourne. The Australian centenary was commemorated at Melbourne in 1888 by an international exhibition. The first federal Parliament of the Australian commonwealth was opened in the exhibition building on Wed-

nesday, May 9, 1901, by King George V, then Prince of Wales, Melbourne being chosen as the temporary capital pending the choice of a seat on federal territory in New South Wales. The commonwealth has acquired an area of about 900 square miles from the state of New South Wales for a national capital. Population of Melbourne proper (1901), 67,881, including suburbs, 493,956; estimated, 1912, including suburbs and shipping, 628,430. Consult: Labilliere, *Early Days of Melbourne* (Melbourne, 1857); id., *Early History of the Colony of Victoria* (London, 1860-81); Finn, *Chronicles of Early Melbourne* (Melbourne, 1889); Gordon and Gotch, *Australian Handbook* (ib., 1906).

MELBOURNE, WILLIAM LAMB, second VISCOUNT (1779-1848). An English statesman. He was born at Melbourne House, London, March 15, 1779; was educated at Eton and at Trinity College, Cambridge, where he graduated in 1796, and at Glasgow (1799), where he studied jurisprudence and politics under Millar. One year after his admission to the bar (1804) he entered the House of Commons for Leominster and joined the Whig opposition, under the leadership of Charles James Fox. He represented several other constituencies within the next 15 years and his whole career in the House of Commons was characterized chiefly by indolence. Drifting towards conservatism, he accepted the chief secretaryship of Ireland in Canning's government. In 1828 the death of his father transferred him to the House of Lords. In 1830 he accepted the seals of the Home Office in the government of Earl Grey, but his administration was by no means popular or successful. In July, 1834, Earl Grey retired and William IV sent for Melbourne. In November, however, on a slight pretext, the King, who had become entirely alienated from the Whigs and Melbourne, invited Sir Robert Peel to form a Conservative ministry. On Peel's arrival in England he dissolved Parliament and appealed to the country, but was defeated. The new Commons, resenting the interference of the King, made Peel's task an impossible one, so early in 1835 Melbourne again became First Lord of the Treasury and Premier. On the accession of Queen Victoria in 1837 it became the duty of Melbourne to instruct the young sovereign in the various duties of her high station, and but few other functions did he perform so well. In 1841 his government was succeeded by that of Sir Robert Peel. Henceforward Melbourne took little part in public affairs. His administrations advocated reform of Church tithes in both England and Ireland, of municipal corporations, taxation, criminal law, postal rates and education, yet he himself cared little for reform. He married (1805) a daughter of the Earl of Bessborough, who, under the title of Lady Caroline Lamb, attained some celebrity as a novel writer and a correspondent of Lord Byron. Lord Melbourne died Nov. 24, 1848. Consult W. M. Torrens, *Memoirs of Lord Melbourne* (London, 1878), and Lloyd Sanders, *Lord Melbourne's Papers* (ib., 1889).

MELCHERS, mēlk'ers, GARI J. (1860-). An American genre, figure, and portrait painter. He was born in Detroit, Mich., studied at the Düsseldorf Academy, under von Gebhard, and at the Ecole des Beaux-Arts, Paris, under Lefèvre and Boulanger, and early made a specialty of Dutch peasant life, which he depicts with great insight and sympathy. He paints in cool grayish tones, with firm outlines,

and his work is simple, sincere, and often of almost brutal directness and naturalism. Melchers received many decorations and prizes, including medals of honor at Paris (1889) and Berlin (1891), and gold medals at Amsterdam, Munich, Vienna, Dresden, Antwerp, Philadelphia (1892), Buffalo (1901), and St. Louis (1904). Among his chief works are: "Maternity" and "Nurse and Children" (both in the Luxembourg, Paris); "The Family" (National Gallery, Berlin); "The Ship Builder" (Royal Gallery, Dresden); "Dutch Skaters" (Pennsylvania Academy, Philadelphia); "Sailor and his Sweetheart" (Carnegie Institute, Pittsburgh); "Penelope" (Corcoran Gallery, Washington); "The Madonna" (Metropolitan Museum, New York). Melchers also painted religious pictures, mural decorations, notably "Peace and War" in the Congressional Library at Washington, and many portraits, among which are Colonel Roosevelt (National Gallery, Washington) and Mrs. Melchers (Detroit Museum). He became Commander of the Legion of Honor and a member of the National Academy of Design, New York.

MELCHERS, PAUL (1813-95). A German cardinal. He was born at Münster, Westphalia. First he studied law at Bonn, but after a few years of practice in his native town he turned to the ministry, for which he was prepared at Munich. In 1841 he was ordained priest and in 1857 was made Bishop of Osnabrück. In 1865 he was nominated Archbishop of Cologne by Pius IX. At the Vatican Council Melchers at first opposed the doctrine of infallibility, but afterward acknowledged it, when the majority decided in favor of it. He took a prominent part in the Kulturkampf, and thereby frequently came in contact with the government authorities, and was removed from office in 1876. He escaped to Maestricht (Holland) from where he administered his diocese for nearly 10 years, resigning in 1885. He then went to Rome, became Cardinal in 1885, and joined the Jesuits in 1892. He wrote: *Eine Unterweisung über das Gebet* (1876); *Die katholische Lehre von der Kirche* (1881); *Das Leben der allerseiligsten Jungfrau und Gottesmutter* (1884); *De Canonica Diocesum Visitatione* (1892).

MELCHIADES, mēl-kī'ā-dēz. See **MILTIADES**.
MELCHIOR, CHARLES JEAN. See **VOGUÉ**.
C. J. MELCHIOR, MARQUIS DE.

MELCHITES, mēl'kīts (MGk. Μελαχίτης, *Melchitēs*, from Syr. *malkāyē*, royal, from *melek*, king). Originally a nickname given by the Monophysites in the fifth century to the Christians who remained orthodox in the patriarchates of Jerusalem, Alexandria, and Antioch. Since the thirteenth century, however, the name has been applied to the Christians of Eastern rite in Syria and Egypt who are in communion with Rome. They have had a patriarchate of their own, taking its title from Antioch, since 1744. Besides Damascus, there are 12 other dioceses subject to his authority, with between 300 and 400 priests and over 100,000 lay people. See **EASTERN RITE**, **CHURCHES OF**; **UNIATES**.

MELCHIZEDEK, or **MELCHISEDEC**, mēl-kīz'ē-dēk (Heb. *Malki-sedek*, king of righteousness, or Zedek is my king). A personage introduced in Gen. xiv. 18 as "king of Salem" and "priest of the most high God." After Abraham's return from the successful pursuit of Chedorlaomer (q.v.), King of Elam, and his allies, which he had undertaken in order to

rescue Lot, he was met by Melchizedek; the latter offered the patriarch bread and wine and blessed him; whereupon Abraham gave Melchizedek tithes from the spoil. Many scholars regard this story as a legend or a legendary elaboration of an historical tradition and think that this Midrashic character is indicated by the names Salem, 'Peace,' and Melchizedek, 'king of righteousness,' which seem to them symbolical. But it is generally admitted that the names of the invading kings are historical; those of the kings of the Pentapolis seem to be Amoritish. *Urushalimmu*, or 'the city of Salim,' is the name of Jerusalem in the Amarna tablets; Melchizedek may mean '(the god) Zedek is my king' and should be compared with Adonizedek (q.v.), 'Zedek is king,' another ruler of Jerusalem, and some scholars maintain that an early document has been used, that the reference to "Abram, the Hebrew," renders it probable that it was a foreign source, and that it is essentially historical, though they are willing to concede that it may have been worked over at a later time. In the Haggada Melchizedek is identified with Shem; the reference to Melchizedek in Psalm cx. 4 is late and obscure, but points to other conceptions current about this mysterious personage. In the Epistle to the Hebrews (vi. 20, vii. 1-21) he is taken as typifying Christ. Various other views arose with regard to Melchizedek. A small sect in the fourth century called after his name Melchizedekians taught that he was a power or incarnation of God greater even than Christ. Epiphanius says that some in his day believed that Melchizedek was the Son of God in human form.

MELCHORA, mēl-kō'rā. See **RAMA**.

MELCHTHAL, mēlk'tāl, ARNOLD VON. A legendary hero of the Swiss struggle for independence against Austria in the early part of the fourteenth century. Arnold was said to have killed the servant of an Austrian bailiff, who had come to Melchthal to seize the oxen of Melchthal's father, a well-to-do proprietor in Unterwalden. In revenge the Austrian put out his father's eyes. When Melchthal heard of his father's blindness he met his friends Fürst, of the Canton of Uri, and Stauffacher, of the Canton of Schwyz, on the banks of Lake Lucerne, and all three took an oath to do all in their power to liberate the three cantons from Austrian rule. This was in 1307, and the next year the mountaineers of the three cantons successfully waged war against the Austrians. The story is a myth. It is found in the *Chronicon Helveticum* of Aegidius Tschudi (1505-72), and was adopted by von Müller in his *History of the Swiss Confederation*.

MELCOMBE, mēl'kūm, GEORGE BUBB DODDINGTON, BARON. See **DODDINGTON**.

MELCOMBE REGIS AND WEYMOUTH, mēl'kūm rē'jīs ānd wā'mūth. A seaport of England. See **WEYMOUTH**.

MELDE'NIUS, RUPERTUS. The real or more probably pseudonymous author of the *Parænesis Votiva, pro Pace Ecclesiæ, ad Theologos Augustanæ Confessionis*, which appeared in Germany about 1630 without place of publication or date. It is a plea to the Lutheran theologians to lay aside their acrimonious controversy.

MELEAGER, mēl'ē-ā'jēr (Lat., from Gk. Μελέαγρος, *Meleagros*). In Greek legend, the hero of the Calydonian boar hunt. (See **CALYDONIAN BOAR**.) In the earliest-known form of

the legend, which is found in the *Iliad*, he is the son of Æneus, King of Ætolia, and Althæa, daughter of Thestius. When the Calydonian boar laid waste the land he gathered a band of heroes and, after a hard struggle and much loss of life, slew the monster. A strife arose between the Ætolians and the Curetes over the spoils of the hunt; the Curetes were led by his mother's brothers. Meleager led his people to victory, until he killed his mother's brothers. Althæa then cursed her son and prayed the Furies and gods of the lower world to punish him. The hero in anger withdrew from the fight and, knowing his fate, refused to return until the Curetes had actually stormed the town, when he yielded to the prayers of his wife and went forth to save his people, and met his death, according to one story at the hands of the Furies, according to another at the hand of Apollo. A later and more popular version introduced many alterations. When Meleager was seven days old the Fates told his mother that the child would live till a brand then blazing on the hearth should be consumed. Althæa thereupon quenched the brand, and put it in a chest. Later, on the news of the death of her brothers, she, in her grief and rage, put the brand again upon the fire, and the hero at once wasted away. This story appears in an ode of Bacchylides. Later still new features were introduced. The Calydonian Hunt brought together many heroes, among them the wild Arcadian maiden Atalanta, with whom Meleager fell in love. (See ATALANTA, 2.) She first wounded the boar, and received from her lover the head and hide. These the sons of Thestius, brothers of Althæa, in jealousy, took from her, and were killed by their nephew, whereupon Althæa allowed the brand to be consumed. Althæa was said to have killed herself in remorse, while the lamentations of his sisters and the women of Pleuron so moved the gods that they changed them into guinea hens (*μελεαγρίδες*), with the exception of the two sisters, Deianira, later the wife of Hercules, and Gorge. This story seems due to Sophocles.

The Calydonian Hunt was a favorite subject with the vase painters from early times, and on Greek and Roman sarcophagi; it was also taken by the great artist Scopas as the subject for one of the pediments of the temple of Athena Alea at Tegea. Fragments of these sculptures are now in Athens. A statue of Meleager, copied from a work of Scopas, is now in the Vatican at Rome, and a finer copy of the head and torso in the Fogg Art Museum of Harvard University.

MELEAGER (fl. c.60 B.C.). A Greek philosopher and epigrammatist, born at Gadara in Syria. As philosopher, he wrote *Menippean Satires*, imitated by Varro (q.v.), perhaps also a work (*Περὶ Δοξῶν*) giving a summary of the views of various philosophers. He compiled the first known Greek anthology, a collection called the Garland (*Στέφανος*), which contained epigrams by 40 authors, as well as 130 epigrams of his own, mostly of an erotic character. (See ANTHOLOGY, 1.) These are preserved in the later collection of Constantinus Cephalus, known as the *Palatine Anthology*. Consult: Symonds, *Studies of the Greek Poets* (London, 1893), chap. xxi; Ouvre, *Mélægre de Gadara* (Paris, 1894); Radinger, *Meleagros von Gadara* (Innsbruck, 1895); Pomeroy, *Meleager, etc.* (London, 1895); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

MELEAGER, STATUE OF. A celebrated

marble in the Vatican, representing the hero with his dog and a boar's head. The statue belongs to the Imperial period and was found near the Porta Portese at Rome about 1500. From its pathetic intensity of expression it is supposed to be a copy of an original by Scopas.

MEL'EA'GRIS (Lat., from Gk. *μελεαγρίς*, sort of guinea fowl, named after *Μελέαγρος*, *Meleagros*, Meleager). One of the two genera of the family Meleagridæ, containing the American turkey (q.v.); but the term belonged originally to one of the guinea fowls (q.v.). See Colored Plate of PEACOCK.

MELEGNANO, mǎ'lǎ-nyǎ'nō (formerly *Mari gnano*). A town of northern Italy, 10 miles southeast of Milan (Map: Italy, B 2). Pop., 1911, 7151. It is famous for a great victory won by Francis I of France over the Swiss and Milanese, Sept. 13-14, 1515. The defeat at Melegnano did much to destroy the prestige of the Swiss pikemen, who for a long time had enjoyed the reputation of being the best soldiers in Europe. Francis accepted the honor of knighthood on the field from the Chevalier Bayard. After the battle Francis I made a treaty with the Swiss, which lasted until the French Revolution. A second battle was fought here June 8, 1859, between a French force of 16,000 men, under Marshal Baraguay d'Hilliers, and a somewhat larger body of Austrian troops, the latter being routed.

MELEGUETTA (mǎl'ê-gét'tá) **PEPPER**. See GRAINS OF PARADISE; GUINEA PEPPER.

MEL'ENA, ELPIS. A pseudonym of Marie Espérance von Schwartz. See SCHWARTZ.

MELÉNDEZ VALDÉS, mǎ-lǎn'dáth vǎl-dās', JUAN (1754-1817). A Spanish poet, born at Ribera del Fresno in Estremadura, March 11, 1754. He graduated in law at Salamanca, where he soon fell under the influence of the so-called French school of writers. In 1780 he won the prize of the Spanish Academy for an ode. Coming to Madrid in 1781, Meléndez there enjoyed the favor of the minister and author, Jovellanos, who appointed him to a chair at the University of Salamanca. In this intellectual centre he became the chief figure of the Salamancan circle of lyric poets, who played an important part in the regeneration of Spanish literary production. With his comedy, *Las bodas de Camacho*, he won a prize offered by the city of Madrid in 1784; but the play failed on the stage. The next year he published his first volume of collected poems, which marked a decided improvement over most of the poetry that had been written since the *siglo de oro*. Meléndez now entered upon a political career that was to lead to his ruin. At his own request, made a judge of the court of Saragossa in 1789, two years later he was promoted to the chancery of Valladolid and in 1797 was given a post at the royal court. In 1798 Meléndez's constant friend, Jovellanos, fell from favor, and both were involved. Meléndez himself was exiled for a while, but in 1802 was allowed to settle in Salamanca. Having identified himself with the endeavors of the Napoleonic government in Spain, he incurred the hatred which his countrymen felt for the *Afrancesados*, and on several occasions he nearly lost his life at the hands of the excited populace. With the end of Joseph Bonaparte's rule he had to leave Spain, and, going into exile in France, he died at Montpellier, May 24, 1817. During this last period of exile he prepared a final edition of his lyrics,

which did not appear, however, until 1820. Meléndez was one of the few genuine poets that Spain produced during the decadent period of the eighteenth century. Consult the life of Meléndez by Quintana, prefixed to the edition of his poems of Madrid (1820), and also published with Quintana's prose works in volume xix of the *Biblioteca de autores españoles* (Madrid, 1852), and see also the edition of his poems in the *Biblioteca*, vol. lxiii (ib., 1869), and E. Mérimée's essay on him in the *Revue Hispanique*, vol. i (Paris, 1894).

MELETIUS, mè-l'è-shi-us (Lat., from Gk. Μελέτιος). The dates of his birth and death are unknown. Bishop of Lycopolis in the Thebaid in the beginning of the fourth century and founder of the sect of the Meletians. According to Epiphanius, during the persecution under Diocletian and Maximinus, many Christians were led through torture to renounce their faith; afterward repenting of their sin, they repaired to the bishops to receive absolution and to be reconciled to the Church. Peter, Archbishop of Alexandria, was willing to receive the backsliders on their doing penance, but Meletius refused to have any intercourse with them until the close of the persecution. This caused a schism, and Meletius became the leader of the disaffected. He traveled through the patriarchate, ordaining and excommunicating according to his own will, obtaining many followers, and disregarding the protest of the Egyptian bishops. This proselyting tour was extended to Palestine. But in 325 the Council of Nicea checked his career, compelling him to remain at Lycopolis as a mere titular bishop without active jurisdiction. He died soon after this. The Meletians afterward allied themselves with the Arians against Athanasius, continuing, however, a distinct sect until the fifth century.

MELETIUS OF ANTIOCH (?-381). A famous Greek ecclesiastic. He was born in the beginning of the fourth century at Melitene in Armenia Minor. His first important appointment was to the bishopric of Sebaste, but he soon resigned this and retired to Beræa (Aleppo) in Syria. In 360 he was chosen Bishop of Antioch. The church in that city was rent in twain by the Arian controversy, but Meletius, whose position was not well understood, was accepted by both parties. He was generally respected for his virtues, and the Arians believed him on their side. He disappointed their expectations, however, and the dispute raged more fiercely than ever. Meletius was several times banished and recalled. The Council of Alexandria sent representatives to Antioch to settle the dispute, but Lucifer (q.v.) of Cagliari by his hot-headed advocacy of the orthodox cause defeated the plan. Meletius died at an advanced age, while presiding over the Council of Constantinople, in 381. His body was taken to Antioch and buried with great honor. His funeral oration was pronounced by Gregory of Nyssa. A part of the inaugural discourse of Meletius at Antioch is printed in the fifth volume of Galland's *Bibliotheca Patrum* (Venice, 1765-81).

MELFI, mèl'fè. A town in the Province of Potenza, Italy, 41 miles south of Foggia (Map: Italy, E 4). It is situated on one of the sides of the extinct volcano, Monte Vulture, 1591 feet above the sea. Frequent earthquakes have destroyed most of its ancient buildings; the cathedral, dating from 1155, and the castle founded by Robert Guiscard, in which the Norman rulers

lived, alone remain. The town hall has a Roman sarcophagus among its relics. The soil of the vicinity is extremely fertile and produces grain, wine, and olives. Melfi is a very ancient city and is mentioned as early as the fourth century. It was the capital of Apulia at the time of the Norman occupation; was pillaged by Frederick Barbarossa in 1167; and in 1528 was captured by the French general Lautrec, who put to death thousands of its inhabitants. Pop. (commune), 1901, 14,649; 1911, 13,744.

MELGAREJO, mèl'gá-rá'hó, MARIANO (1818-72). A Bolivian soldier and revolutionist, born of illegitimate parentage at Cochabamba. Poorly educated, he entered the army as a common soldier, but through daring and bravery achieved high rank and fame. Taking part in various revolutionary movements, he became a power in politics. In 1865 he headed a successful revolution against President Achá and, assuming the presidency, exercised dictatorial powers. He became unpopular at once and his rule of six years was very stormy. He crushed out a revolt under General Belzú at La Paz (1866), and made a treaty with Chile adjusting a boundary dispute. He was overthrown in 1871 by a revolution led by Agustín Morales and was forced into exile. While living in Lima he was killed in an altercation with his son-in-law, José Sanchez.

MELI, mã'lè, GIOVANNI (1740-1815). An Italian dialect poet, born at Palermo. He studied and practiced medicine and in 1787 was appointed professor of chemistry at the University of Palermo. Meli wrote a number of *canzonette*, odes, and epigrams, mostly in Sicilian dialect, and made collections of Sicilian proverbs. His best work appears in his *Bucolica*, the *Fata galante*, the *Origini di lu mannu*, the mock-heroic *Don Chisciotti e Sanciu Panza*, and the *Favole morali*, in virtue of which he may be styled a Sicilian La Fontaine. His *Poesie* are included in the *Parnaso siciliano* (Palermo, 1874) and the best edition of his works is by Alfano (Palermo, 1894). Consult: Natoli, *Giovanni Meli: studio critico* (ib., 1883); De Sanctis, "Giovanni Meli", in his *Nuovi saggi critici* (Naples, 1914); Biondillo, "L'arte di G. Meli," in *Rivista d'Italia* (Rome, 1912).

MELIACEÆ (Neo-Lat. nom. pl., from *melia*, from Gk. μέλις, ash tree; so called because the leaves resemble those of the ash). A family of mostly tropical dicotyledonous trees and shrubs, containing about 40 genera and 750 species, natives of warm climates. Many of the species possess bitter, astringent, and tonic properties; some are used in medicine; the seeds of some yield useful oil; some are poisonous; some yield pleasant fruits; and the wood of some is valuable. (See CARAPA; MAHOGANY.) The cape ash (*Ekebergia capensis*) deserves notice among the timber trees of this order. It has a trunk 2 feet in diameter and yields excellent tough timber, useful for many purposes. *Melia azedarach*, the familiar chinaberry tree of the southeastern United States, a tree about 40 feet high, with large bipinnate leaves and large spikes of fragrant flowers, a native of Syria and other parts of the East, has long been planted as an ornamental tree in the south of Europe and is now common in California and the southern United States. The fruit is of the size of a cherry, somewhat elongated, pale yellow, when ripe, containing a brown nut. The nuts are bored and strung for beads in Roman Cath-

olic countries, whence the tree is often called bead tree. It is also known as the pride of India and is sometimes erroneously called Persian lilac. The fruit is sweetish, and not poisonous, although generally reputed so. The bark of the root, which is bitter and nauseous, is used as an anthelmintic. The pulp of the fruit of the neem tree or margosa tree (*Melia azadirachta*) yields a bitter fixed oil. The mahogany and Spanish cedar are both members of this family.

MEL/IBCE'A (Lat., from Gk. *Μελίβοια*, *Meliboia*). 1. A daughter of Oceanus, and mother, by Pelasgus, of Lycaon. 2. One of the daughters of Niobe.

MELIBCE'US (Lat., from Gk. *Μελίβοιος*, *Meliboios*). A shepherd in the first eclogue of Vergil.

MELIBCE'US, TALE OF. A prose tale in Chaucer's *Canterbury Tales*, taken probably from the *Livre de Melibée et de Dame Prudence*, a French rendering of Albertano da Brescia's Latin work, *Liber Consolationis et Concilii*.

MEL/ICER'TES (Lat., from Gk. *Μελικέρτης*, *Melikertēs*). Son of Athamas (q.v.) and Ino (q.v.), who leaped with him (or his dead body) into the sea. Thereupon both were changed to gods, Ino to Leucothea and Melicertes to Palæmon, who was the guardian of tempest-tossed ships. The Romans identified Palæmon with their god of harbors, Portunus. Palæmon was worshiped at Corinth, especially in connection with the Isthmian Games. (See ISTHMUS.) Story declared that dolphins conveyed the body of Palæmon to the Isthmus; Sisyphus, uncle of Palæmon, conveyed it to Corinth and at the order of the Nereids established the Isthmian Games in his honor. At Tenedos children were sacrificed to Melicertes. It is said that the name is the Greek transcription of the Semitic Melkart (or Moloch), meaning "the king"; at any rate, many have regarded the cult of Melicertes as of Phœnician origin. The Greeks seem rather to have identified Hercules with the Tyrian Melkarth, and, if Melicertes is derived from the Phœnician word, it is more probable that it is the title which Phœnicians gave to the Greek divinity, misunderstood as a proper name by the Greek worshipers. Consult the article "Melicertes" in W. H. Roscher, *Lexicon der griechischen und römischen Mythologie*, vol. ii (Leipzig, 1890-97), and Robert Brown, *Semitic Influence in Hellenic Mythology* (London, 1898).

MEL/IC GRASS (from Neo-Lat. *Melica*, from It. *melica*, great millet, from Lat. *mel*, honey; connected with Gk. *μέλι*, *meli*, Goth. *melih*, honey, OHG. *mili-ton*, AS. *mīle-dēaw*, Eng. *mildew*, literally honeydew), *Melica*. A genus of grasses of which nearly half of the species (about 30) occur in the United States. The others are found in temperate climates. They are perennials of small economic importance, with soft flat leaves and rather large spikelets in open or dense panicles. *Melica uniflora* is a common species growing in woods in Great Britain and Europe, and *Melica nutica* and *Melica nitens* in similar situations in the United States. Most of the American species are found from the Rocky Mountains westward.

MEL/ICOC'CA (Neo-Lat., from Gk. *μέλι*, *meli*, honey + *κόκκος*, *kokkos*, berry). A genus of trees or shrubs of the family Sapindaceæ, embracing five or six species, one of which, *Melicocca bijuga*, is a native of the West Indies, where it is cultivated for its fruit, known as the honeyberry, Jamaica bullace plum, and genip. It is from 20 to 40 feet high. The fruit is about

the size and shape of a plum, yellow or green in color, with a very agreeable flavor. It has been successfully grown in southern Florida and California. The seeds are roasted and eaten like chestnuts. Other species of *Melicocca* yield eatable fruits.

MELIKOV, mē'lyi-kôf, LORIS. A Russian soldier and statesman. See LORIS-MELIKOV.

MEL/ILITE (from Lat. *mel*, honey), or HONEY STONE. A complex mineral silicate of sodium, calcium, magnesium, aluminium, and iron, of uncertain formula. It crystallizes in the tetragonal system, has a vitreous lustre, and is white or of light shades of yellow, green, brown, and red in color. It occurs in various igneous rocks, certain varieties of which are known as *melilite basalts*. Melilite is found in Württemberg, Germany, in Italy, the Hawaiian Islands, and in several localities in the United States. It is also produced in furnace slags. The name is also given to a group of minerals including gehlenite.

MELILLA, mā-lē'lyā. A Spanish presidio on the north coast of Morocco (Map: Africa, D 1). It is built on a rocky peninsula extending into the Mediterranean and ending in the Cape of Tres Forcas. It is protected on the land side by a circle of forts, and a citadel commands the harbor, which in 1902 was opened as a port of commerce. Pop., 1910, 39,852, including the Spanish garrison. Melilla was occupied without resistance by the Spaniards in 1496. The Kabyles have made several unsuccessful attempts to capture it, the last being made in 1893, after which a neutral zone was established outside the fortifications. In 1908 a new revolt was brought on by certain mining operations. In 1910 the Riffians having yielded, the Spanish government restarted the mines and undertook harbor improvements.

MEL/ILOT, MELILOTUS (Neo-Lat., from OF. *melilot*, Fr. *mélilot*, from Lat. *melilotos*, from Gk. *μελιλωτος*, *melilōtos*, *μελιλωτον*, *melilōton*, a kind of clover, from *μέλι*, *meli*, honey + *λωτός*, *lōtos*, lotus). A genus of plants of the order Leguminosæ, natives of the Old World and widely disseminated. The species have upright stems, bear trifoliate leaves resembling those of alfalfa, and small white or yellow flowers from early summer until frost. They often take possession of waste ground, especially if composed largely of clay. All the species contain an ethereal oil known as cumarin, which gives them a strong, peculiar, sweetish odor, especially when drying. The white melilot (*Melilotus alba*), also known as sweet, Bokhara, or tree clover, is a common weedy biennial from 3 to 6 feet high, which is cultivated as a honey plant, and also to some extent for forage. For plowing under as green manure it is of some importance, especially upon heavy soil. Its roots perforate the substratum, and when they decay leave drainage tubes. In this way it may be used two or more years before being turned under as green manure. Another species which has become naturalized in the United States is the common yellow melilot (*Melilotus officinalis*), an annual growing 2 to 3 feet high and occurring in swamps and wet meadows. Its flowers are used in the manufacture of perfumery. The blue melilot (*Melilotus cœrulea* or *Trigonella cœrulea*), a native of northern Africa, is cultivated in Europe, and was formerly much used in medicine as an anodyne.

Melilotus is used for pasturage and for hay.

The green crop, cut when in bloom, has the following average percentage composition: water, 76.5; protein, 2.8; fat, 0.4; nitrogen-free extract, 12.1; crude fibre, 6.6; and ash, 1.6. Melilotus must be cured with care, as too much sun causes shedding of the leaves. At first animals commonly refuse to eat it, but later become used to it; its hay is generally used for home consumption. It is not as salable as other kinds of leguminous hay. Consult: *United States Department of Agriculture, Farmers' Bulletin 485* (Washington, 1912), and *Ohio Agricultural Experiment Station Bulletin 244* (Wooster, 1912). See CUMARIN.

MELILO/TUS. A genus of Leguminosæ (pea family), commonly called sweet clover, because the leaves are fragrant in drying. There are about 20 species, natives of Europe, Africa, and Asia, three of which have become naturalized in the United States, occurring as weeds in waste places and along roadsides. They are *Melilotus alba* (white sweet clover), *Melilotus officinalis* (yellow sweet clover), and *Melilotus indica*, the common names referring to the color of the flowers. The white sweet clover is much the commonest, is coming into use as a forage plant, and is also an excellent bee plant. See MELLILOR.

MELIN, mā-lēn', KARL ALFRED (1849-). A Swedish author, born at Utö and educated at Stockholm and Upsala (Ph.D., 1875). He published several collections of poems which became popular, among them *Humleplöckningen* (1882), *Princessen och svennen* (1885), a fairy poem in the style of old country ballads, *Dikter* (1888), *Skärgårdsbilder* (1891), and a new collection of *Dikter* (1904), all of which show lyric talent. In the field of drama he wrote *Vid Breitenfeld* (1893) and *Snöhvitt* (1897). His stories *De svarte vikingarnas saga* (1910) and *Tjuvbandet i Dagö skärgård* (1911) are favorites among young people. In 1898 Melin became a member of the Academy and in 1903 a member of the committee for the award of the Nobel prize.

MÉLINE, mā'lēn', FÉLIX JULES (1838-). A French statesman. He was born at Remiremont, studied law in Paris, and in 1860 was admitted to the bar. His earliest political activity was in the democratic opposition to the Empire. In 1871 he refused an election to the Commune, but in the following year was returned to the National Assembly, where he upheld Thiers and became a member of the Republican Union. For a few months in 1879 he was Undersecretary of State in Jules Simon's cabinet, and in 1880 made himself prominent by his able advocacy of the policy of protection. From 1883 to 1885 he was Secretary of Agriculture in Ferry's cabinet. Three years afterward, as President of the Chamber of Deputies, Méline carried through his great protective measure which went into force in 1892. Méline refused to form a ministry in 1893; undertook the management of the *République Française*, which he carried on until 1896; and in the winter of 1894 was reelected President of the Chamber. In 1896 he was made Prime Minister by Félix Faure and again took the portfolio of Agriculture. The May elections of 1898 forced the cabinet out, however, and Méline returned to the Chamber of Deputies. There he acted as the leader of the Conservative branch of the Republican party in opposition to the Radical wing, which, with the aid of the Socialists, had come into power under Waldeck-Rousseau. In 1899 he was a candidate for the presi-

dency of France. During the Dreyfus affair he was considered as an opponent of the accused captain and for that reason lost his political influence. After 1903 he was a member of the Senate from the Department of the Vosges. He founded the Society for Agricultural Merit and wrote *Le retour à la terre et la surproduction industrielle* (3d ed., 1905).

MÉLINGUE, mâ'lāng', ETIENNE MARIN (1808-75). A French sculptor and actor, born at Caen. He worked as a sculptor on the ornaments of the church of the Madeleine, Paris, at an early age, but soon went on the stage. After playing with a touring company he attained distinction at the Porte St. Martin in *Les sept enfants de Lara*, *Les mousquetaires*, *La reine Margot*, *Monte Cristo*, *Fanfan la tulipe*, *La dame de Montsoreau*, and *Le Bassu*. In *Benvenuto Cellini* he displayed his talents both as an actor and sculptor. His sculptures include: "Francis I.," "M. Duprez as William Tell," "Rabelais," "Satan," "Histrión," and "Eneis." His wife was the actress Théodrine Thiesset (1813-86).

MEL'INITE. Fused picric acid (melting point 122.5° C.), used in France as a bursting charge for armor-piercing shells, it having been found by Turpin that such a charge could be caused to detonate violently by the detonation of a primer of guncotton in contact with it. In England this bursting charge, made as described above, was styled lyddite. Turpin's original melinite (1886) consisted of picric-acid crystals cemented into cartridges by collodion. See EXPLOSIVES.

MELIS'MA (Neo-Lat., from Gk. μέλισμα, song, from μέλιν, melizein, to sing, from μέλος, melos, song). A term applied in modern music to melodic groups of notes executed upon one syllable of a word. It is particularly employed to give Oriental color. The songs of Rubinstein dealing with Oriental subjects (*Der Asra*, Verdi's *Aida*, and Goldmark's *Königin von Saba*) offer fine examples of melismatic writing.

MELIS'SA. A genus of plants. See BALM.

MELISSA. 1. In Greek mythology, a nymph by whom the use of honey was said to have been discovered, whence bees were called μέλισσαι. The actual derivation is from μέλι, honey. 2. The daughter of Procles and wife of Periander, who, in jealousy, killed her by a blow while she was with child. 3. In Ariosto's *Orlando Furioso*, a kindly fairy who protects Rogero and Bradamant (q.v.).

MEL'ITA. The Latin name of Malta (q.v.).

MEL'ITO, SAINT (Lat., from Gk. Μελίτων, Melitōn). Bishop of Sardis, in the second half of the second century. He is mentioned by Eusebius as an upholder of Catholic orthodoxy, and is known to have written many works, only fragments of which are extant. Among those mentioned by Eusebius are an *Apologia* addressed to Aurelius concerning the paschal controversy, and *Eclogæ*, containing the first Christian catalogue of "the books of the Old Covenant." Consult: Otto, *Corpus Apologetarum Christianarum Sæculi Secundi*, vol. ix (Jena, 1842-72); Adolf Harnack, *Texte und Untersuchungen*, vol. i (Leipzig, 1882); the translation in the *Ante-Nicene Fathers*, vol. viii; Adolf Harnack, *Geschichte der altchristlichen Literatur* (Leipzig, 1893).

MELITOPOL, mā'lē-tō'pōl-y'. A town in the Government of Taurida, south Russia, situated

on the river Molóchnaya, 150 miles north-northeast of Simferopol (Map: Russia, E 5). It has a Gymnasium and a Realschule and carries on some trade in agricultural products and salt. It was founded in the beginning of the nineteenth century. Pop., 1897, 15,120; 1910, 18,519.

MELITOSE and **MELITRJOSE**. See SUGARS.

MELITZASE. See ENZYME.

MELK, HEINRICH VON. See HEINRICH VON MELK.

MEL/KARTH. A Phœnician divinity identified by some with the Greek Melicertes (q.v.). He was the special god (Baal, q.v.) of Tyre, where he had a magnificent temple. He represents the old Chaldean sun hero and god of navigation. Because of his adventures, strength, and labors the Greeks identified him with Hercules (q.v.); on later Greek coins Baal-Melkarth is frequently represented as Hercules.

MELLEN, CHARLES SANGER (1851-). An American railroad president, born at Lowell, Mass. After a public-school education he entered railroad work as a clerk in the cashier's office of the Northern New Hampshire Railroad in 1869, and did other clerical work on that railroad and the Central Vermont until 1880. He was assistant to the manager (1880-81), auditor (1881-83), superintendent (1883-84), and general superintendent (1884-88) of the Boston and Lowell and the Concord railroads; served as general purchasing agent (1888), assistant general manager (1888-89), and general traffic manager (1889-92) of the Union Pacific System; and for four years was general manager of the New York, New Haven, and Hartford Railroad. After serving as president of the Northern Pacific from 1896 to 1903, he was head of the New Haven in 1903-13 and of the Boston and Maine in 1910-13. He incurred much criticism because of the alleged effort which the road made to secure a monopoly of transportation lines in New England, and because of a defectiveness of organization, administration, and equipment which made possible an unusual succession of wrecks. In 1915 he announced his retirement from all business interests.

MELLIN DE SAINT-GELAIS. See SAINT-GELAIS, MELLIN DE.

MELLO, mál'lo, CUSTODIO JOSÉ DE (c.1845-1902). A Brazilian admiral. Having entered the navy and attained the rank of admiral, he came into political prominence, upon the establishment of the Republic, as a deputy in the national Congress. Attached to the federalist group, he opposed the dictatorial policy of President Fonseca and aided in the latter's overthrow (1891). He then became Minister of Marine, but when President Peixoto's actions indicated his intention to maintain himself in the position of a dictator, Mello resigned his position, issued a long pronunciamento (Sept. 6, 1893) embodying the charges against the administration, and took command of the revolt of the navy. The revolt had little chance of success, for it was not supported by an army. The navy bombarded Rio de Janeiro from time to time, but was prevented from doing much damage because of the opposition of the Powers, especially the United States, which refused to recognize the rebels as belligerents or allow any interference with commerce. Leaving the fleet, Mello went south, hoping to effect a conjunction with the revolt under Gumerindo Saraiva in

Rio Grande do Sul. Having conferred with the provisional government at Desterro, Mello conducted a successful expedition against Paranáguá, but he failed to take sufficient reinforcements back to Rio de Janeiro to bring success to the rebel cause. When he received news that Admiral Saldanha da Gama (q.v.) had surrendered the navy at Rio de Janeiro to Peixoto's new fleet Mello gave himself up to the Argentine authorities in April, 1894. He maintained that his sole purpose was to purify the Republic, but in 1901 he was suspected of being implicated in an Imperial plot and was arrested and confined on the island of Cabras.

MELLO, or **MELO**, FRANCISCO MANOEL DE (1611-66). A Portuguese poet and historian, born at Lisbon of a noble family and there trained in the humanities by the Jesuits. He became an army officer, first serving with the Spanish fleet, and for 10 years having a varied experience in Spain, Portugal, and Flanders in many positions of importance, and being commissioned to write the *Historia de la guerra de Cataluña*, a war in which he took part. Later we find him in the Portuguese service when his native country asserted its independence. Despite his loyalty, he was imprisoned by order of John IV on a false charge of attempted assassination made by the jealous Count of Villa Nova, and, after an incarceration that lasted from 1644 to 1653, he was banished to Brazil. There he remained six years, until the death of the monarch permitted his return to Portugal. From 1659 to 1663 he spent most of his time in Lisbon, where he frequented the Academia dos Generosos, whose president he was for five elections. Mello is one of the best Portuguese poets of the seventeenth century, commendably free from most of the mannerisms of the time. His numerous poetical compositions, first collected under the title of *Las tres musas de melodino* (1649), which contains only his Spanish verses, were later published as *Obras métricas* (Lyons, 1665) and included his Portuguese poems. These latter reveal him as a true poet and are not without popular and patriotic elements. Of Mello's other works in Portuguese may be mentioned certain prose compositions: the *Hospital das letras*, a dialogue containing much sound literary criticism; the *Apologos dialogaes* (1721); and the *Carta de guia de casados* (1651), in which the author gives a picture of Portuguese family life of the period. Not the least meritorious of Mello's productions is the previously mentioned historical work, *Historia de los movimientos, separación, y guerra de Cataluña* (1645), which is in Spanish. An historical treatise in Portuguese is the *Epanaphoras de varia historia portugueza* (1660).

Bibliography. The *Obras metricas de D. Francisco Manoel* and his *Obras* in general (Lyons, 1665); the verse comedy *Auto do Fidalgo Aprendiz* in the *Musas*, and also separately in 1676, cf. T. Braga in his *Theatro portuguez no seculo XVII* (Lisbon, 1870-71); also I. F. da Silva, *Diccionario bibliographico portuguez* (ib., 1858 et seq.); P. Chasles, *Voyages d'un critique* (Paris, 1869); Branco in the edition of the *Carta de guia de casados* (Oporto, 1873); Edgar Prestage, *Don Francisco Manuel de Melo, esbozo biografico* (Coimbra, 1914). For a discussion of Mello's prose style: Melo, *Carta de Guia de Casados*, edited by C. Castello Branco (Lisbon, 1898); Georges Cirot, in *Mariana, historien* (Bordeaux, 1905); Melo, *His-*

toria de los movimientos, separación y guerra de Cataluña, edited by J. O. Picón (Madrid, 1912).

MELLONE, mēl-lōn', SYDNEY HERBERT (1869-). An English Unitarian educator, son of an Irish clergyman. He was educated at University College, London, at Edinburgh University, and at Manchester College, Oxford. From 1898 to 1909 he was minister of the First Presbyterian (Unitarian) Church, Holywood, County Down, and in 1909-11 of St. Mark's Chapel, Edinburgh. He then became principal of the Unitarian Home Missionary College, Manchester. He contributed to Hastings, *Encyclopædia of Religion and Ethics* and published: *Studies in Philosophical Criticism and Construction* (1897); *Leaders of Religious Thought in the Nineteenth Century* (1902); *Test Book of Logic* (1903; 6th ed., 1913); *Elements of Psychology* (1907; 2d ed., 1910), with Miss Margaret Drummond; *Laws of Life* (1908); *The Immortal Hope* (1911).

MELLONI, mēl-lō'nē, MACEDONIO (1798-1854). An Italian experimental physicist, famous for his researches on the subject of radiant heat. He was born in Parma. In 1824 he was called to the chair of natural philosophy in the University of Parma. Banished from Italy, he was a professor in the Department of the Jura until his return in 1839, when he became director of the cabinet of arts and trades in Naples. He was appointed by the King of Naples director of the meteorological observatory on Mount Vesuvius (1839). In the same year he was elected a member of the Royal Society. He discovered the existence of heat in lunar light, and was a pioneer worker in the field of radiant heat. Realizing the identity of radiant heat and light, he investigated the transparency of various substances to radiant heat and first used the word diathermancy (q.v.) to express this property. He successfully developed the use of the thermopile for heat measurements. Melloni published numerous memoirs on various topics in natural philosophy, and the unfinished book *La thermochrose, ou la coloration calorifique* (1850). Consult biographical sketch by J. Lovering in *Proceedings of the American Academy of Arts and Sciences*, vol. iii (1857), and S. P. Langley, *Address before American Association for the Advancement of Science* (1888).

MEL'ON INSTITUTE OF INDUSTRIAL RESEARCH. An integral part of the University of Pittsburgh (q.v.), but possessing an endowment of its own, totaling over half a million dollars. The system of coöperation between science and industry, founded by Robert Kennedy Duncan, forms the basis of the work of the institute. According to this system, an individual or a company having a problem requiring solution establishes a fellowship by contributing to the institute a definite sum of money for a period of not less than one year; the money is used to pay the salary of the man or men selected to carry out the investigation desired, while the institute furnishes all necessary laboratory facilities and guidance in the work. The results obtained become for the time being the property of the donor of the fellowship. The present director is Dr. Raymond F. Bacon, and at the present time 40 research chemists are engaged in the study of 23 different industrial problems. In 1915 a department of research and graduate instruction in pure chemical science was established within the institute and placed under the direction of Dr.

M. A. Rosanoff (q.v.). The expenditure for salaries and maintenance amounted to over \$150,000 in 1914. The institute occupies a building specially designed for its needs and erected at a cost of \$350,000.

MEL'MOTH, COURTNEY. The pen name of the English miscellaneous writer Samuel Jackson Pratt (q.v.).

MELO. See **MELLO**.

MELOCRINUS, mē-lōk'rī-nūs. A genus of crinoids with large, melon-shaped, many-plated calyx and biserial arms, found in the Silurian of Europe and especially in the Devonian of eastern North America. It furnishes some of the most beautiful fossil forms, as *Melocrinus nobilissimus*. It was formerly known as *Mariacrinus*. See **CRINOIDEA**.

MELO'DEON. The early American organ, in which an exhaust or suction bellows draws the air inward through the reeds. About 1836 J. Carhart made a number of improvements in the melodeon, and upon the application of still further inventions by E. P. Needham and E. Hamlin the instrument became widely popular. The supply of wind for the reeds is obtained by means of a pair of treadles worked by the performer, and the reeds themselves are controlled by stops and slider mechanism. The tone of the instrument has been steadily improved, and now successfully imitates a number of orchestral instruments. See **HARMONIUM**; **ORGAN**.

MELODRAMA, mēl'ō-drā'mā (from Gk. μέλος, *melos*, song + δράμα, *drama*, action, play). Properly a half-musical drama, or a dramatic performance in which the dialogue is interspersed with music. Rousseau's *Pygmalion* is commonly cited as the first French melodrama, and some of the earlier English operas are of this type. In Italy, however, the name was first applied to the opera by its inventor, Ottavio Rinuccini, near the end of the sixteenth century. In Germany the term has been particularly used to designate a declamation with instrumental accompaniment (as distinguished from the *recitative*, which is characteristic of the regular opera, q.v.). The object of the music is to intensify the emotions evoked by the spoken words, which may be a poem like Schiller's *Lied von der Glocke* or a regular drama; but the æsthetic value of the practice has been much disputed and it has almost fallen into disuse in serious works. At present the word is commonly used to designate the type of play which depends for its interest on sensational incidents and extravagant situations rather than on a truthful representation of life. This use of the word appears to have originated in France, where, in the latter part of the eighteenth century, it came to be applied to the style of popular tragedy in which were presented the conventional types of stage villains, persecuted innocent heroines and their kind, along with elements of comedy as well as of music and dancing, and with a regularly happy ending in deference to well-known popular preferences in this respect.

MEL'ODY (Lat. *melodia*, Gk. μελωδία, from μέλος, *melos*, song + ὀδή, *ōdē*, song). A succession of tones constituting a musical phrase. That this succession be pleasing is not absolutely essential. Whereas harmony considers all the tones sounded simultaneously in the various voices or parts, melody primarily considers the various tones of only a single voice or part, i.e., in relation to every preceding or succeeding tone. Broadly speaking, it has been stated that a

melody rising in pitch corresponds to the more violent emotions, such as determination, desire, longing, striving; while a melody falling in pitch corresponds to the more passive states, as resignation, contemplation, sadness. But in reality a melody can never be considered absolutely by itself. The character of every musical phrase is determined by a combination of three vital and fundamental elements, melody, harmony, and rhythm, each of which affects the others. This is easily seen by examining any of Wagner's leading motives, where the same melodic phrase is rendered capable of great emotional variety by changes in the harmonic or rhythmic elements. In fact, the same succession of notes may sound noble or trivial according to the choice of refined or commonplace harmonies supporting it. There is an endless variety in the succession of musical tones forming a melody, some being so easily intelligible that even people of little musical taste can distinguish them, as is the case with some popular dance forms. The term "melody" is by no means synonymous with *cantilena*, as many seem to think. The former term is infinitely broader than the latter. No special course in melody is given in conservatories, although in recent years several theoretical treatises on the subject have appeared. The pupil almost unconsciously acquires the practical elements of melodic forma-

Comparing this with the original, it will be seen how Beethoven constructs his melody. The reader should examine in the score the successive melodic changes which the theme of the third example undergoes in the course of the movement. Wagner in the prelude to *Die Meistersinger* reduces the Mastersinger's motive and the second theme from Walter's Prize Song to a common harmonic basis (slightly different from that of either of the themes in its original form), and thus is enabled to make both themes resound simultaneously on different instruments. (Piano score, p. 7.) Without making the slightest alteration in Bach's C major prelude from the *Well-tempered Clavichord*, Gounod writes an additional melody to the harmonic basis, which has become famous as Gounod's *Ave Maria*.

The following examples show how a mere succession of intervals can be changed by the infusion of the rhythmic element into a distinctive melody. In Wagenseil's book, *Von der Meistersinger holdseligen Kunst*, we find the following two tunes of prize-crowned master songs:

Both these simple tunes Wagner uses in the Processional March of *Die Meistersinger*, where they occur in these forms:

tions while pursuing the study of harmony and the higher forms of composition.

Upon any harmonic basis a practically endless number of melodies may be written, and, vice versa, all melodies can be reduced to a simple harmonic basis. To illustrate this let us take the opening theme of the famous andante of Beethoven's Fifth Symphony. The harmonic plan is as follows:

Upon this basis Beethoven wrote the melody originally in this form:

When he came to write the full score the master felt that his theme was commonplace. By retaining the harmonic basis and only altering the melodic intervals the following noble melody, such as we know it, arose:

The following is a reduction to the simplest harmonic basis of the principal themes of the well-known Sonata op. 53 (Waldstein):

All melody can be conceived as a rhythmic evolution from a succession of intervals in notes of equal value, and, vice versa, all melodies can be reduced to a monotonous succession of intervals. It is the composer's individual genius that imparts its character to each melody. Within recent years several theorists have attempted a scientific exposition of the principles of melodic formations with practical hints towards their invention. Among the best works of this kind are: Bussler, *Elementarmelodik* (Berlin, 1879); Riemann, *Neue Schule der Melodik* (Hamburg, 1883); E. Cremers, *L'Analyse et la composition mélodique* (Paris, 1898).

MEL'OGRAPH (from Gk. *μελογράφος*, *melo-graphos*, song writing, from *μέλος*, *melos*, song + *γράφειν*, *graphein*, to write). A mechanical device for making a record of music as it is played on a pianoforte. It is supposed to reproduce on paper, by means of characters, all the notes struck on the keyboard (with their duration), so that there may be a readable record of any music which a player may improvise.

Since 1747 numerous melographs have been patented, but with the exception of Fenby's "electric melograph" or "phonautograph" none

has given lasting satisfaction. In the phonograph under each key is placed a stud; when the key is depressed an electric connection is formed, and the particular note struck and its duration are recorded on paper. All these devices were superseded by the invention of Edison's phonograph (q.v.).

MELOIDÆ, mē-lō'i-dē. A family of moderate-sized beetles, with the head constructed behind the eyes, the prothorax at its hinder edge narrower than the elytra, the legs long, with front haunches large and conical, the feet with the last segment but one not bilobed, and the claws split to the base. The larvæ of several undergo metamorphosis (q.v.); and most of the species exude an odorous oil, highly serviceable in medicine. Consult: Le Conte, "Synopsis of the Meloids of the United States," in *Proceedings of the Academy of Natural Science*, vol. vi (Philadelphia, 1853); Horn, "Revision of the Meloidæ of the United States," in *Proceedings of the American Philosophical Society*, vol. xiii (ib., 1873); id., "Studies among the Meloidæ," in *Transactions of the American Entomological Society* (ib., 1885).

MEL'ON (OF. *melon*, *millon*, Fr. *melon*, from Lat. *melo*, for *melopepo*, from Gk. *μηλοπέπων*, *mēlopepōn*, *melon*, from *μήλον*, *mēlon*, apple + *πέπων*, *pepōn*, *melon*, so called from the shape). The plants and fruits of *Cucumis melo* and *Citrullus vulgaris* of the family Cucurbitaceæ. See MUSKMELON; WATERMELON.

MELON CATERPILLAR MOTH. See MELON INSECTS.

MEL'ONECHI'NUS (Neo-Lat., from Gk. *μήλον*, *mēlon*, apple + *ἐχίνος*, *echinos*, the sea urchin). A fossil sea urchin found in the Sub-Carboniferous rocks of North America and Europe. The test is melon-shaped with vertical grooves, is 4 to 6 inches in diameter, and made up of numerous thick hexagonal or pentagonal plates that are regularly arranged in vertical series and that are covered by minute tubercles and small needle-like spines. Large slabs of limestone on the surfaces of which are several finely preserved specimens of this sea urchin have been obtained from the vicinity of St. Louis, Mo. See ECHINODERMATA; SEA URCHIN.

MEL'ON INSECTS. Most of the insects which attack melons also feed upon certain other cucurbitaceous plants. Thus, the squash-vine borer (*Melittia ceto*) also bores in the stems of melons. The striped squash beetle (*Diabrotica vittata*) also feeds upon the leaves of melons, as does the cucumber flea beetle (*Crepidodera cucumeris*). The melon caterpillar (*Margaronia hyalinata*) is a widely distributed insect found through the greater part of North and South America, and is particularly destructive in the southern part of the United States. The caterpillars of the first generation feed upon the leaves and those of the second generation eat into the fruit of melons, cucumbers, and pumpkins. The wings of this moth are pearly white with a peculiar iridescence, are bordered with black, and measure about an inch from tip to tip. A similar and closely related caterpillar, the larva of *Margaronia nitidalis*, also feeds in the fruit of melons and cucumbers. Poisoning the foliage with some arsenical mixture to destroy the larvæ of the first generation is the standard remedy. The melon plant louse is perhaps the most destructive insect enemy of this plant. This insect has a wide range of food plants, but is an especial enemy of melons, and

feeds on the undersides of the leaves. Under-spraying with a kerosene-soap emulsion is the only remedy in large fields, but in small gardens carbon disulphide may be used under inverted tubs or paper coverings. See Colored Plate of MOTHS, AMERICAN.

MELONITES, mēl'ō-nī'tēz. See MELONECHINUS.

MEL'ON TREE. See Plate of PAPAW.

ME'LOS (Lat., from Gk. *Μῆλος*), or **MIL**O. The southwesternmost island of the Cyclades in the Ægean Sea, about 70 miles northeast of Crete and 65 miles east of the Peloponnesus (Map: Greece, Ancient, D 3). It is 14 miles long and 8 broad, with an area of 52 square miles, and has on its northern coast one of the best and safest natural harbors in the Levant. The island is crescent-shaped and seems to be part of the rim of the crater of an old volcano. The highest eminence is Mount St. Elias (2539 feet), in the southwestern part. The island shows many traces of its volcanic character and contains hot mineral springs and considerable deposits of sulphur. The soil is fertile and produces good crops of grain, especially barley, as well as wine and oil. Salt, gypsum, and millstones are exported. The chief town is Plaka, in the northern part of the island near the site of the ancient capital, Melos, of which extensive remains are to be seen. Near the sea the ground is marshy, and the air is unwholesome in summer. In prehistoric times the island seems to have been of some importance, on account of the obsidian found in its rocks, used in the Stone age for knives and arrowheads. The chief settlement was on the northeast coast near the modern Phylakopi, where are remains of three successive towns, extending from the Stone age to the end of the Mycenaean period. There are traditions of Phœnician occupation at a later time, but during the classical period Melos was inhabited by Dorians, and during the Peloponnesian War was one of the few islands not in the Athenian League. Though the inhabitants were willing to remain neutral, the Athenians in 416 B.C. seized the island, killed the men and sold the women and children into slavery. With the fall of Athens, however, the Athenian colonists were expelled by Lyssander, and the former inhabitants were brought back so far as possible. Melos fell successively under the dominion of the Romans, the Byzantine emperors, Venice, and the Turks; it is now a part of Greece. During the later classical period the island evidently enjoyed considerable prosperity and was enriched with many works of art, some of which have been recovered from time to time. Notable among these are the fine "Poseidon" in the National Museum at Athens, the Asclepius now in the British Museum, and especially the "Venus of Milo," discovered in 1820 by a peasant, and now one of the chief treasures of the Louvre. From 1896 to 1899 excavations were conducted on the island by the British School at Athens, on the site of the ancient town of Melos, which led to the discovery of the hall of the "Mystæ," or "Initiated," and some foundations at the site of the ancient capital, near the modern village of Klima on the great bay. A theatre of Roman date, parts of the walls of the town, and houses of Greek times were also discovered. The chief result, however, was the recovery of the prehistoric settlements at Phylakopi, with a wealth of early pottery and some very interesting frescoes.

Bibliography. The reports of the excavations may be found in the *Annual of the British School at Athens*, vols. ii-v (London, 1897-1900), and the *Journal of Hellenic Studies*, vols. xvi-xix (ib., 1896-99); "Excavations at Phylakopi," in *Hellenic Society, Supplementary Papers*, vol. iv (London, 1904); *Annual of the British School at Athens*, vol. xvii (London, 1910-11). See VENUS OF MELOS.

MELOS (Neo-Lat., from Gk. μέλος, song). A musical term denoting the continuity of the melodic outline in any single movement of a composition. A symphonic movement, e.g., consists of several themes complete in themselves. In the movement, however, they do not appear as so many independent musical phrases with a full cadence, but follow one another in a certain order, one leading either directly or by means of a transition passage into the next, so that their connection, unbroken by any full cadence, forms a continuous melodic chain from the first bar to the last. This chain or aggregate of melodic phrases constitutes the *melos* of the movement. The term "melos" was first used in this sense by Wagner in his theoretical works. Every act of his musical dramas resembles a symphonic movement inasmuch that the melodic outline is never interrupted by a full cadence. The leading motives are treated and developed exactly like the themes in a symphony. Wagner is, therefore, justified in speaking of his "endless melody." In the opera every number closes with a full cadence. An act consists, therefore, of a collection of several numbers, each complete in itself, having no connection whatever with the preceding or following number. Although each number has its *melos*, the act can have none, and consequently no artistic unity, because the fundamental principle of unity is continuity. See also LEITMOTIV; MUSICAL DRAMA; RECITATIVE.

MELO'SA. A Chilean plant. See MADIA.

MELOZZO DA FORLÌ, mǎ-lôt'sô dà fôr-lê' (c.1438-94). An Italian painter of the early Renaissance, born at Forlì. He was a pupil of Piero della Francesca, who was then at the height of his fame, and worked with him in the castle of Urbino for Duke Federigo di Montefeltro. Melozzo was also introduced to the notice of Pope Sixtus IV and became a favorite painter. For this Pope and his nephew, Cardinal Riario, he executed his two great frescoes, "An Audience of Sixtus IV" for the Vatican Library, and an "Ascension" for the cupola of Santi Apostoli. The first of these has been transferred to canvas and is in the Vatican Gallery; the latter is in fragments, the figure of Christ being in the Quirinal and "Angels Making Music" in the inner sacristy of St. Peter's. The latter, with their majestic forms, glowing vitality, and rapt personality, are among the most exquisite examples of early Italian art. The whole work shows that Melozzo understood foreshortening, a part of perspective then little studied. His "Pesta Pepe" fresco, in the Pinacoteca at Forlì, representing an apothecary's apprentice pounding herbs, also furnishes an example of his strong feeling for tactile values and movement. The series of fine frescoes representing "Prophets and Angels" and the "Entry into Jerusalem" for the Casa Santa at Loretto were executed after his designs almost entirely by Palmezzano. Many other paintings are now doubtfully attributed to him, notably the fresco of "The Arts and Sciences" for the ducal library at Urbino,

portions of which are in London and Berlin, in which he is thought to have collaborated with Joos van Ghent. Consult: A. Schmarzow, *Melozzo da Forlì* (Stuttgart, 1886); Bernhard Berenson, *Central Italian Painters of the Renaissance* (New York, 1903); Ricci, *Melozzo da Forlì* (Rome, 1911); A. Schmarzow, *Joos van Ghent und Melozzo da Forlì* (Leipzig, 1912).

MELPOMENE, mēl-pōm'ē-nē (Lat., from Gk. Μελπομένη, the singing one, pres. pt. of μέλπειν, *melpesthai*, to sing). In Grecian mythology, one of the nine muses. When to the individual muses specific functions were assigned, Melpomene was called the muse of tragedy. In ancient art she was represented with a mask in her right hand and a roll of a part of a play in her left. See MUSES.

MEL/ROSE. A village of Roxburghshire, Scotland, on the Tweed, at the foot of the Eildon Hills, 37 miles southeast of Edinburgh (Map: Scotland, F 4). It is a popular resort with a hydropathic institute. It is noted for the remains of its Cistercian abbey, celebrated in history and literature, and the finest Gothic ruin in Scotland. Its erection dates from 1326, after the destruction by the English in 1322 of the Abbey of the Virgin Mary built by David I between 1126 and 1146 at Old Melrose on a promontory overlooking the river 2 miles to the northeast. The abbey was built from a fund supplied by King Robert Bruce and his son David II and was not finished until the middle of the sixteenth century. It was much mutilated and despoiled by the English in 1385 and in 1545. The present remains are the major portions of the abbey church, the choir, the transept, part of the nave, and the southern aisle with its eight small chapels, and fragments of the cloister, a square of 150 feet. The church is 258 feet long, width of transept 115 feet, height of central square tower 84 feet. It is a composite of late flamboyant Gothic architecture, rich in elaborate ornamentation; traceried windows, shafts, capitals, vaultings, and flying buttresses being its distinctive features. Abbotsford (q.v.), the home of Sir Walter Scott, is about 3 miles south of Melrose Abbey. Pop., 1901, 2195; 1911, 2166.

MELROSE. A city, including the villages of Melrose Highlands, Fells, and Wyoming, in Middlesex Co., Mass., 7 miles north of Boston, on the Boston and Maine Railroad (Map: Massachusetts, E 3). It is an attractive and popular residential suburb of Boston, has a public library, hospital, and public parks, and engages in some manufacturing, the principal products being rubber boots and shoes. Noteworthy features are Middlesex Fells, a State reservation of 1800 acres, and a large natural reservoir, Spot Pond. The government is administered, under the charter of 1900, by a mayor, annually elected, and a board of aldermen, one-third of whose members are elected at large. The board elects the city clerk, treasurer, auditor, and collector, and confirms the executive's nominations of other subordinate officials. The school board is independently chosen by popular vote. Pop., 1900, 12,962; 1910, 15,715; 1914, 16,887; 1920, 18,204. Melrose was settled probably as early as 1633, and formed a part of Charlestown until 1649, and of Malden from 1649 until Melrose was incorporated in 1850. In 1900 it received a city charter. Consult S. A. Drake, *History of Middlesex County*, vol. ii (Boston, 1880), and E. H. Goss, *History of Melrose* (Melrose, 1902).

MELROSE. A city in Stearns Co., Minn., 100 miles northwest of St. Paul, on the Great Northern Railroad (Map: Minnesota, C 5). There are granite works, flour and planing mills, and a brewery. The water works and electric-light plant are owned and operated by the city. Pop., 1900, 1768; 1910, 2591.

MELROSE PARK. A village in Cook Co., Ill., 12 miles west of Chicago, on the Chicago and Northwestern and the Indiana Harbor Belt railroads (Map: Illinois, J 2). It is a residential place, but has some industries, including the manufacture of malleable iron and milk cans and the quarrying of stone. There are municipal water works. Pop., 1900, 2592; 1910, 4806.

MELSTED, mēl'stēd, HENNING FINNE VON (1875-). A Swedish author, born in Stockholm. He was educated there and at Upsala, practiced law, traveled in England, Germany, France, Spain, and Italy, and then turned to literature. After two anonymous stories, *Georg Dahna* (1898) and *Leo Dahna* (1899), his collection of tales, *Noveller i dialog* (1901), attracted attention, as did the drama *Starkare än Lifvet—Brottningar* (1902) and the romances *Kärleksresa* (1902), *Stormtider* (1903), and *Nöd* (1904), a novel. He wrote also the romances *Kvinnoöden* (1905), describing life among the higher classes in Stockholm; *Fantomen* (1906); *Milla* (1907); *Fariséens hustru* (1908); *Pas-sionsnoveller* (1908); *Damen utan nåd* (1909); *Juristerna* (1910), describing Swedish sentiment in the crisis of 1905. Melsted is considered one of the ablest prose writers of modern Sweden.

MELTING POINT. The temperature at which a given substance passes from the solid into the liquid state. Different substances generally have different melting points. Thus, mercury if solidified by cold would melt at a

temperature of 40° below 0° C. (−40° F.); ordinary ice (see ICE) melts at 0° C. (32° F.); sulphur at 115° C. (239° F.); tin at 230° C. (446° F.); lead at 324° C. (615° F.); zinc at 418° C. (784° F.); aluminium at 727° C. (1341° F.); silver at 968° C. (1774° F.); gold at 1072° C. (1862° F.); copper at 1082° C. (1980° F.); pure iron at 1505° C. (2741° F.); platinum at 1777° C. (3231° F.); etc. The presence of more or less impurity in a given substance generally causes a corresponding depression of its melting point, and hence the latter is often determined when it is required to ascertain whether a

MELTING-POINT APPARATUS.

given substance, especially a carbon compound of known melting point, is perfectly pure. Such determinations may be conveniently carried out by means of the apparatus shown in the accompanying figure.

The apparatus consists of an ordinary round-

bottomed flask of about 250 cubic centimeters' capacity, with the greater part of the neck cut off; in this is an ordinary test tube widened in one place so as to be readily held by the flask without touching its bottom; both contain, to about the same level, some liquid (say, strong sulphuric acid) that may be heated to a somewhat high temperature without boiling. To carry out a determination, a small amount of the given substance is introduced into a capillary tube of glass, the latter is tied on to a thermometer so that the substance is very near the mercury bulb, the thermometer with the capillary tube is immersed in the liquid of the test tube, the temperature is allowed to rise very slowly, and the point is carefully noted at which the contents of the capillary tube begin to change color and become transparent. For very precise determinations, however, this method should not be employed. Instead, the investigator uses much larger quantities of substance, reduces the latter to a fine powder, and immerses the thermometer directly into it. While it is known that different modifications of one and the same chemical substance may have different melting points, and hence the melting point cannot be considered as strictly characteristic of a given chemical species, it is so easy to determine with great precision, that it is considered as one of the most useful constants and is very frequently employed by chemists for the purpose of identifying substances and, as already mentioned, for the purpose of testing their purity. Further, in spite of but too many exceptions, certain interesting relations have been shown beyond doubt to exist between the melting points of organic substances and their molecular weights and constitution. See article BOILING POINT.

Under FREEZING POINT that point has been defined with reference to the vapor tension of the given substance in the solid and liquid states. The same definition, and for precisely the same reasons, is of course applicable to the melting point. Concerning the "latent heat of fusion," see FREEZING MIXTURES; HEAT.

Influence of External Pressure on Melting Points. Strictly speaking, the melting point of a solid substance, just as the boiling point (q.v.) of a liquid, depends upon the external pressure. In the case of the melting point, however, the influence exercised by the external pressure is so slight that it may generally be safely left out of account altogether. The subject was first theoretically investigated, from the standpoint of thermodynamics, by James Thomson, and later by Clausius, who found that for a given substance the change of melting temperature caused by an increase of one atmosphere in pressure must be represented by the formula,

$$\frac{T(V - V')}{r},$$

where T denotes the melting point (on the absolute scale, i.e., the centigrade temperature increased by 273) corresponding to some given pressure; V denotes the volume occupied by one gram of the liquid substance at the melting temperature; V' denotes the volume occupied by one gram of the solid substance at the same temperature; and r denotes the mechanical equivalent (in terms of "liter atmospheres") of the heat absorbed, at the same temperature, during the melting of one gram of the substance. (By a "liter atmosphere" is meant the minimum mechanical work required to cause a diminution of

one liter in any volume against the constant resistance of a pressure of one atmosphere.) It will be observed that if V is greater than V' , i.e., if the melting is accompanied by an increase in volume, the above expression is positive, and hence an increase of pressure causes the melting temperature to rise. On the contrary, if V' is greater than V , the expression is negative, and hence an increase of pressure causes the melting temperature to fall. These theoretical results are in perfect agreement with experimental observation. In the case of ordinary ice, melting is accompanied by a contraction in volume, i.e., V' is greater than V , and the above formula leads to the result that while under normal atmospheric pressure ice melts at 0°C . (32°F .), the melting point under a pressure of two atmospheres would be -0.0074°C . (31.9867°F .). As far back as 1851 William Thomson (Lord Kelvin) obtained practically the same result by direct observation, and the formula has since been found to hold similarly good in the case of other substances examined.

It must be observed that the Thomson-Clausius formula correlates the *change* of melting point with the *change* of external pressure. In recent years Rosanoff discovered an equation correlating the melting point itself and the external pressure itself. According to this equation the melting point of ordinary ice, e.g., would be reduced to -5°C . ($+23^\circ \text{F}$.) by a pressure of 615.2 kilograms per square centimeter. Experimentally, Tammann found that ice melted at -5°C . under a pressure of 615 kilograms.

The melting point is generally also affected by the state of subdivision of the solid—the smaller the particles, the lower the melting point. In 1909 Pavloff established a mathematical relationship between the melting point of a substance and the diameter of its particles.

Eutectic Mixtures. It was shown in the article FREEZING POINT that if a solution happens to be saturated at its freezing point, the solid gradually separating out by freezing and the liquid remaining unfrozen cannot but have the same composition, and hence the freezing temperature must remain constant. It is perfectly obvious that the solid mixture thus obtained must entirely melt at the same constant temperature. Mixtures of salts thus obtained from solutions are termed cryohydrates. More generally, and whatever its origin, a mechanical mixture that melts at a constant temperature lower than that of any other mixture of the same substances is termed a eutectic mixture. Following are a few examples of eutectic alloys: an alloy containing 55.58 per cent of bismuth and 44.42 per cent of lead melts at the constant temperature of 122.7°C . (252.86°F .); an alloy of 46.70 per cent of bismuth and 53.30 per cent of tin melts at 133°C . (271.4°F .); an alloy of 59.19 per cent of bismuth and 40.81 per cent of cadmium melts at 144°C . (291.2°F .); an alloy of 92.85 per cent of bismuth and 7.15 per cent of zinc melts at 248°C . (478.4°F .); an alloy of 47.75 per cent of bismuth, 18.39 per cent of lead, 13.31 per cent of cadmium, and 20.55 per cent of tin melts at 71°C . (159.8°F .). See FREEZING POINT; FUSIBLE METALS; PHASE RULE.

MELTON-MOWBRAY, mēl'ton mō'brā. An urban district and market town in Leicestershire, England, 14 miles northeast of Leicester, in the valley of the Eye, near its junction with the Wreak (Map: England, F 4). It has a fine

early English parish church and is famous for its Stilton cheese and pork pies. It has large quarries of iron ore, smelting furnaces, and an important cattle market. It is the Midlands "metropolis of fox hunting," with numerous hunting seats, and in the winter is crowded with sportsmen. It is a very ancient town, being called in the Domesday Book *Medeltune*. In 1644 it was the scene of a defeat and slaughter of the Parliamentarians. Pop., 1901, 7454; 1911, 9202.

MELTZER, mēlts'ēr, SAMUEL JAMES (1851–1920). An American physiologist. Born in Russia, he was educated at Königsberg, Prussia; studied philosophy and medicine at the University of Berlin (M.D., 1882); and in the following year he emigrated to the United States, where he practiced his profession in New York City, serving as consulting physician to Harlem Hospital. In 1906 he became head of the department of physiology and pharmacology in the Rockefeller Institute for Medical Research. He served as president of the Harvey Society, of the Association for the Advancement of Clinical Research in 1909, and of the Association of American Physiologists in 1915.

MELUN, me-lēn'. The capital of the Department of Seine-et-Marne, France, built on an island and on both banks of the Seine, 28 miles southeast of Paris (Map: France, N., H 4). It has an eleventh-century church, a communal college, normal school, and several learned societies. The town is an important railroad centre. The manufactures are carriages, cotton and woolen goods, earthenware, chocolate, agricultural tools, furs, lumber, and cement; and there is trade in grain, flour, cattle, and poultry. Pop. (commune), 1901, 13,059; 1911, 14,861. Melun was taken five times during the ninth century by the Northmen. It fell into the hands of the English in 1419, but they were driven out by Joan of Arc in 1430.

MEL'USINA. A powerful water fairy, half woman and half fish, in French folklore. She became the wife of Count Raymond of Poitiers and built a castle which from her own name was called Lusinia, the present Lusignan. When her husband surprised her in her double form in the bath she disappeared. When the death of a member of the family or of the King of France was about to occur she appeared in a high tower of the castle, in mourning garments, and announced the approaching event by three shrill cries. The legend was used in 1387 by Jean d'Arras as the basis of a romance, which was rendered into French verse by Condolette in 1401, and in translations and other forms made the character of Melusina famous. Consult: Kohler, *Der Ursprung der Melusinsage* (Leipzig, 1895); Roy, *Melusine* (1898); Leo Desaiivre, "Notes sur Melusine," in *Bulletin de la Société des antiques de l'Ouest* (Poitiers, 1899); Baudot, *Les princesses Yolande et les ducs de Bar* (Paris, 1900); E. S. Hartland, "Romance of Melusine," in *Folk-lore*, vol. xxiv (London, 1913).

MEL'VILLE, or **MELVILL**, ANDREW (1545–1622). A Scottish reformer. He was born Aug. 1, 1545, at Baldovie, near Montrose, Forfarshire. In 1580 he was chosen principal of St. Mary's College, St. Andrews. In 1582 he preached the opening sermon before the General Assembly and boldly "inveighed against the bloody knife of absolute authority, whereby men intended to pull the crown off Christ's head

and to wring the sceptre out of his hand." The Assembly applauded his intrepidity, drew up a remonstrance in a similar spirit, and appointed Melville and others to present it. In 1584 Melville was summoned before the Privy Council. He maintained that whatever a preacher might say in the pulpit, even if it should be called treason, he was not bound to answer for in a civil court, until he had been first tried in a church court. For this denial of secular jurisdiction he was condemned to imprisonment, but escaped to London, where he remained till the downfall of Arran in the following year. After an absence of 20 months he returned to Scotland and resumed his office at St. Andrews. In 1606 Melville was called to England to attend the famous conference at Hampton Court. Having ridiculed the service in the Chapel Royal in a Latin epigram, he was twice summoned before the English Privy Council, and on the second occasion his temper gave way and he broke out into a torrent of invective against the Archbishop of Canterbury for encouraging popery and superstition, profaning the Sabbath, etc. The King immediately sent him to the Tower, where he remained for more than four years. In 1611 he was released on the solicitation of the Duke of Bouillon, who wanted his services as a professor in his university at Sedan in France, where he spent most of his remaining years. Melville died at Sedan, in 1622, but neither the exact date of his death nor the events of his last years are ascertained. He published much in prose and verse, in Latin and English. Consult his *Life* by McCrie (2 vols., London, 1819; rev. ed., 1856), and W. L. Mathieson, *Politics and Religion: A Study in Scottish History, 1550-1695* (2 vols., New York, 1902).

MELVILLE, GEORGE JOHN WHYTE (1821-78). An English author. He was born near St. Andrews, Scotland, and entered the army in 1839. In 1846 he became captain in the Coldstream Guards and during the Crimean War served as a volunteer in the Turkish cavalry. Melville may be justly regarded as the founder of the fashionable novel of the high-life sporting variety. In describing the hunting field he aroused much interest, as shown by the popularity of his score or more of novels from *Kate Coventry* in 1856 to *Black but Comely* in 1878.

MELVILLE, GEORGE WALLACE (1841-1912). A distinguished American naval officer, engineer, scientist, and polar explorer, born in New York City, Jan. 10, 1841. He was educated in New York and at the Brooklyn Polytechnic Institute, and entered the navy as a third assistant engineer in 1861. He served on the *Dakotah* in the action at Lambert's Point, in the capture of Norfolk, and in the attacks on Drewry's Bluff. Later, he was attached to the *Wachusett* and was commended for his conduct in connection with the capture of the Confederate cruiser *Florida*. In 1873 he volunteered as engineer of the *Tigress* and served on her in the search for the survivors of the *Polaris*. Six years later he volunteered as engineer of the ill-fated *Jeanette*. He commanded one of the three boats after the *Jeanette* sank, and, after a terrible journey of 100 days and 2200 miles, he reached the Lena Delta, the party under his command being the only one that survived. After his arrival he set out on a long search for the other officers and men, but after 23 days illness and bad weather compelled him to

return. Setting out again in the spring, he found the camp and the bodies of his comrades. For his conduct on this expedition he was highly commended by the Navy Department, was given a gold medal by Congress, and by special act promoted to the grade of chief engineer. He again volunteered for the Greely relief expedition and was one of the first to reach the survivors at Cape Sabine. From 1887 to his retirement in 1903 he was engineer in chief of the navy. His services as chief of the Bureau of Steam Engineering for this long period were of the greatest importance, covering nearly all the engineering work in the building of the new navy. He was a strong advocate of high speed in warships, vertical engines instead of horizontal, and was the first to use triple screws in large ships (*Columbia* and *Minneapolis*). He established the engineering experimental station and postgraduate school, and from his long series of experiments with coal and liquid fuel much was learned. He was an early advocate of water-tube boilers, putting them on board the *Monterey* in 1889, but opposed their general use until suitable types were developed; in the successful development of these he was largely concerned. He received many marks of distinction at home and abroad, including decorations, honorary degrees, and the presidency of the American Society of Mechanical Engineers (1899). By the naval personnel act of 1899 he became a rear admiral, and with that rank he retired in 1903. He died March 17, 1912.

MELVILLE, HERMAN (1819-91). An American novelist, born in New York City and noteworthy for his stories of the sea. He was educated at the Albany Classical School and in New York City, and went to sea in 1837 in a merchant vessel bound for Liverpool. In 1841 he rounded Cape Horn on a whaling cruise, and was so ill treated that in the next year he and a companion made their escape from the ship and were taken captives by the Typees, a warlike tribe of Nukahiva, one of the Marquesas Islands. His companion soon escaped and Melville was finally rescued after four months by the crew of an Australian whaler. He spent the next two years (1842-44) in and about the Pacific Islands, and on his return to New York told the story of his experiences at sea and his romantic captivity in *Typee: A Peep at Polynesian Life during a Four Months' Residence in a Valley of the Marquesas* (1846), which enjoyed a sensational and not undeserved success. In 1847 Melville married the daughter of Chief Justice Lemuel Shaw of Massachusetts. In 1850 he moved with his family to Pittsfield, Mass., but returned in 1863 to New York. There he occupied a place in the customhouse continuously from 1866 till 1885, when because of failing health he resigned. The period of his popularity, embraced in the years 1846-52, was one of rapid production of such stories as *Omoo* (1847); *Mardi* (1848); *Redburn: His First Voyage* (1848); *White Jacket, or the World in a Man of War* (1850), in which the horrors of flogging in the navy were so graphically set forth that the abolition of the practice soon followed; *Moby Dick, or the White Whale* (1851); and *Pierre, or the Ambiguities* (1852). After 1852 he published three other volumes of fiction, *Israel Potter: His Fifty Years of Exile* (1855); *Piazza Tales* (1856); *The Confidence-Man* (1857); and later several books of poems,

lyric and epic, such as *Battle Pieces and Aspects of the War* (1866); *Clarel: A Pilgrimage in the Holy Land* (1876); *John Marr and Other Sailors* (1888); *Timoleon* (1891). His *Typee*, *Omoo*, *Moby Dick*, and *White Jacket* were reedited in 1892 with an introduction by Arthur Stedman.

MELVILLE, SIR JAMES (1535-1617). A Scottish soldier and diplomat. He served under the Constable Montmorenci in Flanders in 1553 and in 1557 was taken prisoner at the battle of St. Quentin. Two years after he obtained his release and was dispatched to Scotland on a secret mission. During his absence occurred the tournament in which Montmorenci killed Henry II; and at Melville's return he judged it best to turn his steps towards Germany, where he was employed by the Elector Palatine. While on a visit to France in 1561 he met Queen Mary of Scotland, to whom he tendered his allegiance and sword. In 1564 he returned to his native land and presented himself to Mary at Perth. Shortly afterward he was sent to England as ambassador to Queen Elizabeth. Again in 1566 he was sent to England to bear the news of the birth of an heir to the Scottish throne. He adhered to the Queen so long as there appeared to be any hope of her ultimate success, but after she was committed to Lochleven Castle, was sent by the nobles to offer the regency to the Earl of Murray. During Morton's regency he retired from court, but when James began to reign was received with favor. He was knighted and appointed Privy Councilor and gentleman of the bedchamber to Queen Anne. On James's accession to the English throne, Melville retired into private life and died at Hallhill, Nov. 13, 1617. *The Memoirs of Sir James Melvil of Hallhill; Containing an Impartial Account of the most Remarkable Affairs of State during the Last Age, etc.*, accidentally discovered in Edinburgh Castle in 1660, were published in 1683 by his grandson, George Scott, but in an incomplete form. An accurate edition was printed in 1827-33 at Edinburgh, by the Bannatyne Club, and is of great historic value. Consult J. H. Burton, *The History of Scotland* (Edinburgh, 1867-70).

MELVILLE, JAMES (1556-1614). A Scottish reformer, nephew of Andrew Melville. He was born at Mayton, near Montrose, and graduated B.A. at St. Andrews in 1571. He was professor at Glasgow (1575-80) and at St. Andrews (1580-84), but in 1584 was compelled by Bishop Adamson to follow his uncle in flight to Berwick. In the following year he returned to Scotland, renewing his quarrels with the Bishop. In 1586 he was ordained to the Presbyterian ministry. James VI made him vicar of Abercrombie and in 1589 Melville was chosen moderator of the General Assembly. After James became King of England he detained Melville at Newcastle-on-Tyne because of his refusal to support episcopacy, although high honors were promised him if he would take the King's side. His published works include prose and poetry, but his diary (1556-1610), printed by the Woodrow Society (Edinburgh, 1842), is especially valuable as a source for the ecclesiastical history of the time.

MELVILLE, LEWIS. The pen name of LEWIS S. BENJAMIN (q.v.).

MELVILLE, VISCOUNT. A British statesman. See DUNDAS, HENRY.

MELVILLE ISLAND. One of the Parry Vol. XV.—25

Islands of Arctic North America, situated in lat. 74° to 77° N., north of Melville Sound and between Bathurst and Prince Patrick Islands, the latter being the westernmost island of the group (Map: America, North, G 2). Melville Island is very irregular in outline, 200 miles long and about 100 miles broad, it is of carboniferous lime and sandstone formation, and contains coal beds. It was discovered by Parry, who wintered there (1819-20). Although several times skirted by sledge parties (1853-55) during the Franklin relief search, it has been visited by only one other ship, the *Arctic*, under Bernier in the Canadian expedition (1908-09). He wintered there and examined fully the resources of Melville and other adjacent islands.

MELVILLE PENINSULA. A projection of the north shore of North America, extending north of Hudson Bay, and belonging to the Canadian Territory of Keewatin (Map: America, North, K 3). It is connected with the mainland by Rae Isthmus, and bounded on the west by Committee Bay, discoveries which were made by Dr. John Rae in 1846. It is separated from Cockburn Island on the north by Fury and Hecla Strait, from Baffin Land on the east by Fox Channel, and from Southampton Island on the south by Frozen Strait.

MELVILLE SOUND. One of the numerous passages between the islands of Arctic North America (Map: America, North, H 2). It lies between Melville Island on the north and Prince Albert Land on the south, and extends from Prince of Wales Island in the east, where it communicates through Barrow Strait and Lancaster Sound with Baffin Bay, to Banks Land in the west, where Banks Strait opens into the Arctic Ocean. Its length is 225 miles and its width is from 50 to about 175 miles. Its southern extent was largely unknown until Hansen, of Amundsen's expedition, extended the coast of Victoria Land northwest to Cape Nansen, calling the new regions King Haakon VII Land (1903-04). From Cape Nansen to Glenelg Bay the exact outlines are yet unknown.

MEMBERED (from *member*, OF., Fr. *membre*, from Lat. *membrum*, limb). A term in heraldry applied to a bird having its beak and legs of a different color from its body; it is then said to be membered of that color.

MEMBRANA PUPILLARIS (Lat., pupillary membrane). The name given to a very thin membrane which closes or covers the central aperture of the iris in the fetus during an early period of gestation; it begins to disappear in the seventh month.

MEMBRANE (Lat. *membrana*, from *membrum*, limb), IN ANATOMY. The term applied to those textures of the animal body which are arranged in the form of laminae and cover organs, or line the interior of cavities, or take part in the formation of the walls of canals or tubes. The structure and special uses of some of the most important of the animal membranes are noticed in separate articles, such as MUCOUS MEMBRANE, SEROUS MEMBRANE, ETC.; and the membranes in which the fetus is inclosed—commonly called the fetal membranes—are described in the article PLACENTA. Bowman's membrane and Descemet's membrane are special structures, being respectively the second and fourth layers of the cornea. (See EYE.) The membranes which cover and protect the brain and spinal cord are commonly termed *meninges*, from the

Greek word *meninx*, a membrane. Simple membranes are of three kinds—mucous, serous, and fibrous. Mucous membranes line the cavities which communicate externally with the skin, as the mouth, intestinal canal, genito-urinary passages, internal surface of the eyelids, and the ramifications of the respiratory passages, the Eustachian tubes, and middle ear. Mucous membrane has three layers: a fibrovascular layer, composed of blood vessels, nerves, and connective tissue, which is continuous with the tissue beneath and interlacing with it; a more superficial layer, called basement membrane, which is described as structureless, and upon which rests the superficial layer, or epithelium, the latter presenting a variety of structure in different parts of the body. This membrane is at times elevated into papillæ or villi, or else depressed in the form of glands. The mucous membranes secrete mucus to lubricate the various passages, and also other fluids for special physiological purposes. The saliva, the gastric and pancreatic juices which aid digestion, are examples of special secretions. The serous membranes are of two kinds: those lining visceral cavities, such as the pericardium, pleuræ, and peritoneum; and those lining joint cavities (synovial membranes). A third species of simple membrane is the fibrous, divided into two kinds—enveloping aponeuroses, the fibrous capsules of joints and the sheaths of tendons; and the enveloping membrane of bone, the periosteum, the dura mater (the internal periosteum of the skull), the fibrous membrane of the spleen and of other glandular organs. See SPLEEN.

MEMBRÉ, măn'bră', ZENOBIOUS (1645–87). An early missionary to Canada, born at Bapaume, France. He became a Recollect of the Franciscan Order and went as a missionary to Canada in 1675; accompanied La Salle upon his expedition to the Mississippi in 1679, stopping at Fort Crèvecoeur, on Lake Peoria, where, with Father Gabriel de la Ribourde, he conducted a mission among the Illinois until driven by the Iroquois to the Jesuit settlement at Green Bay. He descended the Mississippi with La Salle in 1682 and returned the same year to France, where he published an account of the expedition. After acting for a time as warden of a convent at Bapaume he came again to America with La Salle in his final expedition by sea to Texas in 1684, and remained in Fort St. Louis, where, with his companions, he was massacred by the Indians. Consult J. D. G. Shea, *Discovery and Exploration of the Mississippi Valley* (2d ed., Albany, 1903).

MEMEL, mă'mel. A river emptying into the Baltic. See NIEMEN.

MEMEL. A seaport town of Prussia, in the Province of East Prussia, the most northern town of Germany, situated near the Russian border at the entrance of the Dange into the north end of the Kurisches Haff, 58 miles by rail north-northwest of Tilsit (Map: Germany, J 1). It has an excellent harbor protected by two lighthouses and a fort, and is of great importance in the Baltic lumber trade. The logs, sawed in the local mills, are brought down from the forests of Russia by the König Wilhelm Canal and by the Niemen, here known as the Memel. Memel manufactures machinery, soap, amber, celluloid, cigarettes, vinegar, and rope, and has trade in agricultural products imported from Lithuania, coal, petroleum, herrings, and local manufactures. It has several dry docks.

The educational institutions include a Gymnasium, a seminary for teachers, and a school of navigation. Memel was founded in 1252 by the Teutonic Order. It joined the Hanseatic League in 1254 and soon rose to a position of considerable commercial importance. It was held by the Swedes for some time during the seventeenth century, was taken by the Russians in 1757, and was the residence of Frederick William III after the battle of Jena in 1807. Here also, in 1807, a treaty of peace was concluded between England and Prussia. It was again seized by Russia in 1812. Memel was occupied for the third time by the Russians in the European War which broke out in 1914. They were forced to retire when the Germans brought up superior forces. See WAR IN EUROPE. Pop., 1910, 21,470, chiefly Protestants.

MEMLING, mēm'ling, or **MEMLINC**, HANS (c.1430–94). One of the most eminent painters of the early Netherlands school. According to the best available evidence he was born at Mönlingen, near Aschaffenburg, Bavaria, and appears permanently settled in Bruges in 1478, although he was probably active there some years earlier. On the evidence of two documents, which do not, however, prove the supposition, he is said to have been the pupil of Rogier van der Weyden. But his work bears little resemblance to that master's. His earlier paintings, in particular a triptych (c.1468) belonging to the Duke of Devonshire at Chatsworth, and "St. John the Baptist" and "St. Lawrence" in the National Gallery, London, show rather the influence of Dierick Bouts. As his name never appears in the painters' guild at Bruges, he is thought to have been employed in the service of Charles the Bold, Duke of Burgundy, which would have exempted him from registering. He attained a reputation far beyond Bruges, his pictures being bought by the Medici in Florence and by Cardinals Grimani and Bembo in Venice, as well as in England, France, and Spain. That he enjoyed material prosperity is evident from his subscription to the war loan of Emperor Maximilian and from the terms of his testament.

Memling's works, of which a large number survive, may be best studied at Bruges, especially in the Hospital of St. John. One of the most important there is a magnificent though somewhat damaged altarpiece representing in the centre the "Marriage of St. Catharine," with the two St. Johns and St. Barbara, and, on the wings, the "Death of John the Baptist" and "St. John's Vision at Patmos." To the same year (1479) belongs the triptych known as the Floreins altarpiece, representing the "Adoration of the Magi" and the "Presentation in the Temple." Other important works in the Hospital of St. John are a diptych (1487) with the Madonna, and on the other wing the donor, Martin van Nieuwenhoven, one of the best of Memling's portraits, and the "Shrine of St. Ursula" (1489), a reliquary in the shape of a Gothic chapel. Its 14 scenes are remarkable for the freedom and grace with which he has treated groups and figures of small proportions, but some are probably the work of pupils. A triptych (1484) with "St. Christopher and the Infant Christ" in the centre, in the Museum at Bruges, also ranks high among his works. The Museum at Brussels possesses a fine "Crucifixion" and that of Antwerp a large and magnificent triptych, once in the church of Najara. The latter, executed in collaboration with pupils, represents "Christ

as the King of Heaven," surrounded by 12 beautiful angels making music on the different instruments used in that day. Other celebrated pictures by Memling are: a triptych containing more than 200 figures, the centre occupied by the Crucifixion (1491), in the cathedral at Lübeck, in which he was aided by his pupils; the "Seven Joys of the Virgin" (1480), in the Pinakothek, Munich; the "Seven Sorrows of the Virgin," in the Gallery of Turin; the Madonnas in the Uffizi, Florence, the Louvre, the Berlin Museum, and the National Gallery, London; a large altarpiece with the "Last Judgment" (1470-77), in the church of St. Mary at Danzig, one of the best of his early works. The Metropolitan Museum of New York possesses in the Altman collection a smaller and more intimate version of the "Betrothal of St. Catharine," besides a fine portrait of an unknown old man and portraits of Tommaso Portinari and his wife. Other fine examples of his portraits are those of the Burgomaster Moreel, his wife and daughter (the so-called "Sibylla Zambetha"), in the Brussels Museum; the "Old Canon," at Antwerp; and other examples at Frankfurt and Florence. Memling was, along with Gerard David, the most important master of the Flemish school during the late fifteenth century.

Bibliography. Michiels, *Memling, sa vie et ses ouvrages* (Verviers, 1883); Wauters, *Sept études pour servir à l'histoire de Hans Memling* (Brussels, 1894). Good brief works are: Kaemmerer, *Memling* (Bielefeld, 1899); Böck, *Memling-Studien* (Düsseldorf, 1900); Gaederiz, *Der Altarschrein von Hans Memling in Dom zu Lübeck* (Leipzig, 1901); *Masters in Art*, vol. vi (Boston, 1905), containing an exhaustive bibliography; Voll, *Altniederländische Malerei* (Leipzig, 1906); Fierens-Gevaert, *Les primitifs flamands* (Brussels, 1909); Weale, *J. C. Memling* (New York, 1909).

MEMMI, mēm'mě, SIMONE. See MARTINI, SIMONE.

MEMMINGEN, mēm'ing-en. An ancient town of the Kingdom of Bavaria, Germany, situated on the river Ach, a tributary of the Iller, 33 miles south-southeast of Ulm (Map: Germany, D 5). It is still partly surrounded with walls, and its church of St. Martin has fine late Gothic choir stalls dating from the fifteenth century. The Roman Catholic church with its fine altarpieces, the sixteenth-century Renaissance Rathaus, and the Fuggerbau, in which Wallenstein received his dismissal from the command of the army in 1630, are also noteworthy. The educational institutions of the town include a Realschule, a seminary for teachers, a theatre, a museum, and a library, with an important collection of archives. Memmingen manufactures woollens and linen, cordage, machinery, fertilizer, fire extinguishers, iron goods, leather, soap, and there are foundries for large bells and structural steel. There is a good trade in agricultural products, hops, cheese, wool, and live stock. The town is first mentioned in 1010 and became a free city of the Empire in 1286. It was a member of the Schmalkalden League; it became Bavarian in 1802. Pop., 1910, 12,362.

MEMMINGER, mēm'in-jēr, CHRISTOPHER GUSTAVUS (1803-88). An American political leader, Secretary of the Treasury in the government of the Confederate States. He was born in Württemberg, Germany, but was brought at an early age to South Carolina by his mother, who died not long after their arrival. He was

for a time in an orphan asylum in Charleston, and was then adopted by Governor Thomas Bennett. Memminger graduated from South Carolina College in 1820, studied law, and practiced in Charleston. He was an opponent of Calhoun and in 1832 wrote the *Book of Nullification*, a satire in biblical style upon that leader's favorite doctrine. He was for many years a member of the State Legislature, and for nearly 20 years was the head of the finance committee. He was one of the first to plan for the organization of a system of public schools in South Carolina. In January, 1860, he was sent as a special commissioner to Virginia in order to induce that State to participate in a scheme for obtaining redress of Southern grievances. Some months later he was one of the leaders in the convention which declared that the connection of South Carolina with the United States was dissolved. Upon the formation of the Confederacy he was made Secretary of the Treasury, which office he held until June, 1864, when he resigned. He failed to display sufficient capacity to cope with the difficulties that beset the financial policy of the Confederate government. For an account of his administration, consult J. C. Schwab, *The Confederate States of America, 1861-65: A Financial and Industrial History of the South during the Civil War* (New York, 1901).

MEM'NON (Lat., from Gk. Μῆμνων). In Greek legend, a son of Tithonus and Eos (the dawn), King of the Ethiopians, who led an army to aid his uncle, Priam, King of Troy, after the death of Hector. Clad in armor made by Hephaestus (or Vulcan), he made great slaughter among the Greeks, and finally killed Antiochus, who was defending his father, Nestor. Over the body of Antiochus he met Achilles and fell before him. His mother by her tears obtained from Zeus his immortality, and his body or, in another story, his ashes were carried to his native country. The river Paphlagonius was said to flow blood yearly on the anniversary of his death. His comrades were changed to birds, and it was said they returned yearly from the south and fought around the funeral mound erected for their leader at Troy. In the earlier writers Memnon leads his forces from the extreme East, or Assyria; later his native land was sought in Syria, and not earlier than the end of the fifth century B.C. was it localized in Egypt and Æthiopia. Memnonia (see MEMNONIUM) were said to exist at Susa in Persia and at Abydos and Thebes in Egypt. Indeed, in Ptolemaic times the west bank of the Nile at Thebes was the Memnonium, as the east was Diospolis. Near by are two colossal statues of King Amenophis III (q.v.) of the eighteenth dynasty, the southern one of which was said to give forth a sound when struck by the rays of the rising sun, a sound probably due to the sudden expansion of the sandstone conglomerate from which the statue is hewn, and the consequent passage of air through the pores of the stone. Consult J. B. Mayor's note on *Juvenal*, 15, 5, in his edition of *Juvenal* (London, 1888). Strabo (c.20 B.C.) does not mention the name of Memnon in describing this phenomenon, but early in the first century of our era the story gained currency that the statue represented Memnon, who thus greeted his mother in the morning. From the time of the Flavian emperors to that of Septimius Severus the world seems to have been fond of visiting this place, and the sides of the figure are covered with names and verses re-

ferring to the legend. Among the visitors were Hadrian and his wife, Sabina, in 130 A.D. At some time before Strabo's visit the upper part of the statue had been overthrown by an earthquake (popular tradition said by Cambyases); when the statue was rebuilt by Severus the sounds ceased.

Memnon has been regarded by many scholars as properly a solar deity. In art the combat of Memnon and Achilles in presence of Eos and Thetis, and the removal of the body of Memnon by his mother or by sleep and death, were favorite subjects with the Attic vase painters. Memnon figured largely also in the writings of the cyclic poets (q.v.), especially in the *Æthiopis* of Arctinus: for this poem consult Monro's edition of the *Odyssey*, books xiii-xxiv (Oxford, 1901). The chief ancient source, however, is the *Post-homerica* of Quintus Smyrnaeus. Consult: Friedrich Jacobs, *Ueber die Gräber des Memnon* (Munich, 1830); Thirlwall, in *Philological Museum* (Cambridge, 1832); J. A. Letronne, "La statue vocale de Memnon," in *Mémoires de l'Institut Royal de France* (Paris, 1833); Curzon, in *Edinburgh Review* (Edinburgh, 1886); the article "Memnon" in W. H. Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. ii (Leipzig, 1890-97).

MEMNONIUM (Lat., from Gk. *Μεμνόνιον*). The name applied in Ptolemaic times to an Egyptian temple about 8½ miles from the Nile, near Abydos. The geographer Strabo (c.30 B.C.) mentions it with admiration and compares it with the celebrated Labyrinth (q.v.). In 1859 Mariette, with the financial aid of the Egyptian government, cleared away the sand and rubbish which covered the building and made it accessible to visitors and students. The temple, begun by Seti I, and completed by his son, Ramses II, was dedicated to the gods of Abydos and to the manes of Seti and of his predecessors on the throne of Egypt. Among the numerous reliefs that adorn its walls are some of the finest specimens of Egyptian sculpture. The most important are in a long gallery known as the Gallery of Kings. On the right wall of this room are depicted King Seti I and his son Ramses adoring their royal ancestors whose cartouches are inscribed in two long lines. The list contains the names of 76 kings of Egypt, beginning with Menes (q.v.) and ending with Seti I (q.v.), but it is far from complete. It does not contain the names of monarchs regarded as illegitimate or unimportant, and it omits all the rulers from the thirteenth to the seventeenth dynasty. Copies of the list are to be found in Meyer, *Geschichte des alten Aegyptens* (Berlin, 1887), and in W. M. F. Petrie, *A History of Egypt* (New York, 1897). Similar lists exist at Karnak and at Sakkarah (q.v.). Consult: A. E. Mariette, *Abydos* (Paris, 1869-80); id., *The Monuments of Upper Egypt* (London, 1877; rev. by L. Dickerman, Boston, 1890); Baedeker, *Egypt and the Sūdān* (7th ed., Leipzig, 1914).

MEMORABILIA (Lat., memorable things). Something worthy of being remembered or noted down, especially the Latin title of *Memoirs of Socrates*, by Xenophon (q.v.).

MEMORIAL ARCH. See ARCH, TRIUMPHAL, or MEMORIAL.

MEMORIAL ARCHITECTURE. In all ages men have sought to preserve the memory of their own transitory lives and deeds by the erection of cairns, mounds, pillars, tombs, and other structures capable of defying the destroy-

ing power of time. (Consult Gen. xxviii. 18; Josh. iv. 3-9; see also MEGALITHIC MONUMENTS; OBELISK; PYRAMID.) With the progress of art such monuments took on forms of greater elegance and complexity. The Assyrians set up inscribed stelæ; that of Shalmaneser, a square shaft of black basalt inscribed on all four faces, is in the British Museum. The commemorative stelæ and sculptured gravestones of the Greeks were of moderate size but of great beauty of form and execution. The Roman pride of conquest and love of grandeur led to the development of two forms of memorial which have continued to be used or imitated down to modern times—the arch and the column. The Roman triumphal arches were erected to commemorate victories; of these, three of the most famous are in Rome, those of Titus, of Septimius Severus, and of Constantine; other celebrated examples are at Ancona and Benevento in Italy, Rheims and Orange in France, Baalbek in Syria, in Africa, Spain, etc. (See ARCH, TRIUMPHAL.) Memorial columns were erected for a like purpose, usually of the Doric or Corinthian order, and of imposing size, sometimes in reality towers in the form of columns, as the columns of Trajan and of Marcus Aurelius at Rome, covered with reliefs in ascending spirals depicting their campaigns. (See COLUMN; ANTONINE COLUMN; TRAJAN'S COLUMN.) Both these kinds of memorial have been often imitated in modern times. Among modern arches are those erected by or in honor of Napoleon in Paris—Arch of the Carrousel, Arc de l'Etoile; the Arch of Peace at Milan, the Washington Arch (New York) and Soldiers' and Sailors' Memorial Arch in Brooklyn (N. Y.); and the Brandenburger Thor, Berlin—not an arch, properly speaking, but a triumphal gateway. Among modern columns two of the most beautiful and famous are in Paris—the Colonne Vendôme in the square of that name (see VENDÔME) and the Colonne de Juillet on the site of the Bastille. (See COLUMN, Plate, Fig. 17.) In memory of the victory of Commodore Perry on Lake Erie a lofty Doric column was being erected in 1915.

Modern memorial structures other than obelisks, statues or groups (see SCULPTURE), tombs, arches, and columns are of very varied kinds. Churches, hospitals, chapels, homes, and libraries are often built as memorials, e.g., the Crimean Memorial Church at Constantinople, the Rylands Memorial Library at Manchester (England), Memorial Hall of Harvard University, etc. The Ruhmeshalle at Munich and the Hall of Fame of New York University are galleries to commemorate the great men of Bavaria and of the United States respectively. The Soldiers' and Sailors' Memorial at New York is a lofty temple-like circular edifice. The Lincoln Memorial now (1915) under erection at Washington, D. C., is a severe and stately Doric hall. The Champlain Memorial at Crown Point, N. Y., is in the form of a government lighthouse. Memorial halls often take the form of historic museums containing documents and objects of historic interest associated with the person or event commemorated. The mere enumeration of the varieties of memorial buildings, monuments, parks, and decorations would require several pages. Next to religion, commemoration offers the highest inspiration and the widest opportunity to artistic creativeness, both for the architect and the sculptor; for except in the case of purely sculptural monuments and of utilitarian build-

ings erected as memorials, both these arts must be associated in order to secure the highest results. See MAUSOLEUM; MONUMENT; TOMB.

MEMORIAL CROSS. See CROSS.

MEMORIAL DAY. See DECORATION DAY.

MEM'ORY (OF. *memorie*, *memore*, *memoire*, Fr. *mémoire*, from Lat. *memoria*, from *memor*, mindful; connected with Gk. *μῆμῆρος*, *mermeros*, anxious, Skt. *smar*, to remember). The conscious representation of past experience. To say that a man has a good memory means that he is able to recall past events fully and accurately. The term is also used, more broadly and loosely, to include the capacity of retention. Thus memory is figuratively called a storehouse. This implies that within memory are preserved bits of experience which may reappear in consciousness from time to time in the form of recollections. It is well to keep distinct the terms "retention," which properly considered is a physiological fact, a matter of cerebral mechanics, and "conscious representation," or "recollection"—memory in the strictly psychological sense.

Recollection involves no new or peculiar mental processes. The core of a recollection or a memory, as it may be called, is the memory idea. This may appear either as an image—visual, auditory, tactual, etc. (see IMAGINATION; IMAGE)—or as a word or a series of words. The thing that brands the image or word as a memory idea is, first of all, a feeling of familiarity (see FAMILIARITY). Memory is thus intimately related to recognition, which is likewise characterized by the feeling of familiarity; but it differs from recognition in that the latter has as its content a present perception instead of an idea. In imagination, on the other hand, we find as a characteristic mark the feeling of strangeness or unfamiliarity. Furthermore, a recollection is ordinarily specific; the idea comes not only as familiar but also as specifically placed and dated. These references of place and time are meanings which are themselves represented in consciousness by organic sensations and other associated ideas, and which thus form a further mark of distinction between memory on the one hand and recognition and imagination on the other. It is always necessary to distinguish between the memory idea, as mental process, and the meaning carried by that idea; e.g., the memory idea of the capitol at Washington may be only a vague visual image of the dome, but this image stands for, means, the entire building. (See MEANING.) The failure to draw this distinction has led to misunderstanding of the true nature of memory imagery. Another point to notice is that, with lapse of time, the memory idea is subject to change of various kinds: it tends to fade out completely or to be replaced by typical and habitual images, or, again, to be replaced in part by foreign imaginal contents; so that after an interval, say, of some months or years a memory idea shows in numerous details a lack of correspondence with the original perception. The fading of the memory idea and its filling out with imaginal contents are due, first, to the decay of the impression made on the nervous system, and secondly to a general determining tendency to make a full and complete picture out of a fragmentary one; the same tendency is seen in the reconstruction of dreams after waking, and again in the invention of details to round out a good story. The true memory idea, indeed, is found experimentally to be far less complete, more filmy, of poorer color-

ing, and less stable, than it is commonly thought to be.

There are, in strictness, numerous partial "memories"—auditory, visual, kinæsthetic, etc.—and not one single "memory." Auditory imagery usually occurs in combination with throat kinæsthesia; gustatory and olfactory memories are rare. Since individuals are found to differ as regards the predominant forms of imagery, it has become customary to distinguish memory types and to assign observers accordingly to a visual type, an auditory-kinæsthetic type, a kinæsthetic type, or, if the various forms of imagery appear to be more or less evenly balanced, to a mixed type. These type differences are, however, gross differences; subclasses within type may be distinguished. For example, individuals who are predominantly visual may still differ as regards the prevalence of the spatial and the qualitative attributes: one visualizes forms clearly with poor coloring; another visualizes color with marked fidelity, but outlines with vagueness; and in the same way persons who belong to the auditory type may differ in ability to image pitch, timbre, etc. Furthermore, there are individuals who tend to reduce as many ideas as possible to spatial terms: differences in pitch are visualized in steps, or felt kinæsthetically as up or down; loud tones are near, soft tones are far; short intervals of time are represented as lines of different lengths. It seems, therefore, that we must eventually distinguish "attributive types." But, finally, this whole doctrine of types must not be taken too rigorously. Nervous predisposition, the mode of presentation of the original material, the purpose or intention with which the material is recalled, are all concerned in determining the nature of the imagery that occurs at any one moment; so that the same individual may learn with one form of imagery and recall with another; and a person whose word imagery is auditory-kinæsthetic may recall objects in visual imagery.

Recollection is either active or passive. The effort to "call up" a name or a situation in which a known event occurred is an instance of active recollection; whereas, in passive recollection, memories "come of themselves," as in the case of a reverie or in the successive appearance of the words and music of a remembered song. The former demands active attention, the latter passive. Almost any phase of consciousness may initiate recollection; the perception of a color may do it, or that of a sound, or a shiver of cold, a feeling, a bracing effort, etc. See ASSOCIATION OF IDEAS for the incentives to recollection.

Retention rests upon some modification of the cortex during excitation. The most acceptable theory of retention is the theory of "functional dispositions" (Wundt). Excitation so disposes nerve elements that their functions are more or less permanently altered. In this manner a reexcitation renews a function which has already been impressed upon the nervous substance. The concept of physical memory has been extended to cover all changes in organic matter which outlast the operation of their causes. It is thus made synonymous with physiological habit. See HABIT; DISPOSITION.

Experiment has attacked most of the major problems of memory. Three general methods have been used: (1) reproduction: the observer reproduces, e.g., a line of poetry or a tone that he has heard previously; (2) recognition: e.g.,

a color is shown twice in succession, and the observer reports whether he recognizes it the second time as the same color or whether it looks lighter or greener or paler; (3) comparison: emphasis is laid on the memory image, which is compared with a similar perception. The first important work was done by H. Ebbinghaus in 1885 under the first method. Series of meaningless syllables (e.g., bul, rom, cil) were read over and over, and then an attempt was made to write them from memory. The investigator found that as the interval between learning and reproducing was gradually lengthened, the amount remembered fell off at first rapidly and then more and more slowly. The influence of length of series, order, repetition, rhythm, etc., was also studied. Ebbinghaus' method, which is known as the method of complete mastery, has been repeated with many modifications and improvements in technique. The most important investigator of memory, after Ebbinghaus, is G. E. Müller, who has devised two other methods: the method of retained members, in which the learner is required, after an interval, to reproduce as many syllables as possible without regard to order; and the method of right associates, in which the observer is first required to repeat the syllables in trochaic rhythm (a procedure which breaks up the series into groups of two syllables each) and is then shown the first syllable of a group, with the instruction to respond with the first syllable that comes to mind. The nature of the response and the time elapsing between presentation of stimulus syllable and response are both important for the scoring of the results. Many forms of apparatus have been devised for the

arrangement, the effects of disease, of age, race, and individual differences. The results of the experimental investigations of memory are treated in the articles ASSOCIATION OF IDEAS and LEARNING (qq.v.).

The systematic attempt to improve the efficiency of memory is known as the art of mnemonics, which is said to have originated with the Greek poet Simonides. Most mnemonic devices include the formation of artificial associations as an aid to recollection. A common device for remembering dates, e.g., is the association of the digits with letters. Then the letters corresponding to the figures in a date are brought together in a word which is associated, in turn, with the event whose date is to be retained.

Memory is subject to many disturbances or diseases, most of which fall under the head of amnesia, or loss of memory. Amnesia may be either general or partial. In general amnesia a greater part of memory disappears, (1) temporarily, as in epilepsy, or (2) periodically, as in altered personality, or (3) progressively (e.g., proper names are forgotten before adjectives and verbs). Partial amnesia covers loss of memory for colors, sounds, numbers, proper names, etc. (See APHASIA.) A less frequent disorder of memory is hypermnnesia, or exaltation of memory. A person's general memory, or his memory for a language or for some event of his childhood, is remarkably clarified. Finally come illusions of memory, or paramnesias, in which the subject believes that a new experience has been passed through before (illusion of familiarity), or assigns to a recent date experiences which have occurred at a remote time.

MEMORY IN ANIMALS. The more precise definition of memory as a conscious representation of past experience means that memory is characterized by the free memory idea. The existence in animals of the free idea is, however, doubtful; the evidence which is usually accepted by the layman is by no means unequivocal. In the absence of his master the dog may show signs of grief, but there is no reason to assume that symptoms of grief imply an idea of the master. The unhappiness may be consciously represented without ideation of its cause. Nor does the dog's later recognition of his master imply that he has had his master in mind, any more than recognition in man implies that the

JASTROW'S MEMORY APPARATUS.

From Titchener, *Experimental Psychology*.

(Series of colors or letters are exposed, to be memorized by the observer.)

presentation of the material to be learned; the Jastrow memory apparatus shown in the cut is one of the older and simpler forms. Other subjects related to memory which have been investigated are the character of the stimulus, combination of sense modalities, association and

object recognized has been thought about in its absence. (See RECOGNITION.) The movements that animals make in their sleep, or the sounds that they may then utter, have been taken as evidence of dream imagery; but there is no assurance that such behavior is not entirely reflex, or associated merely with some vague perception.

Several criteria of the free idea have been suggested. For example, very rapid learning has been held to indicate the presence of free ideas. Animals, however, seem never to learn so rapidly that the assumption of a purely representational consciousness is safe. (See LEARNING IN ANIMALS.) Inferential imitation, another proposed criterion, is seldom if ever found in animal activity; usually, when the animal imitates, the fact is that certain movements are aroused by interest in an object and not by a free purposive idea. (See IMITATION IN ANIMALS.) Still another index of memory might lie in the animal's ability to respond to a stimulus some considerable time after that stimulus had lapsed. In experiments made in a dark room, certain animals, which were accustomed upon the exposure of a light to go in its direction to obtain food, were restrained by the experimenter when the light was shown and released only after an interval. The length of time during which the animal could remember the direction in which the food lay varied from a few seconds in the case of rats to one minute for raccoons and five minutes for young children. It was found further that during the intervals preceding successful trials all the animals, except the raccoons, preserved some form of bodily orientation towards the position of the light: a mode of behavior which suggests that the memory was not a matter of ideas, but merely a persistence of kinæsthetic sensation. Even in the case of the raccoons, a kinæsthetic localization might have continued for a minute without being evident in bodily posture. In general it may be said that those who affirm the occurrence of free ideas in animals base their arguments less upon positive experimental evidence than upon the genetic presumption that the developmental difference between man and animals is not so great as the absence of the idea in the latter would imply.

The term "memory" is often employed in a less exact sense to denote retention; so that any modification of behavior by past experience is held to involve memory, and the facts of memory are the facts of learning. (See LEARNING IN ANIMALS.) To this type of memory belongs associative memory, an explanatory phrase used to characterize a reaction given, not to its usual stimulus, but to some other stimulus which has occurred previously, together with the usual one. Consult general texts cited in ANIMAL PSYCHOLOGY; also Hunter, "The Delayed Reaction in Animals and Children," in *Animal Behavior Monographs*, vol. ii (New York, 1913), and Watson, *Behavior* (ib., 1914). See ANIMAL PSYCHOLOGY; INTELLIGENCE IN ANIMALS; INSTINCT; MEMORY.

MEMPHIS. A city of ancient Egypt, situated about 12 miles south of modern Cairo, on the left bank of the Nile (Map: Egypt, E 2). It is said to have been founded by Menes, the first historical King of ancient Egypt, but this is as little probable as the statement in Herodotus that Menes gained the ground for building Memphis by diking off the Nile. King

Uchoreus, whom Diodorus calls the founder of Memphis, cannot be identified. It is certain that a city called the White Wall stood on the spot from prehistoric times; this name (Leukon Teichos) was still attached to the citadel and the neighboring quarter of Memphis in the Greek epoch. The kings of the fourth to the sixth dynasty built their residences not very far from Memphis, and their pyramids are in the vicinity, but Memphis proper received its name and importance from the second King of the sixth dynasty (Pepy or Apopi I), who built his pyramid and residence not far west of the small ancient city of the White Wall. The name of that pyramid, Men-nofer (good abode), extended to the whole city and, corrupted to Menfe, came down to the classical writers. In the seventh century B.C. the Assyrians called the city Mempi; in the Bible the name has been corrupted to Moph and Noph. Memphis, which had a very favorable situation, near the head of the delta, became the capital of Egypt. In later times several dynasties preferred other capitals, but Memphis always remained at least the second capital of Egypt and the second city of the land in wealth and population. The conquests by the Ethiopians, Assyrians, and Persians do not seem to have affected it much, and the writers of the earlier Roman period still describe it as filled with temples and palaces of amazing size and beauty, the Iseum, the Serapeum, and others. The decline of the city was rapid after the Arab conquest (at which time it was still the seat of a governor), when Fostat (Old Cairo) was erected in the neighborhood. Fostat and subsequently Cairo were built of stones taken from the deserted buildings of Memphis, and thus it came about that the ancient city entirely disappeared. The only remarkable monuments left there at present are the two colossal statues of Ramses II (originally 42 feet high), lying on the mound near the modern village of Mit-Rahîneh and marking the entrance to the principal and earliest temple of Memphis, that of Ptah (Greek Hephestus), and the centre of the White Wall. Abd-ul-Latif, as late as the thirteenth century A.D., found remarkable ruins on the site of old Memphis. The insignificant rubbish mounds (of Mit-Rahîneh, Bedrashên, Ennagîziyeh, etc.) extend 3 or 4 miles from north to south. The classical writers give very exaggerated accounts of the size of the city. The immense necropolis west of it, including the pyramids and tombs of Saqqara, still bears testimony, however, to the former importance of Memphis. The principal god of the city was Ptah, the master craftsman among the gods, who was believed to have formed the world; afterward the conception of this deity was called Ptah-Sokar (a combination of Ptah and Sokar, the god of the western suburb), embodied in the Apis bull and others. The numerous Phœnician merchants had a quarter of their own with a temple of Astarte.

See also EGYPT.

MEMPHIS. The commercial metropolis and largest city of Tennessee, a port of entry, and the county seat of Shelby County, situated on the Mississippi River, 454 miles below St. Louis and 739 miles above New Orleans (Map: Tennessee, A 4). Embracing 19.3 square miles, the city rests upon the lower or fourth Chickasaw Bluff, an undulating plateau that rises 32 feet above the flood tide of the river at the water front and about 77 feet at the eastern city limits. Among the public buildings are the customhouse and post office, county courthouse, costing \$1,500,000, in which the municipal offices are installed, police station, costing \$250,000, city and United States marine hospitals, and a market house. In addition there are the St. Joseph's (Roman Catholic), Baptist Memorial, and Tuberculosis hospitals and several private sanitariums and hospitals. The city contains also the Goodwyn Institute, Cossitt Library, a country and other clubs, and a number of fine modern business buildings. Educational institutions include a State normal school, medical departments of the University of Tennessee, and 37 private schools and colleges. The public-school system is composed of a central high school, a vocational school, and 35 grammar schools. In 1915 there was a total enrollment in the public schools of more than 22,000 pupils.

There are 13 State and four national banks, with a total capital stock of \$5,848,624 and surplus and undivided profits amounting to \$3,051,692. The clearings for the year ending July 1, 1914, amounted to \$425,726,391. Memphis ships freight by 175 steamboats, and 11 trunk lines of railroad have terminals here. Two belt lines convey the heavy traffic. The river is spanned at this place by a massive cantilever bridge, 1900 feet in length over the channel, and continuing as a truss bridge into the lowlands of Arkansas, a total distance of 15,635 feet. This bridge is owned by the St. Louis and San Francisco Railroad. Another great steel bridge of the same character, but somewhat larger, is now (1915) being built by the Rock Island System. The railway lines entering the city are served by two large Union stations, costing \$6,000,000.

On account of its situation at the head of deep-water navigation on the Mississippi, Memphis has become an important commercial, manufacturing, and distributing centre. It is one of the largest inland cotton markets of the world, the gross receipts for 1914 having been 1,129,553 bales and the net receipts 644,773 bales, which sold for \$46,296,137. Memphis also ranks high as a hardwood lumber market, having 155 concerns in the business with an annual output valued at about \$19,500,000; and it is of considerable importance as a cottonseed-oil producing centre, operating 12 oil mills, four refineries, and five by-products factories. Besides these there are repair shops of two railroads and more than 600 industrial plants within the city limits, embracing a large variety of products, the total value of which in 1914 was \$45,242,000. In the same year the city distributed \$24,000,000 worth of wholesale groceries, grains and foodstuffs amounting to \$18,000,000, and \$5,000,000 worth of candies and confectioneries.

The financial statement of Memphis for the year 1914 showed total receipts of \$3,617,330, while its disbursements amounted to \$3,234,305, the chief items of expenditure being \$238,000 for the police department, \$227,000 for the fire

department, \$164,000 for health, and more than \$500,000 for education. The tangible assets of the city amounted to \$18,454,000.

The site of Memphis was an ancient crossing place of the Indian tribes on both sides of the river. It was first visited by De Soto, May 8, 1541, who crossed the river here. The Bluff was seen by Marquette and Joliet in 1673, by La Salle in 1682, and by De Tonti in 1686, but none of these made a settlement there. Bienville, the French Governor of Louisiana, in his war with the Chickasaw Indians, came with a large force in 1739 and built Fort Assumption on the Bluff. Gayoso, the Spanish Governor of Louisiana, occupied it in 1795 and erected Fort Ferdinand, but abandoned it two years later when Capt. Isaac Guion, with a detachment of United States troops, arrived and built Fort Adams on the same site. On May 1, 1819, Gen. Andrew Jackson, Judge John Overton, and Gen. James Winchester, the proprietors of Memphis, laid out a small town on the Bluff and gave it its present name, after the Egyptian city. In December, 1826, Memphis was incorporated. The city suffered much during the Civil War when the Confederate gunboat fleet, under Commodore Montgomery, was destroyed by the Union fleet, commanded by Commodore Davis, and as a result Memphis came under the control of the Union armies until the close of the war. In 1855, 1867, 1873, 1878, and 1879 the city was ravaged by epidemics of yellow fever, and in the two latter years its very existence was imperilled. This disaster was followed by a collapse of its financial system, and, to avoid bankruptcy, the municipal charter was repealed (1879) by the State Legislature and the city reduced to a Municipal Taxing District of Shelby County. But the city quickly recovered, its indebtedness was bonded, and in 1893 its name and municipal form of government were restored. In 1895 the power to levy its own taxes was reconferred, and the city began a new career of progress and prosperity. Since then its growth has been rapid.

In 1909 the city was granted an amended charter which gave it the commission form of government, and this still continues in successful operation, the municipal powers being vested in a mayor and four commissioners. One of the first acts of the Taxing District government had been to install the Waring system of sewers, and this, with other sanitary measures, cleansed the city thoroughly and greatly reduced the mortality rate. More than 340 miles of sewer mains have been laid, and the city has acquired its own artesian water system, the wells, 350 to 500 feet in depth, furnishing an almost unlimited supply of clear, wholesome water. Memphis maintains a splendid system of woodland parks, embracing about 1000 acres and including a beautiful park driveway, 11 miles long, connecting the larger parks. To these have been added several extensive playgrounds for children. Five miles distant is a National Cemetery, in which are 14,039 graves, 8822 of unknown dead. Memphis is the see of a Protestant Episcopal bishop. Pop., 1850, 8841; 1860, 22,623; 1880, 33,592; 1890, 64,495; 1900, 102,320; 1910, 131,105, including 6467 persons of foreign birth and 52,441 negroes; 1914 (U. S. est.), 143,231; 1920, 162,351. Consult: Keating and Vedder, *History of the City of Memphis* (Syracuse, 1888); Young, *History of Memphis* (Knoxville, 1912).

MEMPHIS, ANCIENT AND PRIMITIVE ORDER OF. See MASONS.

MEMPHREMA'GOG. A lake situated in the Province of Quebec, Canada, and extending 7 miles into Vermont (Map: Vermont, E 2). It has an irregular shape, is 30 miles long by from 2 to 5 miles wide, and discharges its waters northeastward through the Magog River into the St. Francis. Along the west shore is a range of mountains, reaching a height (in Owl's Head) of about 3000 feet; the lake is noted for its picturesque scenery. It is a favorite summer resort; numerous handsome villas dot its shores; and in summer a steamer runs from Newport, Vt., at the south end, to the Canadian village of Magog at the north extremity.

MEN'NA. A city and the county seat of Polk Co., Ark., 84 miles by rail south of Fort Smith, on the Kansas City Southern Railroad (Map: Arkansas, A 3). It has a public library, a beautiful natural park, and St. Joseph's Academy, and is a popular summer resort. Among its industries are the manufacture of lumber and the shipment of fruit and cotton. There are municipal water works. Pop., 1900, 3423; 1910, 3953.

MENA, mā'nā, JUAN DE (1411-56). A Spanish poet, born at Cordova. After studying at Salamanca he went to Rome. He was secretary to King John II of Castile and court historian. Despite this latter position, he had nothing to do with the *Crónica de Don Juan II*. For many years he was credited with having written the first act of the *Celestina* (q.v.), but that assignment is now rejected. The *Coplas de la pastora* were also ascribed to him, but this is no longer seriously maintained, and long ago Argote de Molina credited them to Íñigo Ortiz de Zúñiga. His principal work is *El laberinto de fortuna* (1496), a poem modeled on the *Divine Comedy*. The oldest manuscripts give it as a poem of 297 stanzas, but when in later manuscripts three more were added, it received the popular title *Las tresientas*. Consult Mena, "Cancionero," edited by R. Foulché-Delbos, in the *Nueva biblioteca de autores españoles*, vol. xix (Madrid, 1912), and in the latest edition of Fitzmaurice-Kelly's *Bibliographie de l'histoire de la littérature espagnole* (Paris, 1913).

MENA, PEDRO DE (?-1693). A Spanish sculptor. He was born in Adra (Alpujanas), where he studied with his father, as he did later in Granada under Alonzo Cano. His first important work comprised several statues of saints for the convent of El Angel, Granada; this was followed (1658-62) by a commission for sculptures in high relief of 40 saints for the choir stalls of the Malaga Cathedral. In 1663 he was appointed sculptor to the cathedral chapter of Toledo, and he was also employed at Madrid, Cordova, and elsewhere. The greatest Spanish sculptor of the later seventeenth century, Mena excelled in the rendering of the nude and in the expression of fervid religious sentiment. He is at his best in single contemplative figures. His works include, besides those mentioned: a statuette of St. Francis, in the cathedral at Toledo; "A Madonna and Child with St. Joseph," in the church of St. Isidoro, Madrid; a "Crucifixion," in the church of Inestra Senoia della Gracia, Madrid; the equestrian statue of St. James, in the cathedral at Toledo. Consult Haendcke, *Etudien zur Geschichte der spanischen Plastik* (Strassburg, 1900).

MENABREA, mā'nā-brā'ā, LUIGI FEDERIGO, COUNT (1809-96). An Italian general and statesman. He was born at Chambéry in Savoy and was educated for an engineer. On completing his studies he entered the Sardinian army as lieutenant in the engineer corps, but was soon called to a professorship of mechanics in the military academy and at the University of Turin. In 1848 he was promoted to the rank of captain, served in the war against Austria, and was then employed on diplomatic business. During the War of 1859 Menabrea acted as chief of staff of the engineers in the Sardinian army. After the defeat of the Austrians by the French and the handing over of Savoy to France, he left the province to retain his Italian citizenship and was created a Senator by Victor Emmanuel and made chief of the Department of Engineers. In 1860 he became a lieutenant general and was director of the siege operations against Gaeta, where the King of Naples had taken refuge. It surrendered after a three months' siege, for which success he was made Count. In 1861 he succeeded Ricasoli as Minister of Marine, to which he added in 1862 the duties of Minister of Public Works. He assisted in framing the Treaty of Prague in 1866, which gave Venice to Italy. He was called in 1867, on the retirement of Rattazzi, to form a new cabinet. He continued to carry on the government until near the close of 1869, and in two years of his premiership did much for Italian stability, both at home and abroad. After resigning, Menabrea was appointed Italian Ambassador to London (1876) and Paris (1882). He remained at Paris for 10 years. He died at Chambéry, May 25, 1896. Among the works he wrote are: *Etudes sur la série de Lagrange* (Turin, 1844-47); *Le génie italien dans la campagne d'Ancône et de la Basse-Italie* (Paris, 1866); *République et monarchie dans l'état actuel de la France* (ib., 1871).

MENAC/CANITE. See ILMENITE.

MENADO, mā-nā'dō. The capital of the Dutch Residency of Menado in north Celebes. It is situated near the extremity of the northeast peninsula of the island, on both sides of the river Tondano (Map: East Indies, F 5). It has an ethnological museum and is defended by the old Fort Amsterdam. Its unsafe roadstead detracts greatly from its commercial importance, though it is the outlet for a large amount of coffee grown in the province. Pop., 1895, 8996; 1905, 10,578, including 694 Europeans.

MENÆCHMI, mē-nēk'mē. One of the best comedies of Plautus, so called from the twin brothers whose resemblance to each other and the amusing situations arising from their confusion form the plot of the play. The comedy is one of the earliest preserved plays of Plautus. It suggested in part the plot of Shakespeare's *Comedy of Errors*. William Warner translated the comedy into English in 1595.

MÉNAGE, mā'nāzh', GILLES DE (ÆGIDIUS MENAGIUS) (1613-92). A French lexicographer and linguist, the original, perhaps, of Vadius in Molière's *Femmes savantes*, born at Angers. Disliking the profession of an advocate, he renounced it, entered the Church, and fixed his residence in the convent of Notre Dame. Besides writing Latin verses and observations on the French language, he possessed a broad erudition, ranging from Hebrew and Greek to Italian. His *Dictionnaire étymologique, ou*

origines de la langue française (Paris, 1650-94; best ed. by Jault, 2 vols., Paris, 1750) and his *Origini della lingua italiana* (1669) are erudite and valuable works. His Latin poems, originally published in 1656, were issued in a sixth edition in 1673. The *Menagiana*, a record of his conversations and witticisms, were collected by his friends the year after his death and republished by La Monnoye in four volumes in 1729. Consult Dumont, *Gilles Ménage considéré comme poète* (Angers), and Samfresco, *Ménage polémiste, philologue, poète* (Paris, 1902).

MENAGERIE, mē-nāj'ēr-i. See ZOÖLOGICAL PARK.

MENAI (mēn'i) **STRAIT**. The channel which separates the island of Anglesey from the mainland of Wales (Map: England, B 3). It is 13 miles long and varies in width from about 250 yards to 2 miles, widening out north of Bangor into Beaumaris Bay. Navigation of it is hazardous, but the strait is nevertheless much used by vessels under 100 tons in order to save time. At the entrance of the strait the tides sometimes rise to a height of 30 feet, and the ordinary neap tide rises from 10 to 12 feet. The strait is spanned by a suspension bridge, built in 1819-26, and by a tubular bridge, built in 1849-50, which carries the London and Northwestern Railway across Britannia Rock.

MENAM, mā-nām'. The chief river of Siam. It rises in the northwestern part of that country and flows southward, emptying by several arms into the Gulf of Siam, after a course of about 700 miles, or 900 miles if its length is measured from the source of its large tributary, the Mei Ping (Map: Siam, D 4). The Menam is navigable for large steamers to Bangkok, 15 miles from its mouth, and for small vessels for about 250 miles. The river divides itself several times by arms rejoining farther down, and from June to November it overflows a large part of the surrounding country, leaving an alluvial deposit of extraordinary fertility. Thousands of tons of fish are caught and cured during the falling stages of the river at Pichai.

MENANDER (Lat., from Gk. *Méavdpos*, *Menandros*) (342-c.291 B.C.). One of the greatest poets of the Attic New Comedy, born at Athens, of a distinguished family. By his uncle, Alexis, the eminent poet of the Middle Comedy, he was initiated into the dramatist's art; his philosophical education he received from association with Theophrastus and Epicurus. He was intimate also with Demetrius. He was handsome and fond of luxury. The greater part of his time he spent at his villa in the Piræus with his beloved mistress Glycera. When Ptolemy Soter gave him a flattering invitation to his court Menander declined, preferring his native city and easy independence to royal favor. About 291 B.C. he was drowned while swimming in the harbor of the Piræus. Menander is said to have won a victory on the comic stage at the age of 21. Yet during his lifetime he was less a favorite than his contemporary Philemon (q.v.). Of his 105 or 108 plays but eight won the highest place. After his death, however, he became the favorite above all other comic poets of his time and was much read and quoted far into the Christian era. Copies of his plays were known to Suidas and Eustathius; 23 of his plays, it is said, were known in Constantinople in the sixteenth century. A well-known statue in the Vatican has been regarded by some scholars as a statue of Menander and has been

identified by them with the statue of him known to have been set up in the theatre at Athens; another statue of Menander is in the Boston Museum of Fine Arts. (Consult R. Delbrück, *Antike Porträts*, Tafel 20, Bonn, 1912.) According to ancient critics he was distinguished for his wit, the refinement and perfection of his language, and his ingenious plots, his analysis of emotions, and his penchant for moral maxims. Until recently scholars were obliged to form their opinions of his comedies chiefly from the adaptations of them by the Roman comic writers Plautus and Terence, even though they had over 1000 fragments of his plays, about 1650 verses, and a considerable collection of gnomes attributed to him. The latter collection has, however, suffered greatly from additions. The fragments are best published by Kock, *Comicorum Atticorum Fragmenta*, vol. iii (Leipzig, 1888). Within the last 20 years, however, our knowledge of Menander has greatly increased. Two leaves of papyrus containing new fragments were published by Nicole, *Le laboratoire de Ménandre* (Basle, 1898), and by Grenfell and Hunt (Oxford, 1898). In the *Oxyrhynchus Papyri*, vol. iii (London, 1903), 100 more verses from one play were given by Grenfell and Hunt. In 1906 a papyrus fragment, giving in all 1200 lines from four plays, among them 500 from each of two plays, was unearthed by Gustave Lefebvre, and was published in 1907, at Cairo, as *Fragments d'un manuscrit de Ménandre*. This discovery has given rise to an immense number of editions and of papers in the learned periodicals. For the earlier and more important part of this literature, as for these fragments themselves, consult E. Capps, *Four Plays of Menander* (Boston, 1910). Through the fragments the plots of two of the plays at least can be made out quite clearly. On the whole the fragments have been disappointing; they hardly by themselves explain Menander's great reputation in antiquity. For a translation of the fragments of one play, consult C. H. Weller, "Menander's *Arbitrants*," in *The Classical Journal*, vol. viii, pp. 275-280 (Chicago, 1912-13). A complete translation of the fragments of Menander, by F. N. Allinson, is to appear in the Loeb Classical Library. Consult: W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911); J. W. Cohoon, "Rhetorical Studies in the Arbitration Scene of Menander's *Epitrepontes*," in the *Transactions of the American Philological Association*, vol. xlv (Boston, 1915).

MENANDER. A powerful Græco-Bactrian King who ruled at the beginning of the second century B.C. Strabo refers to some of his conquests and Plutarch records that on his death, 115 B.C., various towns contended for the honor of cherishing his ashes. The large number of coins that bear his name and the wide-extended territory over which they are found seem to point to a long reign and to a domain of considerable influence. He appears in Buddhist literature as Milinda (q.v.).

MENANT, me-nān', JOACHIM (1820-99). A French Orientalist, born at Cherbourg. He was a judge in several towns and finally vice president of the higher court at Rouen, resigning in 1890. For his skill in deciphering the cuneiform inscriptions and his valuable contributions to Assyrian literature he was made a member

of the Académie des Inscriptions. His numerous writings include: *Zoroastre* (1844; 2d ed., 1857); *Notices sur les inscriptions en caractères cunéiformes de la collection épigraphique de M. Lottin de Laval* (1859); *Éléments d'épigraphie assyrienne: les écritures cunéiformes, etc.* (1860; 2d ed., 1864); *Les noms propres assyriens, etc.* (1861); *Inscriptions de Hammourabi, roi de Babylone (XVI^e siècle avant J. C.), etc.* (1863), with J. Oppert; *Inscriptions du revers de plaque du palais de Khorsabad, traduites sur le texte assyrien* (1865); *Exposé des éléments de la grammaire assyrienne* (1868); *Les Achéménides et les inscriptions de la Perse* (1872); *Le syllabaire assyrien* (1873); *Annales des rois d'Assyrie, traduites et mises en ordre sur le texte assyrien* (1874); *Babylone et la Chaldée* (1875); *Documents juridiques de l'Assyrie et de la Chaldée* (1877), with J. Oppert; *Découvertes assyriennes: la bibliothèque du palais de Ninive* (1880); *Empreintes de cachets assyro-chaldéens relevés au musée britannique sur des contrats d'intérêt privé* (1883); *Les pierres gravées de la haute Asie: recherches sur la glyptique orientale* (part I, 1883; part II, 1885); *Les langues perdues de la Perse et de l'Assyrie* (1885, 1886); *Ninive et Babylone* (1887); *Les fausses antiquités de l'Assyrie et de la Chaldée* (1888); *Les Hétéens* (1891), with A. H. Sayre; *Éléments du syllabaire hétéens* (1892).

MENANTES, mã-nân'tās. The pseudonym of Christian Friedrich Hunold (q.v.).

MEN'APHON, or CAMILLA'S ALARM to SLUMBERING EUPHUES in HIS MELANCHOLIE CELL AT SILEXEDRA. A story by Robert Greene, published under the title *Arcadia* in 1589, the year before the publication of Sidney's *Arcadia*. It contains some of the author's finest poems.

MÉNARD, mã'nār', MICHEL BRANAMOUR (1805-56). A pioneer, born of French parentage at Laprairie, Lower Canada. At an early age he entered the service of a fur-trading company at Detroit and afterward went to Missouri as an Indian trader for his uncle. He became a chief of the Shawnee Indians and gained much influence over other tribes. About the year 1833 he went to Texas and engaged in trading with the Mexicans and Indians. Owing to his influence over the Indians he was able, upon the revolt of the Texans, to prevent the Indians from assisting the Mexicans. He was a member of the convention that declared Texas independent, and afterward served in the Congress of that State. In 1836 he bought a square league of land that included most of the site of the present city of Galveston and became in effect the founder of that city.

MENASH'A. A city in Winnebago Co., Wis., 93 miles by rail north by west of Milwaukee, on Lake Winnebago, at its outlet into the Fox River, on the United States government canal of the Fox and Wisconsin River Improvement and on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Wisconsin, E 4). It has a public library and there are paper mills, a woodenware factory, flour, saw, and woolen mills, machine shops, brickyards, and manufactories of lumber products. Lake Winnebago is a popular summer resort. Settled in 1847, Menasha was incorporated first in 1874. The present government is administered under a charter of 1892, which provides for a mayor and a unicameral council.

The city owns its water works and lighting plant. Pop., 1900, 5589; 1910, 6081.

MENASSEH BEN ISRAEL, me-nās'ē bēn iz'rā-ēl (1604-57). A Jewish writer and leader, born at Lisbon, Portugal. His family emigrated to Holland, where he became a rabbi and where he established the first Hebrew press in that country. His reputation was won by publishing *El conciliador* (4 vols., 1632-51), and he became a director of a Jewish college. An English translation of his tract, *Esperança de Israel* (Hope of Israel), appearing in 1650, markedly influenced English public opinion in behalf of the Jews. In 1655 he visited London to urge the Commonwealth government to grant to Jews right of residence in England. Upon his arrival there he issued his *Humble Addresses* to the Lord Protector, which called forth Prynne's *Short Demurrer*. The courts declared that there was no law forbidding the Jews to return. In 1656 Menasseh ben Israel published his brilliant refutation of calumnies against the Jews, *Vindiciae Judæorum*.

MENCIUS, mēn'shūs (Latinized form of Chinese MĒNG-TSE or MUNG-TSE) (c.371-287 B.C.). A Chinese sage, ranking next after Confucius in the estimation of the Chinese. He was born about 371 B.C. (108 years after the death of Confucius), in the small Principality of Tsou in the present Province of Shantung, at no great distance from the birthplace of Confucius. As a youth he was known as Mēng K'o. His father died when the future philosopher was only three years old. The widow gave the fatherless boy every attention, and in due course he went to school, but does not seem at first to have been specially diligent or enthusiastic in his studies. It is said that he studied later with the disciples of Tszū-tse, the grandson of Confucius, and from them learned the doctrines of the master, of whom he became an enthusiastic admirer. When he was 40 he appeared as a public teacher with a large following of disciples. Like Confucius, he moved about from state to state, inculcating, expounding, and amplifying the Confucian teaching. He was more courageous and outspoken than Confucius and was fearless in following his teachings to their logical consequences. He taught that man's nature is good, though it may appear otherwise, and that all his vices and all his misfortunes are due to evil influences from without. Humanity, righteousness, propriety, and knowledge are as natural to man as his four limbs. He condemned warfare and held that man should and need not fight, but should be benevolent, for "the benevolent man has no enemy." He regarded wars as unjust in the main, and an instigator of wars as a criminal. What is wanted is a return to this original goodness, and this can be accomplished only by the rectification of the heart. He laid special stress on humanity and righteousness, one the complement of the other, as the two main elements in man's moral being, humanity representing the fullness of virtue in the individual and righteousness the due observance of all man owes to his fellow men. "Humanity is internal," he says; "righteousness external." "There has never been a man trained to humanity who neglected his parents; nor one who, having been trained to righteousness, made his sovereign an after consideration." Mencius was well versed in historical, political, and economic questions, in which his views were always

rational and the result of deep understanding. In politics he taught that government is from God, but is for the people, whose welfare is of supreme importance; and he emphatically inculcated the application of these two principles, humanity and righteousness, to the conduct of rulers. And he did not hesitate to indicate the duty of the subject in regard to the removal of oppressive rulers or wicked men in high places, when asked if a subject might put his sovereign to death. "He who outrages the humanity proper to his nature," he said, "is called a robber; he who outrages righteousness is called a ruffian. The robber and the ruffian we call a mere fellow. I have heard of the cutting off of Chôu-sin [the ferocious tyrant and last Emperor of the Shang dynasty, 1123 B.C.], but I have not heard in his case of putting a sovereign to death";—only a cruel monster, a mere fellow. With Mencius the happiness of the people is the first essential, and loyalty to the sovereign, as taught by Confucius, of secondary importance.

Mencius died at 84, after passing the last 15 years of his life in retirement, during which he edited the *Book of History* and the *Book of Poetry* and prepared with the aid of some of his disciples a record of his sayings and of his conversations with the princes—a fact which may account for their greater fullness as compared with those of Confucius. It is the last of the *Four Books* which form the basis of the Confucian philosophy. He was buried near the present Tsôu Hien, in Shantung, where there is a temple in his honor and where his descendants still dwell. It was not till the second century A.D. that his writings were fully studied and appreciated. In 1083 he was created Duke of Tsôu; in 1088 he was admitted into the Temple of Confucius as an Associate, and titles were conferred on his father and mother.

MENDAÑA DE NEYRA, mân-dä'nyá dã nã'ê-rá, ALVARO DE (1541-95). A Spanish navigator, born in Saragossa. He went to Peru in 1565, and had resided some time at Lima when his uncle, Lope García de Castro, the Viceroy of the country, in 1567 put him in command of an expedition for purposes of discovery among the islands of the Pacific. Among his discoveries was that of a group of islands which he named Solomon Islands, on the pretense of believing that here Solomon obtained the gold used in the temple at Jerusalem. Returning to Lima in 1568, he circulated reports of the wealth of these islands, which led, 27 years later, to an expedition for their colonization, of which he took the command. Sailing from Callao April 11, 1595, he discovered another group of islands, which he named the Marquesas,

after the wife of the Viceroy of Peru, the Marchioness Mendoza. Other groups of islands were visited, but Mendaña died without having reached the end of his voyage. Mendaña's narrative of his expeditions is in the National Library at Paris. This, with other contemporary accounts of the expedition, is translated in the Hakluyt Society publications for 1901, edited by Lord Amherst of Hackney and Basil Thomson (2 vols., London, 1901). Consult also Justo Zaragoza, *Historia del descubrimiento de las regiones australes* (Madrid, 1876-82).

MENDAÑA ISLANDS. See MARQUESAS ISLANDS.

MENDE, mänd. The capital of the Department of Lozère, France, on the left bank of the Lot, 110 miles southwest of Lyons. It is situated at the foot of a cliff rising 1000 feet above the town (Map: France, S., H 4). Its cathedral of St. Peter was founded in the fourteenth and rebuilt in the seventeenth century, with two towers, 280 and 210 feet high. In front of it stands a bronze statue of Pope Urban V, a native of the town. The town has also several normal schools, a communal college, and a library. It is the seat of a bishop. The chief industry is the manufacture of woollens, flannels, serges, and shallons. Pop. (commune), 1901, 7319; 1911, 7005.

MENDEANS, mên-dē'anž. See CHRISTIANS.

MENDEL, GREGOR JOHANN (1822-84). An Austrian botanist. He was born at Heinzen-dorf, Austrian Silesia, and in 1843 entered the Augustinian Königinkloster at Brünn. He became a priest in 1847; studied at Vienna (1851-53); returned to the cloister; taught at Brünn, and became abbot. While Mendel was teacher of natural science in the Brünn Realschule (1853-68) he was largely occupied with experiments in hybridization, with a view to obtaining some evidence as to the laws of heredity. His results are discussed under MENDEL'S LAW (q.v.). After 1873 Mendel's duties as abbot at Brünn prevented further biological work. See HEREDITY.

MENDELÉEV, myën'de-lé'yéf, DMITRI IVANOVITCH (1834-1907). A Russian chemist, born in Tobolsk, Siberia. He graduated from the local Gymnasium and in 1850 entered the Institute of Pedagogy of St. Petersburg, where he applied himself to the study of natural sciences. In 1856 he was appointed docent at the University of St. Petersburg and in 1859-61 he worked in Heidelberg and published a monograph *On the Capillarity of Gases*. Shortly afterward he published his *Organic Chemistry*. He was made professor of chemistry at the St. Petersburg Institute of Technology in 1863, and three years later at the university. In 1871-75 he made extensive studies on the compression of gases, embodied in his *On the Elasticity of Gases*. In 1876 he was commissioned by the authorities to study the petroleum industry in Pennsylvania and the Caucasus. His work on *Aqueous Solutions* (1886) was received by chemists as a notable contribution to experimental chemistry, although his "theory of solutions," according to which solvents invariably form chemical compounds with the substances dissolved in them, has been strongly criticized by physical chemists of the modern German school. As member of the Council of Commerce and Industries, Mendeléev was the champion of protection of home industries, and the policy of Russia in that direction dates practically from the publica-

tion of his *Tariff Elucidated* (1890). He worked out the formula for the *pyrocollodial* smokeless powder, serviceable for all firearms, when Russia undertook to rearm her forces. In 1893 he was made conservator of weights and measures in the new Chamber of Weights and Measures established in the Department of Finance.

His *Elements of Chemistry* (1st ed., 1868-70; 3d Eng. trans. from the 7th Russian ed., 1905) is a standard work and has been translated into German and French, as well as English. In it he first set forth his celebrated principle, later embodied in *La loi périodique des éléments chimiques* (Paris, 1879), and now generally known as the periodic law (q.v.), viz.: "The properties of the elements, as well as the forms and properties of their compounds, are in periodic dependence on, or form a periodic function of, the atomic weights of the elements." This law enabled Mendeléev to foretell the existence and even the properties of several unknown elements, which have since been actually discovered. Mendeléev is also the author of an interesting hypothesis on the nature of the universal ether embodied in *Attempt toward a Chemical Conception of the Ether* (Eng. trans., New York, 1904). His scientific contributions (over 150), dealing mostly with physical chemistry, have appeared in German and French scientific periodicals. Consult T. E. Thorpe, *Essays in Historical Chemistry* (London, 1902).

MENDELISM. See MENDEL'S LAW.

MENDEL'S LAW. A law of heredity announced in 1865 by Gregor Mendel (q.v.) in the *Proceedings of the Natural History Society of Brünn*, under the title *Versuche über Pflanzenhybriden*. It attracted no attention until 1900, when it was brought to light simultaneously by De Vries (Holland), Correns (Germany), and Tschermak (Austria), who were conducting genetic experiments with plants. This law has now become the working basis of most of the investigations in genetics. Mendel chose for his experiments the garden pea (see PISUM), because the plants are grown easily, the generations are short, and the contrasting characters are sharp. For example, in the various races the colors of the flowers are purple, red, or white; the mature seeds are smooth or wrinkled; the stature of the different races is either distinctly tall or just as distinctly dwarf. Hybrids were used because by this means the contribution of each parent could be recognized. Mendel's genius as an experimenter was indicated by the fact that, instead of studying the total results of inheritance through successive generations, he selected a single pair of contrasting characters, neglecting all other characters. These contrasting characters were traced through a series of generations, and, since all behaved alike, Mendel was able to formulate his general law. A single illustration will indicate the results obtained from all of the characters. When purple-flowered and white-flowered forms were crossed, all of the hybrid progeny were purple-flowered. In genetics this first hybrid generation is called the F_1 generation. The disappearance of the white character in the F_1 generation, followed by its reappearance in the next generation, led to the conclusion that the white character is present in all of the F_1 individuals, but does not express itself on account of the presence of the purple character; therefore, purple was said to

be "dominant" over white, which was said to be "recessive." Mendel's law appears, however, in the behavior of the next generation (F_2). In the F_2 generation three kinds of individuals appear in a definite ratio, which becomes evident if four individuals are selected as an illustration. One of the four is a pure purple individual, as shown by breeding true generation after generation; a second is a pure white individual, as shown by subsequent breeding; while two of the four are purple individuals, but contain the white character as a recessive, as shown by subsequent breeding, behaving simply like all of the individuals of the F_1 generation. This ratio is expressed in two different ways: (1) by writing it 1 : 2 : 1, thus indicating the occurrence and proportion of the three kinds of individuals; or (2) by writing it 3 : 1, which in the experiment cited indicates that there are three purple individuals to one white one. Of course this latter expression does not show that there are two kinds of purple individuals. In general Mendel's law is often described as showing that hybrids "split" into the definite ratio 3 : 1. Involved in the law, however, is the idea of "unit characters," which means that characters retain their individuality, being transmitted intact and not blending with other characters. When two characters are mutually exclusive, one of them is always "dominant" over the other, which is then said to be "recessive." Mendel's explanation of this behavior of unit characters is that paired characters received from the two parents are segregated in the germ cells (eggs and sperms) of the progeny, so that each germ cell contains only one of the characters. In such a case there would be two kinds of eggs and sperms, and the chance of mating is expressed by the Mendelian ratio. For example, an egg of the pea in the experiment cited could contain either the purple character or the white character, but not both; i.e., two contrasting characters are mutually exclusive in the germ cells. The most fundamental feature, therefore, of Mendel's law is the theory of the so-called "purity of the germ cells" in reference to characters. Consult: William Bateson, *Mendel's Principles of Heredity* (New York, 1909); R. H. Lock, *Recent Progress in the Study of Variation, Heredity, and Evolution* (ib., 1906; new ed., 1910); R. C. Punnett, *Mendelism* (3d ed., ib., 1911); A. D. Darbishire, *Breeding and the Mendelian Discovery* (ib., 1911). See BREEDING; HEREDITY; HYBRIDITY.

MENDELSSOHN, mën'del-sōn, MOSES (1729-86). A German philosopher of Jewish parentage. He was born Sept. 6, 1729, at Dessau. From his father, a schoolmaster and scribe, he received his first education; and in his thirteenth year proceeded to Berlin, where, amid very indigent circumstances, he contrived to learn Latin and modern languages and to apply himself to the study of philosophy. After many years of comparative poverty he became partner to a rich silk manufacturer, whose children he had educated. The intimate friend of men like Lessing—whose *Nathan der Weise* had its prototype in him—Sulzer, and Nicolai, he contributed in a vast degree to the mitigation of the brutal prejudices against the Jews. On the other hand, he broadened the outlook of his own coreligionists. He died Jan. 4, 1786. His principal works are: *Pope, ein Metaphysiker* (1755), with Lessing; *Briefe über die Empfindungen*

(1755); *Ueber die Evidenz in den metaphysischen Wissenschaften; Phädon, oder über die Unsterblichkeit der Seele* (1767); *Jerusalem, oder über religiöse Macht und Judenthum* (1783); *Morgenstunden* (1785). His works have been collected and edited by G. B. Mendelssohn (7 vols., Leipzig, 1843-45). Consult: Hensel, *Die Familie Mendelssohn* (9th ed., Berlin, 1898; Eng. trans., London, 1882); Kayserling, *Moses Mendelssohn* (Leipzig, 1882); Ritter, *Mendelssohn und Lessing* (Berlin, 1886); Des-sauer, *Der deutsche Plato* (ib., 1879); Galestein, *Moses Mendelssohn und die deutsche Ästhetik* (Königsberg, 1904). His philosophy was of a rather superficial popular sort, whose aim was to find good reason for opinions currently regarded as correct.

MENDELSSOHN-BARTHOLDY, mën'del-sön-bär-töl'di, FELIX (1809-47). A famous German composer. He was born at Hamburg, Feb. 3, 1809, the son of Abraham Mendelssohn and Leah Salömon. The latter's brother, after embracing Christianity, assumed the name Bartholdy, which the Mendelssohns then added to their family name. The family was wealthy and highly refined. Felix's grandfather was the celebrated Moses Mendelssohn (q.v.). His children were brought up in the Protestant faith. Felix received piano instruction first from his mother; afterward Ludwig Berger became his teacher. His instructor in counterpoint and musical composition was Zelter; and the finishing touches to his skill as a pianist were given by Moscheles. His eldest sister, Fanny, shared this instruction.

Mendelssohn began to compose before he was 12 years of age, and also showed great taste in drawing, and was rapid, yet accurate, in his general studies. Notwithstanding his remarkable achievements for one so young, his education continued on broad lines. Much of the charm which he exerted through life was due to his combining with musical genius the tastes of a man of high culture. When 11 years old he paid a visit to Goethe, who was delighted not only with his musical accomplishments but with his modesty and refinement.

The home of the Mendelssohns was the centre of a cultured circle. At the Sunday concerts which were given there the most eminent people residing or visiting in Berlin were met—musicians like Weber, Spohr, Paganini, Liszt, Schumann; painters like Ingres, Vernet, Verboeckhoven, Kaulbach; singers like Lablache, Grisi, Pasta; and in addition to these, actors, sculptors, poets, and scientists, among the latter the Humboldts, Bunsen, and Jakob Grimm. One can imagine the rich life which unfolded itself within such a circle and its influence upon Felix's development. One of the intimates of the circle was Hensel, the portrait painter, who married Fanny, herself scarcely inferior to Felix at the piano. Notwithstanding his pronounced musical gifts, Felix's father, in order to make sure that he was acting wisely in the choice of a musical career, took him in 1825 to Cherubini in Paris. After examining several of the boy's compositions, Cherubini gave an affirmative answer. In the same year Mendelssohn composed his octet (Opus 20). In February, 1827, his *Midsummer Night's Dream* overture was played at Stettin and was received with great applause. April of the same year saw the production of his opera, *The Wedding of Camacho*, in Berlin, but it was not a success.

In 1828 he composed his overture to Goethe's poem, *A Calm Sea and a Happy Voyage*; and a letter from Fanny, Dec. 8, 1828, to his friend, the poet Klingemann, refers to his composition of *Songs without Words*. One of Mendelssohn's finest achievements, the first performance since Bach's death of the *St. Matthew Passion*, took place in Berlin in 1829. The greatest difficulties had to be overcome, not the least being the indifference of musicians and public, but Mendelssohn brought the affair to a triumphant issue, and thus gave the first impetus to the great Bach revival through which that composer at last obtained due recognition. In April, 1829, Mendelssohn made the first of several visits to England, where his former teacher, Moscheles, was settled. He was well received socially, and his concert appearances both as pianist and composer were highly successful. He made a tour of Scotland and visited the Hebrides. During a visit to the ruined palace of Holyrood, with its traditions of Queen Mary, he hit upon the beginning of his *Scotch Symphony*; and his trip to the islands inspired his *Hebrides* or *Fingal's Cave* overture. The germ of his *Reformation Symphony* also dates from this time. The *Scotch Symphony*, however, was not completed until many years later, having its first performance in Leipzig in March, 1842, and in London at a Philharmonic concert in June of the same year.

In 1830 he declined an offered professorship of music in the University of Berlin, and in the same year he traveled to Italy. In Rome he began one of his most important works, the cantata to Goethe's *First Walpurgis Night*, and in a letter to Fanny, dated from Rome, in February, 1831, he writes that the *Italian Symphony* is making great progress. After various travels, including visits to Paris and London, where his appearances again were highly successful, he accepted an invitation to conduct a music festival at Düsseldorf. This led to his taking, in 1833, the post of musical director of the city, where he remained, quickening the musical life of the place and engaging in the composition of the greater part of his oratorio of *St. Paul*, until 1835, when he became conductor of the famous Gewandhaus concerts in Leipzig. Here his activity was of the utmost importance. He not only brought the orchestra to a high state of perfection, but he was chiefly instrumental in the founding of the Leipzig Conservatory.

His oratorio of *St. Paul* was brought out at the Lower Rhenish Musical Festival (q.v.), at Düsseldorf, under his own direction, in May, 1836. In 1837 he married Cécile Jean-Renaud, the daughter of a French clergyman in Frankfurt. The union was a most happy one. During his incumbency at Leipzig he made frequent tours, and in 1841 went, at the invitation of Frederick William IV, to Berlin, and at his instigation composed the music to *Ædipus*, *Ædipus Colonos*, and *Antigone*; *Athalie*; and the rest of his music to the *Midsummer Night's Dream*. Late in 1842 he returned to Leipzig. Previously during that year he had visited England for the seventh time, and by invitation had played for Queen Victoria and the Prince Consort at Buckingham Palace. In 1844 he was again in England, and in August, 1846, brought out with overwhelming success at the Birmingham festival his oratorio *Elijah*. In 1847 the sudden death of his beloved sister Fanny came as a great shock to him, and his system, weak-

ened by overwork, succumbed. In September, in Leipzig, while listening to his own recently composed *Night Song*, he swooned away. Nervous prostration followed, and on November 4 he died.

Probably no composer ever was so feted during his lifetime or lost so much ground after his death as Mendelssohn. He was the idol of the public and a large circle of friends. In England his popularity amounted to a Mendelssohn worship. His music, polished like himself, perfect in form, melodious, easily understood, and not too difficult technically, immediately became popular in concert and drawing rooms. It presented no problems and solved none. He was, as a rule, a rapid producer; the music to *Antigone* was composed in 11 days. But the very quality which made his music attain such immediate popularity, a certain superficial prettiness, has caused much of it to be laid aside. His oratorios are still given, and the *Elijah* especially holds its own; the violin concerto is an admirable composition; the *Midsummer Night's Dream* overture has fairylke grace; certain *Songs without Words* and the *Variations sérieuses* have a definite value in the pianoforte curriculum; and several of his choral works are highly valued. But the bulk of his product, including his fine symphonies, is less and less heard of. As a conductor, his attitude towards new departures was not friendly. Wagner's *Tannhäuser* overture he played at a Gewandhaus concert "as a warning example." But for Bach and the appreciation of Beethoven's later works he did much.

Bibliography. A. Reissmann, *Mendelssohn, sein Leben und seine Werke* (Berlin, 1867); F. Hiller, *Mendelssohn, Letters and Recollections* (London, 1874); W. A. Lampadius, *Life of Mendelssohn* (Eng. trans. by Gage, London, 1876; new ed., New York, 1911), a standard work; Hensel, *The Mendelssohn Family, 1729-1847, from Letters and Journals*, Eng. trans. by Carl Klingemann (New York, 1881); W. S. Rockstro, *Mendelssohn, "Great Musicians Series"* (London, 1890; new ed., New York, 1911), an excellent short life; J. C. Hadden, *Life of Mendelssohn* (London, 1903); E. Wolff, *Mendelssohn* (Berlin, 1906).

MENDELSSOHN SCHOLARSHIP. The most valuable musical prize in Great Britain, which entitles its holder to a course of study abroad. The movement for founding such a scholarship began in 1848, when the proceeds from a performance of *Elijah* were set aside for the purpose. In 1856 the first scholar, Arthur Sullivan, was elected. The capital has been gradually added to until the annuity now consists of about \$500. There is also a Mendelssohn scholarship in Berlin, whose value is about \$720, half of which is awarded to composers and half to virtuosos.

MENDENHALL, mën'den-häl, GEORGE (1814-74). An American physician. He was born at Sharon, Pa.; graduated Ph.D. from the University of Pennsylvania in 1835; and in 1843 established himself in Cincinnati, where he specialized in obstetrics. In Miami Medical College he served as professor of obstetrics and as dean. In 1870 he was president of the American Medical Association. He was the author of *Medical Students' Vade-Mecum* (1852).

MENDENHALL, THOMAS CORWIN (1841-). An American physicist, born near Hanover, Ohio. He received a common-school edu-

cation, became professor of physics and mechanics in the Ohio State University in 1873, and in 1878 accepted the chair of physics in the Imperial University at Tokyo, Japan. His labors there were later incorporated into the government meteorological system; and his interest in the phenomena of earthquakes led him to help found the Tokyo Seismological Society. Returning to Ohio State University in 1881 as professor of physics, he developed the State weather service. Three years later he was called to the United States Signal Service at Washington. In 1886 he was appointed president of Rose Polytechnic Institute, Terre Haute, Ind.; in 1889 he became superintendent of the United States Coast and Geodetic Survey; and in 1894-1901 he was president of the Worcester Polytechnic Institute. In 1889 he served as president of the American Association for the Advancement of Science, and in 1911 he was decorated with the Order of the Sacred Treasure of Japan. He made several important contributions to physical science and is the author of *A Century of Electricity* (1887).

MENDENHALL, WALTER CURRAN (1871-). An American geologist, born at Marlboro, Stark Co., Ohio. He graduated from Ohio Normal University in 1895 and studied at Harvard (1896-97) and at the University of Heidelberg (1899-1900). On the United States Geological Survey he served as assistant (1894-96), assistant geologist (1896-1901), and geologist after 1901. In 1907-10 he had charge of the ground-water investigations of the United States and in 1910 he became chief of the Land Classification Board. The results of his work in various States and in Alaska and Hawaii were published in government reports and bulletins and in contributions to the scientific press.

MENDERES, mën'dër-ëz. The modern name of the Mæander (q.v.), a river of Asia Minor.

MENDÈS, măn'dăs', CATULLE (1841-1909). A French poet, novelist, and playwright, born in Bordeaux. He founded (1859) the *Revue Fantaisiste*, devoted to the interests of the Parnassian poetic group. In 1866 he was married to Judith Gautier (q.v.), but they soon separated. His *Poésies* appeared in 1872 (new ed., 3 vols., 1892), and *Les braises du cendrier* (1900) is also verse. Although accomplished and versatile as a poet, Mendès lacked the inspiration that would have placed him with Coppée or Sully Prudhomme. Among his novels are: *Histoires d'amour* (1868); *Le roi vierge* (1880), the best known; *Mephistophela* (1890); *Gog* (1896). His plays include: *La part du roi* (1872); *Les frères d'armes* (1873); *La justice* (1878); *Le femme de Tabarin* (1887); *Médée* (1898); *La reine Fiammette* (1898); *Scarron* (1904); *Glatigny* (1906); *Sainte-Thérèse* (1906), in which Sarah Bernhardt appeared with success. Definitive collections of his plays appeared as *Théâtre en prose* and *Théâtre en vers* (both 1908). He wrote librettos for Chabrier's *Gwendoline*, Hahn's *Carmélite* (1902), Erlanger's *Le fils de l'étoile* (1904), and Massenet's *Ariane* (1906) and *Bacchus* (1909). In criticism he published *Richard Wagner* (1886); *L'Art au théâtre* (1896-1900); *Le mouvement poétique, 1867-1900* (1903).

MENDES LEAL, măn'dësh là-ăl', JOSÉ DA SILVA (1820-86). A Portuguese dramatist, statesman, and diplomat, born at Lisbon. He produced a number of plays which have been

very successful. The following are the best: *Os dous renegados* (1839); *Egas Moniz* (1861); *Madre Silva* (1847); *A pobre das ruínas* (1846); *Os homens de marmore* (1854); *Os homens de ouro* (1855); *Pedro* (1857); *A escala social* (1858); and especially the comedies *O tio André que vem do Brazil* (1855) and *Receita para curar saudades* (1857). He became a member of the Portuguese Academy (1845) and was director of the National Library (1850-67). As early as 1851 he was elected to Parliament, served twice as Minister of State, was elected President of the Chamber of Deputies in 1868, and was raised to the peerage in 1871, after which he entered the diplomatic service. Consult A. Romero Ortiz, *La literatura portuguesa en el siglo XIX* (Madrid, 1869).

MENDES-PINTO, măn'dêsh-pên'tô, FERNÃO. See PINTO, FERNÃO MENDES.

MENDI. See SEMANG.

MENDIBURU, mên'dê-bôo'rôo, MANUEL DE (1805-85). A Peruvian statesman and historian, born in Lima. He was educated at the University of San Marcos. When the movement for independence reached Peru, he joined the patriot army as color sergeant in 1821. As lieutenant he distinguished himself in various battles, and after the conclusion of the war was made captain (1830) and by 1851 had reached the rank of general. In 1831 he was sent on special missions to Brazil and Spain. From 1834 to 1870 he was employed in the government service, filling successively the positions of prefect of various departments; holding the portfolios of Government, Treasury, Foreign Relations, and War and Marine; serving as deputy in congress, Vice President of the Constituent Assembly, and Minister of Peru to England, to Bolivia, and to Chile. In 1870 he was placed in charge of the School of Arts and Trades at Lima. During his long and active political career he found time for writing and historical study. His *Diccionario histórico-biográfico del Perú* (1874-85) is a monumental work based upon manuscript sources, existing in the Archivo Nacional de Lima, which he reorganized, and is invaluable for the study of Peruvian history, especially during the colonial epoch.

MENDICANCY (from *mendicant*, from Lat. *mendicans*, pres. p. of *mendicare*, to beg, from *mendicus*, poor). The practice of begging. A beggar is one who seeks to get his living, in whole or in part, by soliciting alms. The word "beggar" is probably derived from the Beghards, a religious order of the Middle Ages corresponding to a similar order among women, the Beguines (q.v.). Small communities of the Beguines still exist in Belgium.

In primitive societies beggars have little chance for existence. Whenever and wherever a surplus results from labor, there appears a class of the economically unfit ready and anxious to live as parasites on the labor of others. If, through the influence of religion or other causes, almsgiving comes to be looked upon as a virtue, mendicants will rapidly increase. Such a condition existed in Europe in the Middle Ages, and beggars became so numerous that they threatened to overrun the Continent. The Church inculcated almsgiving and emphasized it as a means of obtaining future happiness. The great success of the orders of the begging friars, the Franciscans, Dominicans, Carmelites, and Augustinians, encouraged begging among the laity. Meantime there was a gradual development of

monasteries, hospitals, guilds, and private benevolence, entirely independent of each other, yet all giving alms, and this without any thought of investigation as to the worthiness of the recipient.

In 1349 England began to forbid begging. France followed in 1350, and later some of the German towns, as Esslingen (1384) and Brunswick (1400). Such legislation was of little effect. During the fifteenth century the idea gradually gained ground that the able-bodied poor must be set at work. The adoption of this view involved the overthrow of the old theory of almsgiving, and it was steadily opposed by the Church.

The sixteenth century marks a great change. Luther said that one of the most crying needs of Christian countries was the prohibition of begging, and measures to this effect introduced in the "Regulation of the Common Chest" became the basis for subsequent reforms. Under the influence of Zwingli, Zurich prohibited begging in 1525. The Catholic Vives wrote *De Subventionem Pauperum* (Bruges, 1526), which led to the breakdown of the old system in Catholic Europe, in the north at least, for in Spain, through the influence of the Dominican monk Soto, the prohibition was not decreed, and Italy has only partially forbidden the custom.

Germany after the Thirty Years' War made more stringent regulations, but the various states were not in harmony, and the root of the evil was not reached. Frankfort (1620), Anhalt (1770), Hesse (1777) forbade begging entirely. Hamburg followed in 1788 and forbade also gifts to beggars. Here was introduced more effective investigation of the individual cases, and other cities copied the plan. By 1791 it is reported that open begging had been stopped. The general German law is that vagabonds (*Landstreicher*—best translated "tramps") may be imprisoned. Beggars, those who ask alms either in person or through letters, may be put to hard work. In some of the states appeals for assistance may not be published in the papers without special permission. Bavaria made a statistical investigation of mendicancy between 1870 and 1880 which showed that some 20,000 persons were convicted each year. In Saxony, between 1880 and 1887, of those convicted 47 per cent were Saxons, 42.7 from other German states, and 10.3 foreigners. In many towns there is a Verein gegen Verarmung und Bettelei.

France forbade mendicancy in 1566, but the efforts made to enforce the law were ineffective. In 1627 it was ordered that beggars be impressed into the navy. Later, beggars were commanded to leave Paris under penalty of being sent to the galleys. After the Revolution, however, penal colonies, *dépôts de mendicité*, were established.

Italy prohibited begging in 1865, but local authorities may issue permits (*permessi di mendicare*), and begging, licensed or not, abounds, particularly in the southern provinces.

The practice has also been prohibited in other countries—Denmark (1789, 1803, 1860), Norway (1863), Russia (1864), Sweden (1885). In Mohammedan lands, where almsgiving is still a religious obligation, beggars abound.

England in 1536 decreed that an able-bodied beggar should be whipped for the first offense, have his ears cropped for the second, and be executed as a felon and common enemy for the third. In 1547 he was to be branded and be-

come the slave of any one who would care for him for two years. In the Act of 1536 "common and open doles" were prohibited, and the parish authorities instructed to care for the worthy poor. The civic authorities were still trying various schemes. Oxford had four "bedells of the beggars" who "took a ward every Friday to gather the devotion of the houses" and on other days "daily the streets to walk, to look what other beggars or vagabonds do come into the city and then to give notice to the constables." In Southampton in 1540 a "master of beggars" with a silver gilt badge and small annual fee is mentioned. York (1538) decided that "from henceforth no Headbeggars shall be chosen," and by the end of the reign of Elizabeth the other towns had followed her example. In 1562 compulsory labor was made possible. In 1601 came the famous poor law of Elizabeth (43 Eliz., c. 2) which emphasized the necessity for work; 1676 marked the establishment of the first workhouse at Bristol; and with these changes the modern system is inaugurated. Yet begging was not abolished, and in Scotland (see *The Antiquary*, Walter Scott) in the early part of the nineteenth century the Bedesmen or Blue Gowns were licensed. The present English law is that of 1824. Habitual begging is a criminal offense, punishable in a summary manner, i.e., without trial by jury. (See VAGRANT.) For the first offense one may be committed as "idle and disorderly" to one month at hard labor; for the second offense as a "rogue and vagabond" for three months; for a third as an "incorrigible vagabond" for one year. One who solicits charitable contributions by lying letters, false writings, or any other cheat is liable to punishment for obtaining money under false pretenses (q.v.). If begging be accompanied by threats of violence, it may subject the offender to punishment for robbery (q.v.).

In the United States mendicancy has been looked upon as bad and is generally forbidden. The laws have been very leniently enforced and in many places are almost dead letters. Only one State, Massachusetts, has provided a farm colony to which beggars may be sent and made to work. In some cities energetic steps are being taken to make begging unprofitable, and special attention is being paid to parents who send young children out to beg, or who cover their begging by pretense of selling odds and ends.

The experience of all countries has shown that mendicancy will thrive wherever indiscriminate almsgiving prevails. In modern society it may practically be stopped if steps are taken to care properly for the worthy poor and to compel others to work or else go hungry.

For an account of the general development of the care of the poor, see PAUPERISM. See also CHARITY ORGANIZATION SOCIETY; LABOR COLONIES; SOCIAL DEBTOR CLASSES; TRAMPS.

Henderson, *Introduction to the Study of Dependents and Defective Classes* (Boston, 1901); Louis Rivière, *Mendiants et vagabonds* (Paris, 1902); Camille Roiff, *De l'institution des dépôts de mendicité et de ses résultats* (ib., 1912); G. and J. Berry, *Le vagabondage et la mendicité en Russie, en Allemagne, en Hollande, en Belgique, dans les états scandinaves et dans le canton de Berne* (ib., 1913); also *Proceedings of the National Conference of Charities and Corrections* (Boston, 1875 et seq.), yearly reports of Charity Organization Societies. Victor Hugo, *Notre Dame de Paris*, and Charles Reade, *The Cloister and the Hearth*, contain accounts of the organizations of beggars.

MEN'DICANTS. See AUGUSTINIANS; CARMELITES; DOMINICANS; FRANCISCANS.

MENDOCINO, mên'dô-sê'nô, CAPE. See CAPE MENDOCINO.

MENDO'TA. A city in La Salle Co., Ill., 83 miles west of Chicago, on the Chicago, Burlington, and Quincy, the Chicago, Milwaukee, and St. Paul, and the Illinois Central railroads (Map: Illinois, F 2). It has a public library, Blackstone and Lincoln schools, and manufacturing of machinery, agricultural implements, water-tank heaters, etc. The water works and sewage system are owned by the city. Pop., 1900, 3736; 1910, 3806.

MENDOTA, LAKE. One of the so-called "Four Lakes" (q.v.) of Wisconsin.

MENDOZA, mên-dô'sá. A province of Argentina, comprising 16 departments, situated in the western part of the Republic and bounded on the north by the Province of San Juan, on the east by San Luis, on the south and southeast by the territories of La Pampa and Nequen, and on the west by Chile (Map: Argentina, F 5). Its area is estimated at 56,517 square miles. The western portion is occupied by the slope of the Andes Range, which rises on the boundary to a height of over 22,000 feet in Mount Aconcagua. Several lofty passes, including the famous and most frequented Uspallata, lead from the province into Chile. The eastern portion, from the foothills of the Andes to the border, is divided into two regions by the Río Diamante. That to the north is dry and arid, and that to the south consists of a well-watered grassy plain. The principal rivers are the Mendoza, Diamante, Tunuyán, and Atuel. The climate in the Andean region is cold, in the southeast temperate, and in the northeast hot. Owing to climatic conditions, irrigation is necessary in many parts of the province. The most important industry is vine culture and the production of wine, which is carried on chiefly in the Andean region. Agriculture and stock raising are carried on in the eastern section. Barley, fruits, hemp, wheat, corn, and lucern are the chief agricultural products. Cattle, hides, and wool are important exports. The extensive mineral deposits consist of coal, gold, silver, copper, and lead. There are, also, many mineral springs. The province has a national college, a normal school, and 286 primary schools. The Trans-Andean Railway crosses the northern part of the province. Pop., 1912, 247,848. Capital, Mendoza.

MENDOZA. The capital of the Province of Mendoza, Argentina, situated at the eastern base of the Andes, 647 miles west of Buenos Aires, on the Trans-Andean Railway (Map: Argentina, F 4). The town is well built and has beautiful drives and parks. It has a national college, an agricultural institute, normal

schools for both sexes, and a street railway. It is the chief centre of trade between Argentina and Chile. Pop., 1913 (est.), 60,000. Mendoza was founded in 1560. Here San Martín organized the army with which he won the independence of Chile. In 1861 a severe earthquake destroyed the city and killed 10,000 people. Consult V. Letelier, *Apuntes sobre el terremoto de Mendoza* (Santiago de Chile, 1907), and V. Blasco Ibáñez, *Argentina y sus Grandezas* (Madrid, 1910).

MENDOZA, mên-dô'thà, ANNA DE, PRINCESS OF EBOLI. See EBOLI.

MENDOZA, ANTONIO DE, COUNT OF TENDILLA (c.1485-1552). A Spanish administrator, born in Granada. He was a member of an illustrious family and became a great favorite with the Emperor Charles V. Constant quarrels in New Spain between the Governor, the nobility, and the Audiencia (the commission representing the Emperor) led to the determination to appoint in each territory a personal representative of the Emperor's authority, and Mendoza was appointed the first Viceroy of New Spain. He arrived there in 1535. With him he brought a printing press on which was printed the next year *La escala de San Juan Climaco*, the first book printed in Mexico. A mint was established the same year, schools and hospitals were built, and a college was founded. The breed of sheep was improved, silk culture was encouraged, and better methods of agriculture were introduced. An expedition under Vásquez de Coronado was sent to discover the mythical city of Cibola and the no less mythical Quivira, and explored much of what is now New Mexico and Colorado. In 1542 a formidable insurrection of the Indians, called the Mixton War, was suppressed. Mendoza was not able to carry into effect the prohibition of further enslavement of the Indians, but succeeded better than might have been expected. In 1550 he was appointed Viceroy of Peru. He was an amiable but dignified and just man, a striking contrast to many of the Spanish rulers.

MENDOZA, DIEGO HURTADO DE (1503-75). A Spanish statesman and man of letters, born at Granada. Trained at Salamanca for the Church, he entered instead upon a military career and passed through the Italian campaigns of Charles V. The latter sent him as Ambassador to Venice (1539), whence he passed (1547) to Siena as the Imperial Governor. He had (1545) represented his Imperial master at the Council of Trent, and in 1549 he went to Rome to carry out Charles's policy of bullying the papacy. In 1554 he returned to Spain. As a poet, Mendoza has left compositions in the older conventional Spanish manner and some that show the influence of his classical attainments; he gained greatest repute in his own time, however, as one of the leaders in the movement which accomplished the Italianizing of Spanish lyric poetry. Mendoza's prose work of the most importance is his *Guerra de Granada*, dealing with an insurrection of the Moors. His acquaintance with Arabic equipped him admirably for the performance of this historical task, but his outspoken honesty prevented the appearance of a complete edition of the work until 1730, for the editions of Madrid (1610) and Lisbon (1627) are defective. Competent scholars no longer accept the attribution to him of the *Lazarillo de Tormes*. Morel-Fatio in a recent study points out some grave defects of style,

even in the much praised *Guerra de Granada*, and questions the right of Mendoza to be considered the sole author thereof. Consult his verse in vol. xxxii of the *Biblioteca de autores españoles* (Madrid, 1854) and, in vol. xxi of that same collection (ib., 1852), an edition of the *Guerra de Granada*; J. D. Fesennair, *D. Hurtado de Mendoza, ein spanischer Humanist des 16ten Jahrhunderts* (Munich, 1882); A. Señán y Alonso, *D. Diego Hurtado de Mendoza apuntes biográfico-críticos* (Granada, 1886); Foulché-Delbosc, in the *Revue Hispanique*, vols. i, ii (Paris, 1894-95); Alfred Morel-Fatio, "Quelques remarques sur La Guerre de Grenade de D. Diego Hurtado de Mendoza," in *Annuaire de l'Ecole des Hautes Etudes*, 1914-15 (ib., 1914).

MENDOZA, IÑIGO LÓPEZ DE, MARQUÉS DE SANTILLANA. See SANTILLANA, IÑIGO, LÓPEZ DE MENDOZA, MARQUÉS DE.

MENDOZA, JUAN GONZÁLEZ DE (c.1540-1617). A Spanish prelate, born at Toledo. He joined the army, but after some years resigned to enter the Order of St. Augustine. In 1580 he was sent by Philip II to China, where he spent three years in gaining information as to the politics, commerce, and customs of the country. He spent two years in Mexico before returning to Spain. He was afterward Bishop of the Lipari Islands, of Chiapas, and of Popayán, where he died. He published an account of his observations in China in a work entitled *Historia de las cosas más notables, ritos y costumbres del gran reyno de la China* (1586). An English translation by R. Parke appeared in 1588 and was reprinted by the Hakluyt Society in two volumes, edited by Sir George T. Staunton, Bart. (London, 1853-54).

MENDOZA, PEDRO DE (c.1487-1537). A Spanish explorer. He was of a noble family high in the favor of the Emperor Charles V. In 1529 he offered to explore South America at his own expense and establish colonies. He was made military governor of all the territory between the Río de la Plata and the Strait of Magellan, and the Emperor gave 2000 ducats and advanced 2000 more on the condition that within two years Mendoza should transport 1000 colonists, build roads into the interior, and build three forts. He was to have half the treasure of the chiefs killed and nine-tenths of the ransom. The office of Governor was also made hereditary. In 1534 with a considerable fleet he set sail, but a terrible tempest scattered it off the coast of Brazil. Here his lieutenant, Osorio, was assassinated, according to some authorities by the orders of Mendoza himself because of suspected disloyalty. Mendoza sailed up the Río de la Plata and founded Buenos Aires in 1535. Pestilence broke out, and the natives became unfriendly. His brother Diego, who led a force against the hostile tribes, was killed with three-fourths of his men. A general conspiracy of the natives was formed, and the city was captured and burned. Another brother, Gonzalo, arrived with reinforcements and founded the city of Asunción in Paraguay in 1536. Mendoza, disappointed and broken in health, embarked for Spain, but died a maniac during the voyage, in 1537.

MENEDEMUS (Lat., from Gk. Μενέδημος) (c.350-c.277 B.C.). A Greek philosopher, a native of Eretria. According to some authorities, he studied under Plato (to this statement chronological difficulties are opposed); according to

others, under Stilpo at Megara and under Phædo of Elis. He founded the Eretrian school of philosophy and was also one of the leading men in the political affairs of his state. If we may trust the testimony of the ancients, especially Cicero, the philosophy of Menedemus closely resembled that of the Megarian school. Consult Ritter-Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913).

MEN'ELA'US (Lat., from Gk. *Menélaos*). In ancient Greek legend, a king of Lacedæmon, the younger brother of Agamemnon and husband of the famous Helen. The abduction of his wife by Paris is represented as the cause of the Trojan War. In the *Iliad* he appears most prominently in the duel with Paris, when the life of the latter is saved only by the divine interposition of Aphrodite, and in the battle over the body of Patroclus, where he is one of the foremost combatants and eventually carries the corpse from the field. He entered Troy in the wooden horse (Vergil, *Æneid*, ii, 264). After the capture of Troy he slew Deiphobus, who had wedded Helen after the death of Paris, and in some versions intended to kill Helen also, but was disarmed by her beauty. After the fall of Troy he sailed with Helen for his own land; but his fleet was scattered by a storm, and he wandered for eight years about the coasts of Cyprus, Phœnicia, Egypt, and Libya. After his return he lived at Sparta with his wife, Helen, in great happiness; he was translated living to Elysium (*Odyssey*, iv, 561). Both Menelaus and Helen were worshiped as gods at Therapne, near Sparta, and it is probable that here, as so commonly in Grecian heroic myths, we have two local deities who have been reduced to hero and heroine. Consult the article "Menelaos," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MENELAUS. A Greek mathematician, who lived c.100 A.D. He wrote a book on the calculation of chords, not now extant, and a work in three books, under the title *Sphærica*. The latter, although not now extant in Greek, is known in Arabic and Hebrew, and in several Latin translations. It is a treatise on spherical triangles, with respect not to their solution, but to their geometric properties. One of the most interesting propositions is that concerning a spherical triangle cut by a transversal, the corresponding proposition for plane triangles being stated as a lemma. This theorem, known by the name of Menelaus, asserts that if the lines of the three sides of a triangle are cut by a transversal, the product of three segments which have no common extremity is equal to the product of the other three. For spherical triangles "the cords of three segments doubled" replaces "three segments." The proposition was often called in the Middle Ages the *regula sex quantitatum*. Menelaus also knew essentially the projective property of the unharmonic ratio of the segments determined by four collinear points.

MENELIK, mēn'ē-lik (1844-1913). A king of Abyssinia, officially *negus negusti* (king of kings, or emperor). He was born in Ankobar, where his father, Ailu Malakoth, was Crown Prince of the Kingdom of Shoa. After his father's death in 1855 Menelik was for 10 years interned in Gojam by Theodore, Ailu Malakoth's rival, who attempted to make peace with him by giving him his daughter to wife. But in 1865 he escaped to Shoa, where he managed to estab-

lish himself, thanks to England's interference in Abyssinia, and as King (or *Ras*) of Shoa had little trouble in defeating the son of John, Ras of Tigre, in 1889 and in coming to the Abyssinian throne, to which he claimed a family right by a supposed descent from King Solomon (by the Queen of Sheba). He showed remarkable ability in bringing his army to a high pitch of efficiency. England's intervention between Italy and Abyssinia had already checked an open break, but when Italy claimed a protectorate by the Treaty of Uchali, Menelik protested in 1893, and in 1896 by the victory at Adowa forced Italy to sign the Peace of Addis Abeba, thus giving up all claim to a protectorate. He came to a complete understanding with Great Britain in 1898. In 1908 he announced that his grandson Lidj Jeassu, then a boy of about 12, would succeed him. In 1910, because of Menelik's ill health, a council of regency was formed. See ABYSSINIA.

MENÉNDEZ DE AVILÉS Y MÁRQUEZ, mā-nān'dāth dā ā'vê-lās' ē mār'kāth, PEDRO (1519-74). The founder of St. Augustine, Fla. He was born at Avilés in Asturias, Spain. Philip II placed him in command of the fleet which escorted the treasure vessels to and from the West Indies. Securing a grant of Florida with the title of Adelantado and Governor, he set sail, June 29, 1565, with 19 vessels carrying 1500 settlers, with orders to occupy the country and expel the French, who were making this their headquarters for privateering. On St. Augustine's Day, August 28, Menéndez discovered the harbor, on whose shores, on September 6, he began to build a fort, around which the present city of that name has grown up. Here the French Huguenots under Ribaut (q.v.) attacked him, but a hurricane drove them off, and before they could return to their settlement at Fort Caroline on the St. John's River, Menéndez attacked that post and massacred 142 of the garrison. The French fleet meanwhile had been wrecked, and the crews were forced to surrender to Menéndez, who put 180 of them to death. In 1567 Menéndez returned to Spain, and during his absence, in April, 1568, his colony was attacked by a French fleet under Dominique de Gourgues, who hanged a number of Spaniards. Meanwhile Menéndez had already started back, sailing from San Lucas on March 13 with supplies and reinforcements, with which he reestablished St. Augustine. He had been appointed Governor of Cuba, and his efforts during the next few years were mainly devoted to that island and the gulf mainland. In 1570 he sent an expedition to the Chesapeake, which ascended the Potomac and built a chapel on the Rappahannock, where the party were killed by the Indians. In 1572 Menéndez revisited Florida and went on to the Chesapeake, where he captured several Indians supposed to have taken part in the massacre of his colony two years previously and hanged them. Philip II soon after this recalled him to Spain, where he died at Santander, Sept. 17, 1574. Consult Justin Winsor, *Narrative and Critical History of America*, vol. ii (New York, 1886), which contains also a critical essay on the sources of information.

MENÉNDEZ PIDAL, mā-nān'dāth, JUAN (1861-1915). A Spanish archivist, juriconsult, historian, and poet, brother of Luís and Ramón Menéndez Pidal. Born at Madrid, he studied law until he obtained his title, and then devoted himself to journalism. His *Dios y el César*, an ecclesiastical and legal study of the re-

lations of church and state, attracted much attention. He first published two legends: *El conde de Muñázán* (Burgos, 1880) and *D. Nuño de Rondaliegos*; the latter, by a tour de force, written in Old Castilian. His *Alla-lá* (1890) is a defense of Asturian literature from the general attacks on regional literature. Previous thereto he had published (Madrid, 1885) a much more important work, *Poesía popular: colección de los viejos romances que se cantan por los asturianos en la danza prima, esfozazas, y filandones, recogidos directamente de boca del pueblo*. Other works of importance are: *San Pedro de Cardena*; *D. Francesillo de Zúñiga*; *Las leyendas del último rey godo* (1906), a masterly study which exhausts the subject; *Poesías* (1913). Long a director of the Archivo Histórico Nacional at Madrid, and a director of the Revista de Archivos, Bibliotecas, y Museos, in 1914 he was elected a member of the Spanish Royal Academy of the Language.

MENÉNDEZ PIDAL, LUIS (?1860-). A Spanish genre painter, brother of Juan and Ramón Menéndez Pidal. Born at Oviedo, he studied in the School of Bellas Artes at Madrid and took part in the National Exposition held there in 1887. In the exposition of 1890 he won a second-class medal for "A buen juez mejor testigo," and another picture attracted the attention of the Queen Regent, who bought it. In 1892 his "La cuna vacía," when published in *El Liberal*, obtained the first-class medal without a dissenting vote. His "Salus infirmorum," hung in the General Exposition of Bellas Artes at Madrid in 1899, won a first medal. His style is eminently personal, and he is considered one of Spain's best colorists. He chooses by preference country scenes and those of family life, especially such as show the family affections; but he is also a good portraitist. In 1906 he was elected a member of the Royal Academy of Bellas Artes de San Fernando.

MENÉNDEZ PIDAL, MARÍA GOYRI DE (1873-). A Spanish Hispanist, wife of Ramón Menéndez Pidal. Born in Madrid, she began her studies there in the normal and business courses of the Association for the Education of Women. Later, despite the difficulties due to the unusualness of the proceeding, she studied philosophy and letters in the University of Madrid, obtaining the titles of normal school professor (1893), licentiate in philosophy and letters (1896), and doctor of philosophy and letters (1909). Among her publications are the following: "Romance de la muerte del Príncipe D. Juan," in the *Bulletin Hispanique*, vol. iv (1902); "Romances que deben buscarse en la tradición oral," in *Revista de Archivos, Bibliotecas, y Museos* (1907); various articles on "El Conde Lucano," in *Revue Hispanique* (1899); *Romania* (1900), and *Revista de Archivos, etc.* (1902); "La difunta pleiteada en la literatura española: estudio de literatura comparada," in *Revista de Archivos* (1909).

MENÉNDEZ PIDAL, RAMÓN (1869-). A Spanish philologist, born at Coruña, March 13, 1869. He studied at the universities of Madrid (under Marcelino Menéndez y Pelayo, q.v.) and of Toulouse and after 1899 held the chair of Romanic philology at Madrid. In addition he lectured in Spain, South America, and the United States. At Johns Hopkins he delivered the Turnbull lectures in 1909, published the next year as *L'Épopée castillane à travers la*

littérature espagnole; and his Hispanic Society lectures at Columbia (1909) appeared as *El romancero español*. His interest in education led to his being made a member of the board created in 1907 for the advancement of university work in Spain (the Junta para Ampliación de Estudios), director of the summer session of the board, and (1913) Counselor of Public Instruction for the Kingdom. His varied public service included a journey to Quito and Lima in 1904-05 as Royal Commissioner to investigate the claims in the Peru-Ecuador boundary dispute. Menéndez Pidal is to be compared with Friedrich Diez and Gaston Paris (qq.v.). His services were recognized by membership in the Spanish Royal Academy of the Language, the Royal Academy of History, Madrid, and the Hispanic Society of America, among other learned bodies at home and abroad. From 1906 to 1909 he was editor of the philological section of *Cultura Española*, and later he undertook the editorship of the *Revista de Filología*. His *Gramática y vocabulario de poema del Cid* and *Leyenda de los infantes de Lara* were awarded prizes by the Spanish Royal Academy of the Language and the Royal Academy of History, respectively, in 1895 and 1897. His *Gramática histórica española* (2d ed., 1905) is his most important work. Other writings include: *Leyenda del Abad Don Juan de Montemayor* (vol. ii, *Gesellschaft für romanische Literatur*, 1903); *Primera crónica general* (vol. v, *Nueva biblioteca de autores españoles*, 1906); *Cantar de mio Cid* (3 vols., 1908-11); *Cancionero de romances impreso en Amberes sin año* (1914). A critical bibliography entitled *Obras de D. Ramón Menéndez Pidal* (Madrid, 1912) fills 35 pages and is complete to the time of its appearance.

MENÉNDEZ Y PELAYO, PÁ-LÁ-YÓ, MARCELINO (1856-1912). A Spanish historian of philosophy and letters. He was born at Santander, Nov. 3, 1856, and studied at the universities of Barcelona (where he was a pupil of Manuel Milá y Fontanals, q.v.) and Madrid. At Madrid he was appointed professor of philosophy and letters when 22, and at 25 he was admitted to the Spanish Royal Academy of the Language (which, strangely, never made him president). His precocity developed into a ripe scholarship, so that he came to be regarded as one of the greatest humanists of the nineteenth century. After 20 years of teaching he accepted the directorship of the National Library, keeping in touch with academic life by lecturing frequently at the Madrid Athenæum. Menéndez y Pelayo was famous for his insatiable appetite for books and his wonderful memory. He appeared to read everything and to make all that he read a part of his mental acquisition. This, however, will not account entirely for the quantity and nature of his published work. Of his nationality and the fact that he was a Catholic he was equally proud; his patriotism and religious fervor together made him a tireless defender of traditional Spain. As a critic, he held himself at the service of any student or scholar who needed his services. Nor was he destructive in his criticism—he first pointed out defects that he found in a work and then went on to search for and generously to recognize all its good qualities. Among his pupils who afterward became distinguished were Ramón Menéndez Pidal and Adolfo Bonilla y San Martín (qq.v.). As a writer of both prose and verse, Menéndez y Pelayo exercised a most wholesome influence on

the younger generation by the quality of high seriousness always present in his work. He was appointed dean of the Faculty of Letters at Madrid University, chief of the Board of Archivists, and Counselor of Public Instruction; was elected Deputy in the Cortes and Senator; became a member of the academies of Moral and Political Sciences, Fine Arts (San Fernando), and History (librarian and director), besides being honored by societies at Lisbon, Barcelona, and Seville and receiving the grand cross of the Order of Alfonso XII. He died May 19, 1912, at Santander.

The literary activity of Menéndez y Pelayo, beginning with various studies that won prizes in the literary tournaments at which they were presented, finally placed him at the head of Spanish critics of literature and philosophy. His two greatest works are his critical histories of philosophy, entitled *Historia de los heterodoxos españoles* (3 vols., 1880-82) and *Historia de las ideas estéticas en España* (1883-91). His editorial work includes: *Antología de poetas líricos castellanos* (13 vols., 1890-1908); *Obras de Lope de Vega* (15 vols., 1890-1902); *Antología de poetas hispano-americanos* (4 vols., 1893-95). In the same field as the last named he published *Historia de la poesía hispano-americana* (1911). *Horacio en España* (1885) and *Bibliografía hispano-latina* (1902) are representative of his classical researches. Poetical, dramatic, and miscellaneous writings, both originals and translations, appeared as *Odas, epístolas, y tragedias* (1883; 2d ed., 1906).

Bibliography. *Revista de Archivos, Bibliotecas, y Museos* (double number dedicated to Menéndez y Pelayo, July-August, 1912); Andrés González-Blanco, *Marcelino Menéndez y Pelayo, su vida y su obra* (Madrid, 1912); Luis Antón del Olmet and Arturo García Carraffa, *Los grandes españoles*, vol. iii (ib., 1913); Adolfo Bonilla y San Martín, *Marcelino Menéndez y Pelayo, 1856-1912* (ib., 1914); id., an article bearing the same title and serving as Introduction to vol. xxi (1915) of the *Nueva biblioteca de autores españoles*, which contains a detailed bibliography. Vol. xxi of this work constitutes vol. iv of Menéndez y Pelayo's *Orígenes de la novela*. Publication of the definitive edition of his *Obras completas* was begun at Madrid in 1911.

MENEPTAH, or **MERNEPTAH** (Egypt. *Meri-en-Ptah*; Beloved of Ptah; Lat. *Amenephtes*; Gk. Ἀμμενεφθίς, *Ammenephtis*). A king of Egypt, the son and successor of Ramses II (q.v.). He reigned for some 20 years about the middle of the thirteenth century B.C. and, in the fifth year of his reign, repelled a formidable invasion of Libyans and pirates. He built largely at Tanis and left monuments in various parts of Egypt. Formerly there seemed to be good grounds for identifying this King with the Pharaoh of the Exodus, but an inscription, discovered in 1896, mentions Israel as settled in Palestine in the fifth year of Menepthah's reign, and the identification is therefore impossible. The text of this interesting inscription, which contains the only mention of Israel to be found on the Egyptian monuments, was published with a German translation by Spiegelberg, in the *Zeitschrift für ägyptische Sprache*, vol. xxxiv (Leipzig, 1896), under the title "Der Siegeshymnus des Merneptah auf der Flinders Petrie Stele." The mummy of Menepthah was found at Thebes in 1898, and is now in the Museum of

Cairo. Consult E. A. T. W. Budge, *A History of Egypt* (New York, 1902), and J. H. Breasted, *A History of Egypt* (2d ed., ib., 1909). See also EGYPT.

MENES, mē'nēz (Egypt. *Meni*; Gk. *Mḗn, Mēn, Mḗns, Mēnēs*). A king of Egypt whom the Egyptians regarded as their first historical monarch. His name invariably stands at the head of all monumental lists of Egyptian kings, but little is known in regard to him. According to Manetho he was a native of This, and reigned for 62 years. Herodotus and other Greek writers attribute to him the foundation of Memphis and relate many other fables concerning him. But the list of Saqqara begins with the sixth king of the first dynasty. This may invalidate Menes's claim as founder of Memphis. In modern times certain scholars have believed that he was the Pharaoh who united Upper and Lower Egypt under a single monarchy, but recent discoveries indicate that the union took place at an earlier date. At present there is a tendency to identify Menes with an early king of whom many small memorials have been found near This. Two large tombs—one at Naggadah, near Coptos, the other near Abydos—are filled with objects bearing the name of this King. The reading of the name is, however, not altogether certain, and the proposed identification is therefore doubtful. Consult: *Sitzungsberichte der Berliner Akademie der Wissenschaften* (Berlin, 1897); *Revue Critique* (Paris, 1897); *Zeitschrift für ägyptische Sprache*, vol. xxxvi (Leipzig, 1898); E. A. T. W. Budge, *A History of Egypt* (New York, 1902); J. H. Breasted, *A History of the Ancient Egyptians* (ib., 1908).

MENEVILLE, FÉLIX EDOUARD GUÉRIN-. See GUÉRIN-MENEVILLE, F. E.

MENFI, mēn'fē. A town in the Province of Girgenti, Sicily, 30 miles south by east of Marsala. It exports corn, wheat, barley, cotton, oil, and wine. The quarries of the vicinity are supposed to have furnished the building material for the temples of ancient Selinus. Pop. (commune), 1901, 10,281; 1911, 11,189.

MENGELBERG, mēng'el-bērg, WILLEM (1871-). A Dutch orchestral conductor, born in Utrecht. He received his first musical education in his native town and then entered the Cologne Conservatory, where Wüllner, Seiss, and Jensen were his teachers. In 1891 he began his career as municipal music director at Lucerne. In 1895 he went to Amsterdam as conductor of the Concertgebouw Orchestra, which under his energetic leadership soon became one of the finest orchestras in Europe. During the season 1905-06 he was one of the guest conductors of the New York Philharmonic Society. In 1907 he was called to assume the leadership of the Museums-konzerte in Frankfurt. Extensive tours took him through all European countries. As an interpreter of the works of Richard Strauss he became especially distinguished.

MENG'ER, KARL (1840-). An Austrian economist, born at Neu-Sandez in Galicia. He studied law and political science in Vienna and Prague, and after 1872 was identified with the University of Vienna, in 1879 becoming full professor of political economy. In 1900 he was made a life member of the Austrian House of Peers. The leader of a reaction against the historical method in economics, he became one of the most prominent leaders of the so-called Austrian school of political economy. His most important work, from a theoretical standpoint, is

Grundsätze der Volkswirtschaftslehre (1871). Other important works are: *Untersuchungen über die Methode der Sozialwissenschaften und der politischen Oekonomie insbesondere* (1883); *Die Irrtümer des Historismus in der deutschen Nationalökonomie* (1884); *Beiträge zur Währungsfrage in Oesterreich-Ungarn* (1892). His article "Geld" in the *Handwörterbuch der Staatswissenschaften* (3d ed., 1909) is regarded by competent authorities as the best brief exposition of the money question in existence.

MENGES, mēngs, ANTON RAPHAEL (1728-79). A German historical and portrait painter. He was born at Aussig, Bohemia, March 12, 1728, the son of Ismael Menges, a miniature painter of some repute, who in 1741 took him to Rome. On his return to Dresden in 1744 he was appointed court painter by the Elector Augustus III, who permitted him to continue his studies at Rome. There he painted the first of his large compositions, a "Holy Family," now in the Gallery of Vienna, and of additional interest because the model for the Madonna was Marguerita Guazzi, a beautiful peasant girl whom he married, and for whose sake he embraced Roman Catholicism. The financial distress occasioned by the Seven Years' War caused his pension to be stopped, but he received numerous commissions from the art patrons of all nationalities, among others the Duke of Northumberland, who employed him to paint a copy of Raphael's "School of Athens." In 1754 he was made director of the new Art Academy on the Capitol; in 1757 he painted the ceiling in San Eusebio, and soon afterward the celebrated "Mount Parnassus" in the Villa Albani. In Rome also he became the intimate friend of the great art critic Winckelmann.

On a visit to Naples he attracted the attention of the King, who, on his accession to the throne of Spain as Charles III, invited Menges to Madrid. During this first sojourn at Madrid (1761-69) he executed several frescoes in the Royal Palace, of which "Aurora and the Four Seasons" is the best. Intrigues against him and feeble health caused his return to Italy, but he was summoned back to Madrid in 1774 to complete his work in the Royal Palace. He painted there the "Apotheosis of Trajan," his most important fresco, and the "Temple of Fame." In 1777 he returned to Rome, where he died, June 29, 1779.

His fresco paintings are superior to his canvases. Good examples of the latter are a "Nativity" in Madrid, an "Annunciation" in the Vienna Gallery, and the "Ascension" in Dresden. The Dresden Gallery contains a number of his pastels, including portraits of himself and his father. Menges was an eclectic who endeavored to blend the beauty of antique art with that of the great Italian masters. Living at a time of extreme degradation in art, he commanded great admiration by his skill in composition and his thorough knowledge of technical processes, but his color was cold and lacked the fire of genius. He exercised a profound influence upon his contemporaries by his writings on eclectic art, as well as by his paintings, and trained numerous pupils. Consult Woermann, *Ismael und Raphael Menges* (Leipzig, 1893).

MÈNG-TSE, mūng-tsé'. See MENCUS.

MENGTSZE, mēng-tsé'. A town in the Province of Yunnan, China, situated amid mountains at an elevation of about 4600 feet, about 40 miles from the frontier of Tongking (Map: China, H 7). It is a well-built city with traces of its splendor and importance before the Taiping Re-

bellion. It was opened to foreign commerce in 1889 in accordance with the French Treaty of Tientsin of 1886. The trade is mostly transit and with Hongkong. The merchandise is transported by the Red River as far as Manhas, a village on the left side of the river about 40 miles from Mengtsze, and from there is carried by coolies and pack animals inland. The chief exports are tin from the adjacent mines and opium; textiles and tobacco are imported. Mengtsze is connected by telegraph lines with Yunnanfu and the frontier of Tongking. The French government has obtained a concession for the construction of a railway line from Laokai on the frontier to Yunnanfu via Mengtsze. Pop., 1912, est., 11,000. In 1912 net foreign imports amounted to 7,721,840 taels and exports to 11,847,849 taels, a total trade for the year of 19,569,689 taels (in 1912 a tael was equal to 74 cents United States gold).

MENHADEN, mēn-hā'den (corrupted from Narragansett Indian *munnawhatteaúg*, fertilizer, in allusion to its use as a fertilizer in the cornfields). A small fish (*Brevoortia tyrannus*), closely related to the shad (q.v.), which is caught in great quantities on the eastern coast of North America during the summer months. Its length varies from 12 to 18 inches; the color of the upper parts is greenish brown, with a black spot on the shoulder, the belly silvery, and the whole surface iridescent. The flesh is not highly esteemed as food and is very full of small bones; but it is rich in oil and nitrogen.

Economic Uses. The menhaden is one of the most interesting and valuable of American sea fishes, and its catching and utilization give occupation to a large amount of capital and number of men and vessels. (See FISHERIES.) It is extremely irregular in its movements and numbers, migrating into deep water or to warm latitudes on the approach of cold weather and reappearing north of Cape Hatteras with advancing warm weather. In some years it has been extremely numerous as far north as Nova Scotia; while there have been periods when the fish seemed to have forsaken America altogether. It appears alongshore in schools, which may contain a million or two of fishes, swimming near the surface. With ordinary care such a school may be surrounded by a net, operated from two rowboats, and then hauled to the ship's side, where the net is pursed and the fish are dipped out and thrown into the hold. A catch of half a million is not unusual. Formerly small sailing vessels were altogether used, but since about 1875 high-powered, tuglike steamers have mostly replaced them. All along the shore from the Carolinas to eastern Maine are factories where these loads of menhaden are sold. Their bodies yield oil of a superior sort, useful for every purpose to which any fish or whale oil may be applied. This is obtained by boiling and pressing. (See OIL.) From the residue is made a nutritious animal food called fish meal, and a highly nitrogenous ingredient of artificial guanos. In early times, following the example of the Indians, the fish themselves used to be spread upon the farms near shore and plowed into the soil; but it was found that, apart from the extremely disagreeable taint this gave to the air of the whole region, the soil was injured by saturation with oil.

Great quantities of menhaden are also used as bait in the Banks fisheries; are sold fresh in the markets, very cheaply; and are salted for do-

mestic use or to be exported to the West Indies; and the young are extensively canned in oil as "American sardines" and "shadines." The fish has, however, a still higher economic value in serving as the food of other fishes important to us. It itself subsists mainly upon minute vegetable material contained in the mud of bays and soft shores, and is enormously fecund.

FISH LOUSE OF THE MENHADEN.

A degraded entomostracan parasite (*Lernaeonema radiata*); the "rooted" head is at the right.

Every predacious animal in the sea eats menhaden. Goode estimated that the total number of menhaden devoured by fishes annually could only be counted by millions of millions, and he declared that were the menhaden to disappear three-fourths of the value of the American fisheries would instantly vanish.

The menhaden is known by an extraordinary number of different names: as pogey in Maine; bony fish in eastern Connecticut; whitefish in western Long Island Sound; bunker, a shortening of mossbunker (q.v.), about New York and New Jersey; bugfish or bughead in Delaware and Chesapeake bays, referring to a parasitic crustacean (see PARASITE, ANIMAL) in the mouths of the southern menhaden; and farther south as fatback, yellowtail, and savega—the last the Portuguese term in South America. The menhaden of the Gulf of Mexico is a variety locally called alewife, herring, etc.; and other varieties extend the range of the species to Brazil.

Consult: G. B. Goode, "The Menhaden," an elaborate memoir, in *Report of the United States Fish Commission*, part v (Washington, 1877), and a more condensed account in *Fishing Industries*, sec. i (ib., 1884); W. E. Hathaway, *Effects of Menhaden Fishing upon the Supply of Menhaden and of the Fishes that Prey upon them* (ib., 1910). For a picturesque account of catching menhaden, see "Around the Peconics," in *Harper's Magazine*, vol. lvii (New York, 1881). See FISHERIES; Plate of HERRING AND SHAD.

MENHIR. See CARNAC; MEGALITHIC MONUMENTS.

MÉNIÈRE'S (mä'nyärz') **DISEASE.** A condition marked by sudden and complete loss of hearing and attended with nausea, vomiting, tinnitus, twitching movements of the eyeball (nystagmus), and vertigo. There is as a rule no previous history of ear disease, the tympanic membrane and other auditory tissues being normal in appearance. The condition is thought to be due to hemorrhage into the labyrinth (q.v.). The acute symptoms disappear as a rule within a few days or weeks, but the deafness remains permanent. Unsteadiness of gait and tremulous handwriting persist in some patients for a long time. Treatment has little influence on the disease, but some improvement may be expected from sweats induced by pilocarpine; and iodide of potash given for long periods is supposed to promote absorption of the blood clot.

Ménière's "symptom complex" is a condition similar to the above except that the attacks do not come so suddenly, are apt to be repeated, and there generally exists previous ear disease. The symptoms may be brought on by obstructive lesions in the Eustachian tube or middle ear with a consequent rise of pressure in the labyrinthine fluids. See EAR.

MENILIK. See MENELIK.

MENIN, me-nän'. A frontier town of West

Flanders, Belgium, situated 30 miles southwest of Ghent, on the left bank of the Lys, which here forms the French boundary (Map: Belgium, B 4). It has a handsome church, a bishop's college, manufactures of lace and cotton textiles, tobacco, and a famous old brewery. There are salt baths near by. Menin was taken by the Germans in their envelopment of Belgium during the European War which began in 1914. It was recaptured by the British expeditionary force. The latter were forced to evacuate the town, which they later damaged by an aerial attack. See WAR IN EUROPE. Pop., 1900, 18,611; 1910, 18,636.

MENIN. The ancient name of the island of Terba.

MEN'INGI'TIS. An inflammation of the meninges, the membranes covering the brain and spinal cord. These are three in number: the *pia mater*, lying in contact with the substance of the brain and cord; the *dura mater*, lining the cranial cavity and spinal canal; and the *arachnoid*, a delicate weblike structure lying between the *pia* and *dura*. The term "meningitis" is specifically applied to an inflammation of the *pia mater* of the brain, described in this article under the heading of *Cerebral Meningitis*. Inflammation of the *dura*, whether of the brain or cord, is called *pachymeningitis*, and of the *pia*, *leptomeningitis*. The term "arachnitis" was formerly used on the supposition that the arachnoid might be the seat of an independent inflammatory process, but this is no longer believed to be possible. An inflammation involving the meninges of both the brain and cord is termed *cerebro-spinal meningitis*. For convenience of description the subject may be arranged under the following heads: *pachymeningitis*, involving the *dura* of the brain and cord; *cerebral meningitis*, of which two forms are recognized, tubercular and simple; *spinal meningitis*; and *epidemic cerebro-spinal meningitis*.

Pachymeningitis. This disease occurs in the external or internal form. Inflammation of the outer surface of the *dura mater* is uncommon and occurs nearly always by extension from neighboring disease. Either the cerebral or the spinal *dura* may be attacked. The cerebral form occurs as a consequence of blows and injuries of the skull, erysipelas of the scalp, or tumors of the cranium. A localized external *pachymeningitis* may arise from inflammation of the mastoid cells or middle or internal ear. The spinal form of *pachymeningitis* may be either widespread or localized; it also is due to extension from diseased adjacent structures, such as tuberculosis of the spine. Gowers describes a primary form in young, ill-nourished adults, the exciting cause being usually exposure to cold. The symptoms of *pachymeningitis externa* vary according to the nature and extent of the process. In acute cases severe pain, headache and a rise of temperature, hyperæsthesia, muscular spasms, and stiffness of the neck are seen. The treatment is that of the primary disease. *Pachymeningitis interna* occurs as a rare result of extension of purulent inflammation from the leptomeninges; as a pseudomembranous inflammation during pneumonia (Osler); in a hemorrhagic form; and in a chronic hypertrophic form. The hemorrhagic form is a rare condition and is also known as *hematoma of the dura mater*. In this disease the internal surface of the *dura* is the seat of a peculiar hemorrhagic inflammation, characterized by the formation of adventitious membranes, which appear to be repetitions of the arachnoid, having blood ves-

sels which rupture, the extravasated blood collecting in the form of cysts containing from an ounce to a pound of blood. The symptoms are primarily those of inflammation and secondarily due to pressure. There are some fever, irregularity of the pulse, headache, giddiness, somnolence, gradually deepening to coma; and there may be twitching and convulsions, followed by muscular weakness and paralysis. The disease affects the dura of both brain and cord, but the symptoms referable to the latter are often overshadowed by the cerebral effects. The diagnosis is difficult and the termination almost invariably fatal. The chronic hypertrophic form of internal pachymeningitis occurs in the spinal dura, producing an extensive thickening of the membrane. This in turn causes severe compression of the cord and spinal nerve roots. After a first stage of shooting pains along the course of the nerves affected, with muscular twitchings and spasms, there gradually supervene anæsthesia, paralysis, and atrophy. As the compression increases, paraplegia, secondary degeneration, and rigidity of the paralyzed parts appear. This form of pachymeningitis is due to syphilis, alcoholism, or injury, and is thought by some writers to follow the hemorrhagic form. Treatment consists of counterirritation over the spine, with remedies for the pain and spasms. When the trouble is syphilitic great improvement may be derived from mercurials and potassium iodide or from salvarsan.

Cerebral Meningitis. Acute inflammation of the pia mater of the brain occurs chiefly in two forms—tubercular and simple or purulent. The arachnoid takes part, to a greater or less extent, in the inflammatory process.

Tubercular meningitis occurs at all ages, but is more common in children than in adults. The disease is caused by the *bacillus tuberculosis* and is usually secondary to a tuberculous process in some other portion of the body, e.g., pulmonary phthisis, hip-joint disease, or caries of the spine. The characteristic lesions of the disease are found in the pia mater at the base of the brain or over the optic chiasm, crura, or pons. Tubercles are deposited along the vessels of the pia, which becomes thickened, opaque, and studded with grayish-white granules. There is an exudation of lymph, gray or grayish yellow, but rarely purulent, into the meshes of the membrane in the same portions in which the tubercles exist and extending along the fissure of Sylvius and the middle cerebral artery. The upper surface of the hemispheres is only slightly affected, so that the disease is sometimes called basilar meningitis. The ventricles are generally distended with fluid (whence the old name, acute hydrocephalus), clear, milky, or even bloody. The onset of the disease is often preceded by a period of general ill health. The child is peevish, irritable, with constipation and loss of appetite. The first or irritative stage then sets in suddenly, with a convulsion, or more commonly with vomiting, headache, and fever. The headache is severe and continuous, and the child moans and occasionally utters a sharp cry—the so-called hydrocephalic cry. Sometimes the patient screams until utterly exhausted and has to be kept under the influence of powerful sedatives all the time. There are moderate fever and excessive sensitiveness to light and sound. In the second period of the disease, the stage of depression, the irritative symptoms subside. The child no longer complains of headache, but is dull and apathetic,

drowsy, or slightly delirious. Pulse and respiration are irregular and fever continues. The head is retracted and the neck stiff. If the finger nail is drawn across the skin of the forehead or abdomen a broad red streak appears, the *tache cérébrale*, which may last for five minutes. In the last or paralytic stage all these symptoms are intensified; the drowsiness increases to coma; paralysis of various parts of the body occurs, and death takes place in from 10 days to three weeks after the onset of pronounced symptoms. Few cases recover. Treatment is entirely symptomatic and palliative. An ice cap is put upon the head, and sedatives are given internally.

Simple acute meningitis is as a rule purulent or suppurative. It may be caused by inflammation of neighboring tissues, e.g., otitis, suppurative phlebitis, or abscess of the brain; or may occur as a complication of pyæmia, septicæmia, malignant endocarditis, or the specific fevers, particularly smallpox, typhoid, and scarlatina. The pia mater and arachnoid become infiltrated with purulent material and the brain beneath them is inflamed. The symptoms resemble in a general way those of the tubercular form just described, but the onset and course of the malady are much more rapid. When simple meningitis occurs in the course of other acute illnesses its features may be masked to a certain extent, but in other cases the symptoms begin acutely with a high temperature, chill, severe pain in the head, and vomiting, and the case passes on to convulsions, paralysis, coma, and death. A fatal termination is the rule, but some recoveries occur after a long period of convalescence.

Quinke has described a serous form of meningitis occurring in acute infectious diseases or intoxications or arising spontaneously. It may precede acute purulent otitis media, also, but no microorganisms are found. Lumbar puncture shows that the cerebrospinal fluid is increased in amount and under great pressure; and this procedure may ameliorate or cure the condition if it is not a mere precursor of purulent meningitis.

Spinal Meningitis. The membranes of the spinal cord may be affected separately, but it is common for inflammation to spread from one to the others. Inflammation of the dura, pachymeningitis, has already been described. Acute leptomeningitis, or acute spinal meningitis, as it is called, involving the pia, is often of obscure origin, but is known to be due to exposure to cold, sunstroke, and injuries to the spine; and it sometimes complicates pneumonia, scarlatina, typhoid fever, and septicæmia. Not infrequently a tubercular inflammation accompanies a like process in the cerebral pia mater. The attack begins with the usual symptoms of meningeal inflammation, viz., vomiting, chill, fever, and pain. The pain is in the back; it may be local or general, and it is increased by movement or pressure. There are also shooting paroxysmal pains, radiating along the course of the nerves arising in the affected area, and extreme sensitiveness of the skin and muscles to which those nerves are distributed. Irritation of the anterior nerve roots leads to spasms of the muscles, producing rigidity of the spine with sometimes extreme arching (opisthotonos). In addition there is the usual accompaniment of fever. After a few days the symptoms of irritation give way to paralysis and insensibility, and the disease either proves fatal from exhaustion and failure of the respiratory muscles or lapses into a chronic condition with wasting and shortening of the mus-

cles. Some patients recover after several months, while others ultimately die from bed sores, or from renal or vesical complications. In this form of meningitis the pia mater is reddened and congested and small hemorrhages may occur. An exudation, at first grayish in color, but later purulent and yellow or greenish yellow, takes place into the meshes or upon the surface of the pia, and the spinal fluid is rendered turbid and opaque. The inflammatory process may extend to the substance of the spinal cord (causing myelitis), or to the inner surface of the dura mater, involving of course the arachnoid and gluing the three membranes together. Treatment comprises rest in bed, upon the side or face, active purgation, and cups or leeches along the spine, followed by the application of ice. Internally drugs are given to relieve pain and diminish sensibility. In the chronic stage counterirritants are applied along the spine, and mercurials or iodides are administered. During convalescence tonics, massage, cold douches, and the electric current are of great service.

Chronic leptomeningitis may be a continuation of the acute form or it may be chronic from the beginning, and has been attributed to cold and exposure, syphilis, chronic alcoholism, and injury. It often occurs in connection with degenerative processes of the cord itself. The condition is one of gradual thickening of the pia mater with compression and atrophy of the nerve roots. The symptoms are the same as in the acute form, with the difference that they come on gradually and there is no fever. Muscular spasm and rigidity are less marked.

Epidemic Cerebro-Spinal Meningitis has been known only since the beginning of the nineteenth century, being first recognized in Geneva, Switzerland. It made its first appearance in America in Massachusetts in 1802. Many severe epidemics have since occurred both in Europe and America. The disease visited Ireland in a very fatal form in 1846 and again in 1866-68. It is a specific infectious disease due to a micro-organism, the *diplococcus intracellularis* of Weichselbaum. The diplococcus has been found in the secretions of the nose, eye, bronchial tubes, joints, and in the blood. Infection is believed to spread through contact with mucous secretions of the upper respiratory tract. Epidemics occur most frequently in winter and spring, and the disease has assumed its most fatal type during times of famine and among squalid tenement dwellers or soldiers in crowded barracks. The changes observed in the meninges are those characteristic of a widespread and severe leptomeningitis. The pia mater is intensely congested and its blood vessels dilated. Pus and lymph are abundant on the convex surface of the brain, along the large blood vessels, and in the fissures. The ventricles contain turbid serum or pus. Small hemorrhages and sometimes abscesses are found in the cortex of the brain. There is in addition congestion of the lungs, liver, spleen, and kidneys. Several clinical varieties of the affection have been noted and the course and symptoms vary remarkably in the different types. In the malignant or fulminant type the disease may prove fatal in a few hours. The abortive type presents only a few symptoms and is characterized by rapid recovery. Remittent and intermittent forms are recognized in which the fever is lower or entirely absent for two or three days, and there is a form that much resembles typhoid fever. The average duration of the disease is three or four weeks, and the

mortality from 30 to 70 per cent in the different epidemics. As might be expected from the extent of tissue involved, the symptoms are very numerous and diverse. No single set of symptoms occurs in all cases. In some there is an indefinite premonitory stage, with malaise, nausea, and headache; but usually the onset is sudden, with a chill, severe headache, vomiting, pains in the back and limbs, and fever. With these manifestations comes stiffness of the muscles of the neck and back, so that the head is retracted and the back arched. Inability to extend the legs fully when the thigh is bent at right angles to the trunk (Kernig's sign) is an important diagnostic phenomenon. There are also pains in the lower extremities and hyperæsthesia of the skin. In addition to these symptoms due to irritation of the spinal nerve roots there are others referable to implication of the cranial nerves. These are, in different cases, drooping of the eyelids (ptosis), squint, contraction, dilatation, or inequality of the pupils, or spasms of the facial muscles. The temperature runs a very irregular course. An important feature of the disease is the occurrence in many cases of a herpetic eruption or petechial or purpuric spots, whence the names spotted fever and petechial fever. Recovery is apt to be marked by the occurrence of many disagreeable sequels. Deafness is common and sight is often impaired. Chronic hydrocephalus with headache, muscular weakness, and mental deficiency occurs in a few instances. Lumbar puncture may relieve headache and delirium and is useful as a diagnostic procedure and as a preliminary to the introduction of Flexner's serum or urotropin. The serum may also be injected directly into the lateral ventricles of the brain when, as frequently happens in meningitis, communication between the cerebral and spinal centres is shut off. Great reduction in mortality is claimed from serum treatment. Consult: Koplik, *Diseases of Infancy and Childhood* (Philadelphia, 1910); an article by the same author on epidemic cerebrospinal meningitis in Osler's *Modern Medicine* (New York, 1914); Flexner, "Results of Serum Treatment in 1300 Cases of Epidemic Meningitis," in *Journal of Experimental Medicine* (New York, May, 1913).

Cerebro-Spinal Meningitis, BLIND STAGGERS, FORAGE POISONING, BORNA DISEASE. A disease of horses characterized by inflammation of the membranes of the brain and spinal cord and the adjacent nerve tissue. It has been considered by some authors to be infectious, owing to an occasional epizootic-like outbreak. Others consider toxic fungi on forage to be the cause. Recent investigations have failed to determine the specific cause and it still remains an obscure and puzzling problem.

Occurrence.—The disease has occurred throughout Europe and outbreaks from time to time become widespread in the United States causing heavy loss, as was the case in the Kansas and Nebraska outbreak of 1913, while at other times there are only sporadic cases.

Symptoms.—Disturbance of the appetite, depression, and weakness are in most cases the first manifestations observed. The characteristic symptoms of the disease soon disappear. There are difficult swallowing, drooping of the head, and sleepiness which may give way to excitement and attacks of vertigo. Impairment of vision is noted, with loss of coördination, resulting in a staggering gait or reeling while standing. There are muscular twitching, cramp of certain muscles,

chiefly of the neck and flanks, and grinding of the teeth. Sometimes colicky pains are noted. If in an open space, the animal will walk in a circle, sometimes to the right, at other times to the left, and will try to push through any obstacle with which he comes in contact. If the temperature is taken at the beginning of the disease it will be found to be from 103° to 107° F., but within 24 hours the temperature gradually falls until it reaches normal and then becomes subnormal. The animal is often down on the second or third day and may or may not get up when urged to do so. Coma or somnolence may be marked in animals going down within the first few days. Those which remain standing may become violent or delirious, but ordinarily the horse is tractable and easily managed. Death usually occurs in from four to eight days, although in the acute form death may follow within 10 or 12 hours after the first symptoms are observed, while in chronic cases the disease may last two or three weeks. The prognosis is very unfavorable, as 85 to 90 per cent of the affected animals die in the beginning of the outbreak, but later the cases become milder, with a consequent drop in the mortality. There are no constant post-mortem lesions in the vital organs, the most important alterations being found in the membranes of the brain.

Treatment.—It appears to be the consensus of opinion of practically all investigators that the disease can be controlled effectively only by a total change of feed and forage; i.e., by preventive measures and not by medicinal treatment. That there is direct connection between ingestion of green forage, exposed pasturage, newly cut hay and fodder, and the development of the disease is quite obvious, and that the ingestion of such forage when contaminated is the most important factor is equally obvious, since almost 100 per cent of the cases in Kansas and over 95 per cent of the cases in Nebraska of which there is any record were maintained all or part of the time under such conditions. Medicinal treatment has proved unsatisfactory in the vast majority of cases. However, the digestive tract should be thoroughly cleaned out through the use of active and concentrated remedies given subcutaneously or intravenously. Arecolin given subcutaneously in half-grain doses has given as much satisfaction as any other drug. After purging the treatment is mostly symptomatic. The horse owner should beware of all kinds of drug specifics, serums, and vaccines unless recommended by a reliable veterinarian.

Consult R. W. Hickman, *Epizootic Cerebro-Spinal Meningitis of Horses* (Washington, 1906), and J. R. Mohler, *Cerebrospinal Meningitis* (ib., 1914). See MEGRIMS.

MÉNIPPÉE, mā'né'pá'. A political satire in prose and verse, published in France in 1594, directed against the Catholic League and in favor of political religious toleration. The name is borrowed from the *Satira Menippea* of the Roman satiric poet Varro, who had taken as a model the Greek cynic Menippus, Diogenes' pupil. Its full title was *De la vertu du Catholicon d'Espagne et de la tenue des Etats de Paris*. It was the joint work of Leroy, Gillot, Passerat, Rapin, Chrestien, Pithou, and Durant, chiefly lawyers. It ostensibly reports an assembly of the states at Paris, with a satirical introduction and a burlesque close, and is the best travesty of its kind in any language before Butler's *Hudibras* (1663). Its political effect was immediate

and lasting. The *Ménippée* is well edited by Labitte (1801). For a clear analysis of this satire, consult Suchier and Birch-Hirschfeld, *Geschichte der französischen Litteratur* (Leipzig, 1900).

MENIPPUS (Lat., from Gk. Μένιππος) (c.250 B.C.). A Greek philosopher of the Cynic school, born at Gadara, in Syria. He is said by Diogenes Laertius to have been a slave by birth, and to have acquired considerable wealth, the loss of which caused him to hang himself. His writings, now completely lost, were a medley of prose and verse in which he satirized the follies of men, particularly of philosophers. These were the model for Varro's *Menippean Satires*, as well as for satires of Meleager and Lucian. See MÉNIPPÉE. Consult Rudolf Helm, *Lucian und Menipp* (Leipzig, 1906), and Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911).

MENKEN, mēn'ken, ADAH ISAACS (1835-68). An American actress, born at New Orleans, La. Her maiden name was Dolores Adios Fuertes. She made her début as a danseuse at the New Orleans French Opera House and subsequently appeared in Cuba and New Mexico. In 1858 she took part in *Fazio* in her native city; played with great success the rôle of Mazeppa in England in 1863-64; and appeared at Paris in *Les pirates de la Savane* in 1866. Subsequently she played in Vienna and again in London and Paris. She was noted as a woman of extraordinary beauty, culture, and brilliancy. She was married successively to Alexander Isaacs Menken, musician (1856), John C. Heenan, pugilist (1859), Robert H. Newell, humorist (1863), and James Barclay (1866). A volume of poetry by her was published as *Infelicia* (1868).

MENNONITES. A denomination of evangelical Protestant Christians which arose in Switzerland in the sixteenth century but took its name from Menno Simons, who was the leader of the sect in Holland. The beginning of the sect was in a congregation formed in Zurich in 1525 by Conrad Grebel and his associates, Manz and Blaurock. Stress was laid upon discipline rather than dogma; abstinence from the vanities of the world was imposed; and (the state being regarded as unchristian) the principle of refusing to participate in civic duties, to bear arms, and to take oaths was upheld. The movement begun at Zurich extended through Switzerland and into southern Germany and Austria. The attitude of its adherents towards the state exposed them to persecution, which continued in Switzerland through the whole of the sixteenth century and provoked emigrations into Moravia and Holland. The Anabaptists (q.v.) were active in Westphalia at the same time, and, professing some of the same views with Grebel's followers, gave occasion for the introduction of heresies and troubles. After the Anabaptist disaster at Münster Menno Simons (q.v.) became a leader among the followers of Grebel and placed their movement upon a sounder footing. He organized congregations in northern Germany and Holland, and by virtue of his piety, discretion, and ability made such an impression upon the body that, although he was not its founder, his name became identified with it. The Mennonites, like the Waldenses, were lovers of peace. The Mennonite Confession of Faith, in 18 articles, was adopted in Holland in 1632. It embodies the usual evangelical doctrines concerning God, the fall of man, the authority of the Scriptures, re-

penitence, and baptism, and contains articles relating to discipline and conduct. The view taken of the Lord's Supper accords with that of Zwingli. In the United States the sacrament is observed twice a year, usually in the spring and fall, the communicants having been previously examined concerning their spiritual condition. The rite of foot washing (q.v.) is observed in connection with it. Baptism, which is only upon confession of faith, is administered by pouring. After baptism the kiss of peace is given by the minister, or by a representative sister, if the convert is a woman. Correct discipline and rectitude are considered more important elements in the Christian life than learning and the elaboration of doctrinal points. Divorce is condemned, except for adultery. The bearing of arms and taking of oaths are regarded as wrong, and the holding of offices under the state is not encouraged. The church polity is congregational, with bishops, priests or elders, and deacons.

The Mennonite church has been divided in both Holland and Switzerland. The different branches in Holland were reunited in 1801. A division took place in Switzerland in 1620 between the Upland and Lowland Mennonites when Jacob Amen, of the Bernese Alps, held that excommunication of one party dissolved the marriage tie, and proscribed the use of buttons and the trimming of the beard. Traces of this separation are found in the United States and Canada in the Amish congregations.

The first settlement of Mennonites in the United States was made in 1683, when immigrants, induced by William Penn's offer of religious liberty, settled in Pennsylvania and built a church in Germantown, on a spot still occupied by a Mennonite meetinghouse. Another considerable immigration has taken place from southern Russia since 1871, the immigrants establishing colonies in the United States (Minnesota, Dakota, and Kansas) and Canada. So far as it is possible to ascertain, the Mennonites had in 1914 in the United States 57,337 communicants, with 1413 ministers and 736 churches. They are divided among 12 branches, which differ on points of doctrine, ritual, and discipline, or in historical origin.

I. The oldest and largest of these branches is the **Mennonite church**, the members of which are represented in 17 States, but most largely in Pennsylvania and Ohio. Their 289 churches, with 430 ministers and 23,169 communicants, are for the most part affiliated with some of the 12 district organizations, but a few of them are independent. A publishing house is established at Scottdale, Pa., where a weekly newspaper in English, the *Gospel Herald*, Sunday-school and children's periodicals, Mennonite historical and doctrinal works, and other books are published.

II. The **Bruederhoef Mennonite church** traces its origin to Jacob Huter, who was burnt at the stake at Innsbruck, Tirol, in 1536. It was at one time represented by 24 communities in Moravia, whence they were driven to Hungary. They removed to Rumania in 1767 and two years afterward to Russia, and finally, in 1874, to the United States, where they settled in South Dakota. They live under the communal system. Their language is German and their books, preserved in manuscript, including their history (*Gemeinde-Geschichtsbuch*), are in that tongue. Their 20 congregations have about 1000 communicant members and are served by 32 ministers.

III. The **Amish Mennonite church** originated in the division already mentioned, which took place in Switzerland in 1620, and represents the Oberland Mennonites, or followers of Jacob Amen, of the Bernese Alps, after whom it is named. It is second in importance among Mennonite bodies in the United States and has 176 ministers, 91 churches, and about 11,000 communicants, being most largely represented in Illinois, Pennsylvania, and Ohio. A settlement of Amish Mennonites was formed in 1824 in Wilmet Township, Ontario, where land was bought for the purpose by Christian Nafziger, of Munich.

IV. The **Old Amish Mennonite church** is the result of a separation from the Amish body which took place about 1865 over questions concerning forms of worship and methods of Church work, the separatists protesting against certain steps which they regarded as innovations, and insisting upon a strict adherence to the ancient forms and practices. They have about 2000 members, with 74 ministers and 25 churches, and are strongest in Indiana and Ohio.

V. The **Apostolic Mennonite church** is a branch derived from the Amish, which came to the United States by immigration from Europe about 1840. The discipline is less strict than in the other Amish branches. Fourteen churches are included, with 34 ministers and about 900 members.

VI. The **Reformed Mennonite church** originated in 1812, under the leadership of John Herr, who protested against laxity in the Mennonite church and insisted upon the preservation of purity in teaching and the maintenance of exact discipline. Its adherents are strict in the observance of the old ways and in their discipline, and do not as a rule hold fellowship with other denominations. They have about 1000 members, about half of them being in Pennsylvania, with 32 ministers and 32 churches.

VII. The **General Conference Mennonite church** has adopted modern views and practices to a larger extent than most of the other branches. It originated as a result of proceedings which were instituted in 1848 in Pennsylvania against a minister, John Oberholtzer, who was charged with attempting to introduce new teachings and practices. Oberholtzer and his sympathizers withdrew and formed a body called the New Mennonites. This body united with churches whose members had come from Germany and settled in Illinois and Iowa, and a General Conference was formed with three districts—eastern, central, and western. A new constitution, described as being evangelical in tone, was adopted in 1898. A publishing house is maintained at Berne, Ind., and several periodicals, in German and English, are issued. The number of members is about 13,000, with 172 ministers and 112 churches.

VIII. The **Church of God in Christ** was founded in 1859, under the leading of John Haldeman, who believed himself inspired with the spirit of prophecy. It inculcates a strict adherence to the teachings of the founders of the Mennonite church. The estimate of its numbers gives it 11 ministers, 9 churches, and 300 members.

IX. The **Old, or Wisler, Mennonites** represent a separation from the Mennonite church in Indiana which took place about 1870 by those who opposed the introduction of Sunday schools, evening meetings, and other new features. The first conference of this division was held in 1898.

They number about 1200 members, with 20 ministers and 12 churches.

X. Die Bundes Konferenz der Mennoniten Brüdergemeinde originated in Russia about 1840, and was brought to the United States by immigrant adherents between 1873 and 1876. It practices baptism by immersion and attaches special importance to evidences of conversion. It is one of the most active of the Mennonite bodies in missionary enterprise and has missionaries in China, Africa, and India. Its 27 churches have 2700 members and 46 ministers.

XI. The Defenseless Mennonites are likewise distinguished by the stress they lay upon the necessity of conversion and regeneration, and represent a separation from the Amish, which was led by Henry Egli. They have about 735 members in 10 churches, with 16 ministers.

XII. The Church of the Mennonite Brethren in Christ is the most recent in organization of the Mennonite bodies, having been formed about 1880. The Brethren are open communions and administer baptism in any of the usual forms. They have 97 churches, 149 ministers, and about 5000 members in the United States and in Canada.

The larger Mennonite branches have in recent years displayed increased activity in missionary enterprise, in consequence of which they have enjoyed a greater relative prosperity. A general tendency has been observed towards a closer drawing together of the different branches. This was exemplified in an effort which was made in 1898 to secure the holding of a General Conference of the Mennonite and Amish district conferences, and in the coöperation of all the bodies with the Home and Foreign Relief Commission at Elkhart, for famine relief in India, for the education of the famine orphans, and for the support of the missionaries among them.

The *Gospel Banner*, weekly, and the *Evangeliums Panier*, semimonthly (Berlin, Ontario), represent the Mennonite Brethren in Christ.

MEN'NO SIMONS (1492-1559). The

founder of the later school of Anabaptists (q.v.) in Holland, from whom the Mennonites (q.v.) take their name. He was born at Witmarsum in Friesland in 1492; took orders in 1516; and was a priest in his native place from 1531 to 1536. The study of the New Testament, however, excited grave doubt in his mind regarding the truth both of the doctrine and constitution of the Church, and in 1536 he withdrew from it altogether. He attached himself to the party of the Anabaptists, was rebaptized at Leeuwarden, and in 1537 was appointed a teacher and bishop in the university of what was then known as the Old Evangelical or Waldensian church at Groningen. Henceforth his great endeavor was to organize and unite the scattered members of the Anabaptist sect in Holland and Germany. With this design he spent much time in traveling; but Friesland was his chief residence until persecution compelled him to flee. Finally he settled in Oldesloe in Holstein, where he was allowed to establish a printing press for the diffusion of his religious opinions. Here he died, Jan. 13, 1559. He was a man of earnest and spiritual nature, with no trace about him of the wild fanaticism of the earlier Anabaptists. His book of doctrine, *Elements of the True Christian Faith*, was published in Dutch in 1539. His works in English translation are published by the Mennonite Publishing Society at Elkhart, Ind. Consult his *Life* published in Dutch by F. C. Fleischer (1892); also, R. Barclay, *Inner Life of Religious Societies of the Commonwealth* (London, 1877).

MEN'OBAN'CHUS. A genus of large newts, of the family Proteidae, represented in the United States only by the mud puppy (q.v.).

MENOCAL, mā'nō-kāl', MARIO GARCÍA (1867-). A president of Cuba. He was educated at Cornell University as a civil engineer, which profession he followed most of his life. During the war against Spain (1895-98) he served in the Patriot army with some distinction, but upon the conclusion of peace returned to his profession and was the managing director of the Cuban American Sugar Company, in charge of one of its large estates in Cuba. In 1912 he was elected president on the Conservative ticket, chiefly on the ground of the administrative ability which he had shown in business. His policy was to endeavor to cement better relations with the United States, to introduce economy in the administration, and to secure financial reforms for the country. He labored to give Cuba a clean, stable, and economical government, but experienced considerable opposition and criticism of his policy.

MENOMINEE, mē-nōm'ī-nē, or **MENOMINI** (wild-rice men, so called because of their great use of the wild rice which grows abundantly in their country). A considerable Algonquian tribe, formerly ranging over northern Wisconsin and the adjacent upper Michigan, chiefly along the river of the same name, and now gathered upon a reservation near Green Bay, Wis. In their general characteristics they resemble the Ojibwa, but they speak a distinct language. French missionaries established a mission among them in 1670, and they remained faithful to the French interest until the end. They aided the English in the Revolution and in the War of 1812 and fought under Tecumseh during the latter struggle. In 1910 they numbered 1422. Consult W. J. Hoffman, "The Menomini," in *Bureau of American Ethnology, Fourteenth Annual Report*

(Washington, 1896), and Alanson Skinner, "Social Life and Ceremonial Bundles of the Menomini Indians," in *American Museum of American History, Anthropological Papers*, vol. xiii (New York, 1913).

MENOMINEE. A city and the county seat of Menominee Co., Mich., 165 miles north of Milwaukee, Wis., and opposite Marinette, Wis., with which it is connected by three bridges. It is situated on Green Bay, at the mouth of the Menominee River, and on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Wisconsin and Michigan railroads (Map: Michigan, B 3). It is also the western terminus of the car ferries of the Ann Arbor Railroad. One of the greatest lumber-shipping ports in the State, Menominee has numerous saw and planing mills and a great variety of manufactures, including electrical appliances, telephones, shoes, paper, steam boilers, heavy machinery, boxes, beet sugar, automobile trucks, baby carriages, canned goods, packing-house products, etc. The city is the seat of Menominee County Agricultural College and contains a public library and museum, several fine schools, well-kept parks, and a public hospital. Menominee, first incorporated in 1883, is governed under a charter of 1905, which provides for a mayor, chosen biennially, and a unicameral council which elects most of the administrative officials, only the supervisor, city treasurer, and justice of the peace being chosen by popular election. Louis Chappieu, a trader, settled here in 1799; but the city really dates from 1883, when the first mill was built here. Pop., 1900, 12,818; 1910, 10,507.

MENOMONIE. A city and the county seat of Dunn Co., Wis., 69 miles by rail east of St. Paul, Minn., on the Red Cedar River and on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, B 4). It has a fine memorial library, the Stout Institute, a county normal school, and a county agricultural school. The Dunn County Asylum is near the city. Other noteworthy features are the courthouse, city hall, Federal building, and Lake Menomin. The industrial interests are represented by brickyards, foundries, and machine shops, carriage and wagon works, and manufactories of gasoline engines, cigars, dairy products, pianos, flour, etc.; and the commercial interests by a large trade in brick, live stock, flour, wheat, and fur. The city was formerly an important manufacturing and distributing centre for lumber. Menomonie adopted the commission form of government in 1912. Pop., 1900, 5655; 1910, 5036.

MEN'OPAUSE. See MENSTRUATION.

MEN'OPOME. The hellbender (q.v.).

MENORRHAZIA. See MENSTRUATION.

MENOU, me-nōō', CHARLES DE. See CHABRISE, SEIGNEUR DAULNAY DE.

MENPES, mēn'pēs, MORTIMER (1859-). An English painter, etcher, and draftsman. He was born at Adelaide, South Australia, was educated at Port Adelaide, and at 19 went to London. There he studied at South Kensington, and then went to Pont Aven in Brittany, where he remained three years. Yet he was largely self-taught in art. In 1900 he was artist for *Black and White* in the South African War. Of extraordinary versatility, he held more exhibitions in London than any contemporaneous artist. He traveled in many lands, including Japan, India, Mexico, Spain, Morocco, and Brittany, every-

where painting in oil and water color and drawing and etching scenes and objects of interest or beauty. His work shows a refined sense of color, and power and delicacy of draftsmanship. In his Japanese studies he invented a process of painting in water color by which he attained uncommon brilliancy of effect, and he also revived the art of printing in color from etched plates. In later years he turned his attention to portraiture on a small scale, where his mastery of many mediums and skill as a draftsman are effectively shown. He was elected a fellow of the Royal Geographical Society and in 1885 became a member of the Society of British Artists. He published, among other works: *World Pictures* (1902); *Whistler as I Knew him* (1904); *Rembrandt* (1905); *India* (1905), with Mrs. F. A. Steel; *Sir Henry Irving* (1906).

MENSES, mēn'sēz. See MENSTRUATION.

MENSHIKOV, mēn'shī-kōf, ALEXANDER DANILOVITCH (1673-1729). A Russian field marshal and Minister of State. He was born near Moscow in 1673, in humble circumstances. His intelligent countenance attracted the notice of General Lefort, through whose patronage he was taken into the service of Peter the Great. He accompanied Peter in his travels to Holland and England, and on the death of Lefort became the Czar's chief adviser. Menshikov showed equal ability as a general and as a diplomatist, and although totally uneducated he did much to promote the education of the people and was a liberal patron of the arts and sciences. In 1702 he distinguished himself in the siege of Notenburg and was made commander of this fortress after it was taken by the Russians and renamed Schlis-selbourg. During the same year Menshikov took Marienburg; among the prisoners taken on this occasion was the girl Katherine Skavronsky, who later became the wife of Peter the Great and the Empress of Russia. In 1703 he was appointed Governor of Ingermanland, Coreles, and Eastland. On Oct. 30, 1706, he defeated the Swedes at Kalisz. He contributed to some of the Czar's other victories, was made a field marshal on the field of Poltava, 1709, and after the battle compelled Lewenhaupt to capitulate with a great part of the Swedish army. In 1710 he took Riga, in 1712 he led the Russian troops into Pomerania and Holstein, and in 1713 took Stettin, but gave it up to Prussia contrary to the will of the Czar. This and his avarice so displeased Peter that Menshikov was court-martialed and condemned to death, but he was pardoned on payment of a heavy fine. During the reign of Catharine I he regained his influence at court, and after her death governed Russia with almost absolute authority in the name of Peter II. His daughter was about to marry the young Czar when Menshikov lost his influence and was banished to Siberia, September, 1727. His estates and treasures were confiscated. He died Nov. 12, 1729.

MENSHIKOV, or **MENTCHIKOV,** ALEXANDER SERGEEVICH, PRINCE (1787-1869). A Russian statesman and general, the great-grandson of Alexander Danilovich Menshikov. He participated in the campaigns of 1812 to 1815 against Napoleon. In 1820 he was appointed commander of the Black Sea fleet, but he resigned four years later because of insufficient acquaintance with naval matters. During the Russo-Turkish War of 1828-29 he took Anapa and was wounded at Varni. In 1831 he was made Governor-General of Finland. In 1836

he became Minister of Marine and did much to increase the effectiveness of the Russian navy. In 1853 he was sent as Envoy Extraordinary to Constantinople just before the rupture which resulted in the Crimean War, but he was not, as is frequently stated, responsible for the rupture. During this war he became prominent as defender of Sebastopol, where he showed the greatest energy until his retirement on account of ill health in March, 1855. He died at St. Petersburg.

MENSTRUATION. The periodic discharge of sanguineous fluid which issues from the generative organs of the human female during the period in which she is capable of procreation.

The first appearance of this discharge, to which are applied the terms menses and catamenia, indicates the approach of sexual maturity, and is accompanied by enlargement of the mammary glands, a growth of the external genitals, an increase of hair upon the *mons Veneris*, and an accession of reserve, thoughtfulness, and maturity. Menstruation usually commences between the fourteenth and the sixteenth years and terminates between the fortieth and fiftieth years. The cessation of the menstrual flow is called the menopause. The interval between successive menstrual periods is about four weeks, although it is oftener shorter; and the duration of the flow is usually three or four days, but is liable to great variations even in health. The first appearance of the discharge is usually preceded and accompanied by pain in the loins and headache, malaise, depression, and restlessness, and in many women these symptoms invariably accompany the discharge. As a general rule there is no menstrual flow during pregnancy and lactation, and its cessation is one of the first signs that conception has taken place. In robust young girls who have lived an outdoor life there is no disturbance experienced at the appearance of the menses. In many others, however, there is considerable nervous excitement, consisting of irritability, emotion, depression, flushing, and throbbing of the head.

Difficult and painful menstruation is called dysmenorrhœa. During such nervous manifestations the girl should be treated as an invalid, and studies should not be persistently prosecuted. Avoidance of drains upon physical and mental powers should be enjoined, and abundant daily outdoor life should be secured. Other disorders of the menstrual function are amenorrhœa (q.v.), or lack of flow, and menorrhagia, or metrorrhagia, excessive flow. The latter is generally a sign of serious disease of the uterus or its appendages and demands prompt medical attention.

MENSURABLE MUSIC (Lat. *mensurabilis*, measurable, from *mensura*, measure). Strictly speaking, all music written in notes that have

a definite time value. In a specific sense the term is applied to the music written between the beginning of the twelfth and the seventeenth centuries, before the invention of the line dividing a composition into bars. Before the twelfth century the choral note of the plain chant indicated only the pitch. The duration of each note was left to the individual singer and arbitrarily determined by the rhythm of the text. As long as music was sung in unison this system answered all practical purposes. But with the introduction of harmony and the development of polyphonic music, employing a number of independent voices, an imperative need made itself felt to fix the duration of the individual note. Mensurable music, therefore, borrowed the forms of the notes as used in the plain chant. These were: the large (*maxima* or *duplex longa*), ; the long (*longa*), ; the breve (*brevis*), ; and the semibreve (*semibrevis*), . To these were added the minim (*minima*), , and semi-

minim (*semiminima*), . For nearly 300 years the notes were written in this form. At the beginning of the fifteenth century the black notes were gradually supplanted by the white or open notes: , , , . For the smaller notes both the black and white forms

continued in use: semiminim,  or ; croma or

fusa,  or ; semicroma or semifusa,  or . Even as early as the sixteenth century rounded notes were substituted for the square ones in writing music. But it was not until 1700 that the round forms were generally adopted by music printers.

Out of reverence for the Trinity triple time was regarded as *perfect* time, whereas duple time was *imperfect*. A division of a note into three of the next smaller kind was *mensura perfecta*; into two of the smaller kind, *mensura imperfecta*. This division was indicated by certain signs, but a sharp distinction was made between the division of a long into breves, or of a breve into semibreves. These signs were placed at the beginning of a composition. The division of a large into longs or of a long into breves was known as *modus*; of a breve into semibreves as *tempus*; of a semibreve into minims as *prolatio*. The *modus* itself was further distinguished as *modus major* (division of a large into longs) and *modus minor* (division of a long into breves). A still further subdivision of both the *modus major* and *minor* was into *perfectus* (triple time) and *imperfectus* (duple). *Tempus* was thus also subdivided into *perfectum* and *imperfectum*; whereas in the case of *prolatio* this division was designated as *major* and *minor*. The following table gives a complete view of this system with the various signatures:

Modus major perfectus	1  = 3  , } 
Modus major imperfectus	1  = 2  , } 
Modus minor perfectus	1  = 3  , ,
Modus minor imperfectus	1  = 2  , ,
Tempus perfectum	1  = 3  , ○
Tempus imperfectum	1  = 2  , C
Prolatio major	1  = 3  , • within tempus sign.
Prolatio minor	1  = 2  , no dot.

The sign of the *modus major* was the same for the *perfectus* and *imperfectus*. The following sign for the *modus minor* determined the *modus major*. If the sign  was followed by  or , it was *modus major perfectus*; if followed by  or , it was *modus major imperfectus*. The length of the vertical bars had reference to the *modus minor*, the long bars indicating the *perfectus*, the short ones the *imperfectus*. The number of vertical bars referred to the division of the large into two or three longs. The *prolatio* sign appeared only in connection with the *tempus* sign. Thus  meant *tempus perfectum*, *prolatio major*;  *tempus imperfectum*, *prolatio minor*. If the *tempus* sign appeared without a dot it always meant that *prolatio minor* was understood. The following table will make this clear:

			Modus major perfectus. Modus minor perfectus. Tempus perfectum. Prolatio major.
			Modus major perfectus. Modus minor imperfectus. Tempus perfectum. Prolatio minor.

The time value of the different notes as fixed by these signs or signatures was known as the *integer valor notarum*. But these fundamental values could be changed by means of *augmentatio*, *diminutio*, and *proportio*. *Diminutio* reduced the value of the notes in triple time to one-third, in duple time to one-half of the original value. It was indicated by a vertical line through the signature, , or by affixing a number to the *tempus* sign,  2 or  3. Time indicated thus always denoted a lively tempo, corresponding to the modern *allegro*. *Augmentatio* signified the restoration of the *integer valor* of notes reduced by *diminutio*. It was indicated by writing the ordinary sign of the *integer valor*,  . A change of the *integer valor* by means of fractions was known as *proportio*. Thus $\frac{3}{2}$ meant that the time was to be accelerated, so that three breves now had the same duration as one breve of *integer valor*. But $\frac{2}{3}$ meant the opposite, viz., that the time was to be retarded, so that one breve now had the same duration as three breves of the *integer valor*. A special kind of *proportio* was that indicated by $\frac{3}{2}$, known as *hemiola*.

Alteratio was the doubling of the time value of the second of two notes of the same kind when a tripartite note of the next larger kind followed. Generally the two smaller notes stood between two of the larger kind, or were separated from the following notes of equal or smaller value by a *punctum divisionis*. Thus, in *tempus perfectum* (, tripartite),    would be expressed in modern notation (values reduced one-half) .   .

An important factor in the theory of mensurable music was the *color* of the notes. The ordinary note was black. In the fourteenth century a red note (*notula rubra*) was used. Originally this red note was used instead of signatures to denote a change from *perfectio* to *imperfectio*, or vice versa. Soon it was definitely used to indicate *imperfectio* only. For want of red color it was often left open or white (*notula alba*), and during the fifteenth century the white note had the same meaning as the red note of the fourteenth. When finally the white notes

were generally adopted (during the sixteenth and seventeenth centuries), *imperfectio* was denoted by the black note (*notula nigra*).

A group of two or more notes to be sung on one syllable was called *ligatura*. When only two notes were given to one syllable, they were written as one and called *figura obliqua*.

In ligatures of more than two notes the time value of the individual notes was not determined from their actual shape but from their position. The value of the first note could be a breve or a long. In the former case the term *proprietas*, in the latter *improprietas*, was applied. If the second note was lower than the first, *proprietas* was indicated by a vertical line

			Modus major imperfectus. Modus minor perfectus. Tempus imperfectum. Prolatio major.
			Modus major imperfectus. Modus minor imperfectus. Tempus imperfectum. Prolatio minor.

(*cauda*) downward on the left side of the first note, ; if the second note was higher, the

cauda was wanting, . In both cases the first note is breve. *Improprietas* was indicated by adding the *cauda* to the first note if the second was higher, and omitting it if the second

was lower,  . Here both first notes are longs.

Out of this system of notation our modern system of notation has been gradually evolved. Consult: H. Müller, *Eine Abhandlung über Mensuralmusik* (Leipzig, 1886); J. Wolf, *Geschichte der Mensuralnotation von 1250-1460* (ib., 1904); H. Bellermann, *Die Mensuralnoten und Taktzeichen des 15. und 16. Jahrhunderts* (Berlin, 1906); H. Riemann, *Kompendium der Notenschriftkunde* (Ratisbon, 1910); J. Wolf, *Handbuch der Notationskunde* (Leipzig, 1913).

MENSURATION (Lat. *mensuratio*, from *mensurare*, to measure, from *mensura*, measure, from *metiri*, to measure). A branch of applied mathematics dealing with the calculation of lines, angles, surfaces, and volumes from measured data. The metrical relations between lines and angles are computed chiefly by the principles of trigonometry (q.v.). The mensuration of common surfaces and volumes, however, can generally be effected by the principles of geometry. For the purposes of either direct measurement or computation a unit is necessary. The straight line is measured by direct comparisons with some linear unit, as the inch, foot, yard, or meter. But in measuring a surface or volume it is unnecessary to apply an actual square or cubic unit, or even to divide the magnitudes into such squares or cubes. It is only necessary to measure certain of its boundary lines or *dimensions* and from these measurements to calculate the contents in terms of the appropriate unit, e.g., if *a* inches and *b* inches are the lengths of the adjacent sides of a rectangle, its area is *a* · *b* : 1 square inch = *ab* square inches; i.e., the number of square units of area in a rectangle is equal to the product of two numbers which rep-

resent its base and altitude, measured by the same linear unit. The areas of other figures are found from this area by the aid of certain relations or properties of those figures; e.g., the area of a parallelogram is the same as the area of a rectangle having the same base and altitude, and is therefore equal to the base multiplied by the altitude. As a triangle is half of a parallelogram of the same base and the same altitude, its area is one-half the product of its base and altitude. Certain quadrilaterals and polygons are measured by dividing them into triangles, the area of each of which is separately calculated. (For the area of the circle, see CIRCLE.) By reasoning similar to that employed in the case of areas, it is shown that the volume of a rectangular parallelepiped or prism is found by multiplying together the length, breadth, and thickness; and of the oblique parallelepiped, prism, or cylinder, by multiplying the area of the base by the height.

As in case of the circle, so in the mensuration of the cylinder, cone, and sphere, the theory of limits (see LIMITS, THEORY OF) is applied in connection with the circumscribed and inscribed figures. The following formulas of mensuration will be found convenient:

Abbreviations: b , base; h , altitude; r , radius; a , area; c , circumference; p , perimeter; s , slant height; v , volume; m , mid section; a , the number of radians in an angle.

Parallelogram.....	$a = bh$.
Triangle.....	$a = \frac{1}{2}bh$.
Trapezoid.....	$a = \frac{1}{2}(b + b')h$.
Parallelepiped.....	$v = bh$.
Prism.....	$v = bh$.
Lateral area, right prism.....	$a = ph$.
Prismatoid.....	$v = \frac{1}{6}h(b + b' + 4m)$.
Pyramid.....	$v = \frac{1}{3}bh$.
Lateral area, regular pyramid.....	$a = \frac{1}{2}ps$.
Frustum of pyramid.....	$v = \frac{1}{8}h(b + b' + \sqrt{bb'})$.
Lateral area, frustum of regular pyramid.....	$a = \frac{1}{2}(p + p')s$.
Right circular cylinder.....	$v = bh = \pi r^2 h$.
Lateral area.....	$a = ch = 2\pi rh$.
Right circular cone.....	$v = \frac{1}{3}bh = \frac{1}{3}\pi r^2 h$.
Lateral area.....	$a = \frac{1}{2}cs = \pi rs$.
Frustum of right circular cone.....	$v = \frac{1}{3}\pi h(r_1^2 + r_2^2 + r_1 r_2)$.
Sphere.....	$v = \frac{4}{3}\pi r^3$, $a = 4\pi r^2$.
Lune.....	$a = 2ar^2$.
Spherical polygon.....	$a = ar^2$.
Zone.....	$a = 2\pi rh$.
Spherical segment.....	$v = \frac{1}{6}\pi h[3(r_1^2 + r_2^2) + h^2]$.
Spherical sector.....	$v = \frac{2}{3}\pi r^2 h = \frac{1}{3}\pi br$.
Circle.....	$c = 2\pi r$, $a = \pi r^2$, $\text{arc} = a \cdot r$.

For the mensuration of geometric solids, consult Holzmüller, *Elemente der Stereometrie* (2 vols., Leipzig, 1900).

MENT. See MONT.

MENTAL CONSTITUTION. A somewhat popular term, used with a meaning analogous to "bodily constitution," "physical constitution," and the like, to denote the general make-up of individual minds. Language is rich in words for individual differences of ability, temperament, character, and general organization. For example, men are able or inefficient, talented or stupid, sympathetic or cold, emotional or phlegmatic, rash or cautious, steady or unreliable; they are weak-willed and strong-willed, broad-minded and narrow-minded, slow and quick. Differences of this kind, manifested in learning, acting, thinking, are referred to, loosely, as differences in mental constitution. Their analysis and classification are undertaken by individual psychology. (See INDIVIDUAL PSYCHOLOGY; MENTAL TESTS.) They are to be explained in terms of inherited and acquired tendencies or predispositions in the nervous system. See DETERMINING TENDENCY; DISPOSITION; HABIT.

MENTAL DEFECTIVES. Definition. The mentally deficient person is one who by reason

of anatomical or pathological conditions occurring in the brain at or before birth is unable to compete successfully with his normal fellows in play, study, or work. Though an adult, he cannot gain a livelihood independently, but requires guidance and some one to take the initiative and assume responsibility. These persons are spoken of as *aments*, i.e., without mind, as distinguished from *dements*, who had minds but lost them.

Classification. A person having almost a normal mind, but not knowing more than a child of 12 years, is called a *moron*, from the Greek *μωρός*, a "fool"; one having the mind of a child of seven to 12 years is *feeble-minded*; one with the mentality of three to seven years is an *imbecile*; and the individual who remains at the state of development of two years is an *idiot*.

A normal child at two years of age will repeat rhymes, distinguish colors, obey simple commands, and imitate the acts of others. At seven years of age a child will count up to 20, knows the names of coins in common use, can tell time correctly, and can make readable copy of simple sentences. At 12 years of age the child can construct sentences containing three given words, can give rhymes rapidly to sug-

gested words, and can define such words as "charity," "justice," and "goodness." The moron is likely to be nearly normal in feature, in expression, and in physical development. The defectiveness may not appear until it is found that he does not keep to a piece of work or study, or does not show normal resistance to unwise advice or immoral example. Such persons have little power of inhibition, but are like an engine without a balance wheel or governor. They are very subject to their environment. This is the group that becomes a large factor in the problems of criminality, truancy, pauperism, and prostitution. The feeble-minded person does not easily pass for normal; he is likely to be under normal size, have a head of peculiar shape, e.g., boat-shaped (scaphoid), or very round like a turned post, or high like a tower (oxycephalic). There is frequently asymmetry of the skull and face. The eyes may be of different colors and strabismus or other errors of action exist. The ears are often large and of unequal size, and may exhibit a Darwinian tubercle suggesting a lower animal. The palate is in many cases very high, easily earning the name "Gothic arch."

The imbecile is still farther from normal in appearance. He has little activity of the senses

and accordingly is without facial expression; the muscles of his face, like the others of his body, are flabby and without tone. His palate may be high and his teeth very irregular and subject to early decay. A normal head is 22 inches in circumference, but that of the imbecile, besides being very asymmetrical, may be microcephalic, very small; or hydrocephalic, very large; the imbecile is careless about his clothing, though he may be able to put it on.

The idiot is the lowest of the group. He may have no more stigmata than the imbecile, but is usually a more helpless-looking object. He is likely to be paralyzed and is often an epileptic. His mentality is so meagre that he cannot protect himself from harm and injury. His "mind is a negation." He must be clothed and fed by others, often requiring as much attention as an infant.

To this general classification must be added three other varieties: the *cretin*, *Mongolian idiot*, and the *amaurotic family idiot*. The cretin is a short, thickset little individual 3 or 4 feet high, having heavy features, broad nose, thick lips and tongue, thick, dry skin, and coarse, wiry hair. Upon the shoulders above the collar bone are pads of fat. The limbs and so-called long bones are very short. The hands are short and pudgy. The development of puberty is delayed, if indeed he reach that stage at all. Cretins are usually happy folks and capable of some instruction. The cause in these cases has been traced to absence of the thyroid gland, leading to perverted metabolism. The trouble may be overcome by administering thyroid-gland extract by mouth.

The Mongolian idiot is so called because he has an Oriental cast of countenance, due to obliquity of the eye slit. The eyes seem to be a bit on the bias. There is no asymmetry of the skull, but a round head with regular features. An idiot of this sort is usually the last born in a family and the only one mentally defective. As is well known, there are many families in which all the members are defective, but they belong to the feeble-minded or imbecile groups.

The amaurotic idiot is blind from degeneration of the optic nerve. Amaurosis in Latin and Greek means "to darken." Examination with the ophthalmoscope reveals a cherry-red spot in the fovea centralis of the macula lutea, which has now become not a yellow spot, but a white spot. The cherry spot is pathognomonic of this disease. There is a gradual lessening of strength until the child can no longer sit up and soon becomes wholly paralyzed. This is due to degeneration of the ganglion cells throughout the gray matter of the brain and cord. The disease is first discovered by the parents at about six months of age and progresses to a fatal termination in about a year. It is a singular fact that all cases reported thus far have been of Jewish parentage. Frequently there are two or more affected in the same family. There is neither cure nor likelihood of betterment.

Prevalence. Data collected in studying 10,000 school children in California, the same number in New Jersey and in Philadelphia, showed about 3 per cent to be feeble-minded. The British Royal Commission, in a study of a population of 3,873,151, found aments at the rate of 3.28 per thousand, i.e., one mental defective to 248 persons. Four aments per thousand is a very conservative estimate and will

enable one to calculate the number in any community at any time. For example, in 1915 the United States population of 100,000,000 would contain 400,000 mental defectives. It is interesting to note that the insane, i.e., those who had minds and lost them, aggregate the same as the mentally deficient. Fifty per cent of the youths in reformatories are mentally defective, and 25 to 50 per cent of adult prisoners are the same. The Commission for the Investigation of the White Slave Traffic, so called, found more than half the number of prostitutes feeble-minded. Truants and paupers are largely feeble-minded, 80 per cent and 50 per cent respectively.

Cause. Mental deficiency is attributed to heredity, accidents at birth or in early life; to diseases such as meningitis, convulsions, and fevers; to traumatism; to the fact that the parents were alcoholic, tuberculous, syphilitic, or neurotic. Many of these conditions are concomitant, but proofs of cause and effect are wanting. There are multitudes of alcoholic parents without feeble-minded children; 66 per cent of the defectives come from alcoholic families most of which are physically and financially poor. Goddard studied thoroughly the family history of 300 cases and found that 54 per cent of them were undoubtedly hereditary. His studies showed many interesting alleged causes, and only 2.6 per cent unaccounted for. In former years only 25 per cent of patients having cerebrospinal meningitis recovered, and of these 97 per cent were mentally defective. Now that we have the serum treatment for meningitis this factor should be eliminated. Atwood found that 20 per cent of 200 defectives gave a positive Wassermann reaction, yet syphilis cannot be claimed as the sole cause of their condition.

Mendelian laws hold good in the heredity of man as elsewhere in nature, and according to Goddard the real cause of mental defect "is bad protoplasm." Tredgold holds that "primary amentia is a manifestation of a pathological germinal variation which has been produced by environment, and that the germinal change is of the nature of a vitiation." Consanguinity is not a causative factor in healthy families, nor in others unless they be neurotic. The hereditary character of the condition is recognized by individual students everywhere and also by the British Royal Commission as a body. The lawmakers and public officers of most countries have in recent years been giving careful consideration to the treatment of these unfortunate persons.

Segregation. All mentally defective children should be placed out of the family while young; first, because they cannot associate on equal terms with the normal members; secondly, because they require expert teaching and oversight to improve their condition. This may be done by the wealthy in private training schools, and should be insisted upon for others in public institutions. Only 24 States of the United States (1914) have institutions fit for the care of the mentally deficient. Although there are 30 such places, they can accommodate only 19,000 persons. Older persons should be in institutions in order that they may be under responsible direction and enabled to take part in useful work—at all events to be safe from bad moral influences and temptations if they be of high-grade mentality. It is the high-grade defectives that are a menace to society, especially the females, who so readily become mothers. At the New

York State Reformatory for Women a study was made of 2000 prostitutes, with the result that 29 per cent were decided to be subnormal. New York State also has an institution especially for women during the child-bearing age.

In connection with this phase of the subject there has been much discussion regarding asexualization. While all students are in favor of segregation, accommodations do not exist for one in twenty of those who need it. Sterilization as now performed is simply vasectomy in the male and ligation of the Fallopian tubes in the female. There being no removal of the glands peculiar to either sex, the individual retains general characteristics but loses the power to reproduce. Laws have been passed in several States legalizing the operation, but it has not become a popular procedure. Some idea of the expense to the public of feeble-minded families may be had by reading *The Jukes*, by Dugdale, or *The Kallikak Family*, by Goddard. The cost to the State for the care of criminals, paupers, and incompetent persons because of mental deficiency is counted literally in millions of dollars.

Instruction. Various attempts have been made to teach idiots, one of the earliest being that of Itard's wild boy found in the forest of Aveyron in 1799. The boy's ignorance was largely due to deprivation, so that some slight success was attained in the attempt to improve his condition. One of Itard's pupils was Edouard Seguin. In 1837 Seguin began to instruct idiots in the Hospital for Incurables in Paris. He regarded the idiot as an undeveloped infant and, proceeding upon a definite plan, instituted a course of physiological education. He insisted upon the value of food, air, and exercise, i.e., the need of a healthy body for a useful mind, and began then to train the senses. He visited America several times and made his home here from 1863, when he established in New York the Seguin Physiological School for Feeble-Minded Children. Before the Academy of Sciences in Paris it was declared that Seguin had solved the problem of the education of idiots. Not only are there special institutions, public and private, for the defectives, but special classes are formed in connection with the schools of most large cities. Such classes existed in Halle about 1863 and in Dresden in 1867. New York City had in 1914 200 ungraded classes with 3100 children.

In teaching the mentally defective, the games and exercises are designed especially to fix the attention and promote coördination. Music appeals to the feeble mind, and the children learn to march and play to the accompaniment of piano, or other instrument. Reading, writing, and number work may be learned by the higher grade pupils, yet they always show a certain amount of childishness in composition. The exact degree of intelligence is standardized by various methods, notably the Binet test. (See MENTAL TESTS.) The boys are taught mat-making, weaving, basket making, shoe mending, tinsmithing, carpentering, gardening, and farming. The girls are taught the care of the house or wards, sweeping, dusting, making beds, setting table, and being useful in the kitchen. They learn to sew and do fancywork, the fineness of which depends upon their mentality. Farm colonies are operated by several States with great benefit to the inmates, both in body and mind. A feeble-minded person rarely grows much beyond the mental age that he stands the test for;

therefore he should be given all the training possible in order that he may not drift below his station.

Treatment. There is no remedy for the majority. Cretins may be practically cured if the condition is recognized before they are six months of age and thyroid extract is given systematically. In 1890 and the following years craniectomy was practiced extensively in the hope that removing strips of bone would allow the brain more room for growth. The procedure was a failure. Drainage of hydrocephalus by either the external or the internal method has not helped conspicuously. The mentally defective may have diseases of the body which indirectly impair their minds. Such must be treated, especially if the infirmity is of the nervous system.

Results. The investigation of Dr. Caldecot indicates the result of training in 341 patients discharged from the institution because they were supposed to be suited to life outside. The time covered was 15 years. He says "3.25 per cent were earning wages, 3.81 per cent were at home very useful. 7.5 per cent were at home and useful, and the rest, i.e., 85.5 per cent, were no good and should have been taken care of for life."

MENTALITY OF INSECTS. See section on *Social Insects* under INSECT; also INSTINCT.

MENTAL PATHOLOGY. The science of abnormal mental process. The intimate dependence of consciousness upon the functioning of the central nervous system enables us to approach the investigation of morbid mental conditions from the vantage ground of physiology. The brain, which is the substrate of mind, may, like any other organ of the body, exhibit (1) defects, i.e., lack of some structure, or (2) abnormality of function, whether it be (a) temporary, i.e., a disorder, or (b) permanent, i.e., a disease. "Defectives" are, then, persons who suffer, congenitally or from early childhood, from the absence of some group or groups of mental elements in consequence of some underlying defect of the nervous system; they are the blind, the deaf, the paralytic, etc. The cases of Laura Bridgman and Helen Keller, the blind deaf-mutes, are typical. From careful reports of their educational progress and from special psychological and neurological examination of their mental and physiological organization valuable data have been secured. Temporary mental derangements are found in the consciousness of dreams, hypnosis, and the intoxication of various drugs. Frequent attempts have been made to examine mind as specific phases of it are rendered anæsthetic or hyperæsthetic in these ways. Hashish (extract of *Cannabis indica*), e.g., greatly mag-

nifies our consciousness of duration and extent, and also induces visual hallucination. Chronic mental derangement is exemplified by the various forms of insanity, such as mania, melancholia, dementia, general paresis, etc.

Abnormal mental types are, as one writer puts it, "psychological experiments made for us by Nature herself." Especially is this true when the infirmity is isolated, when a single group of mental processes—e.g., a sense department—is either entirely lacking or extraordinarily emphasized. Such a state of affairs simplifies matters for the psychologist. He is able to find out the relative value of the group concerned in the normally organized mind, and, as a consequence, to proceed more successfully with the analysis of the adult human consciousness. (See PSYCHOLOGY.) Take, e.g., cases of the anæsthesia of particular internal organs which lie beyond that experimental control which is of supreme importance in the laboratory investigation of the external sense organs. Evidence of this sort has been of weight in referring the sensation of dizziness to the semicircular canals of the internal ear. (See STATIC SENSE.) From observations of senile dementia Hughlings Jackson has established the law that, in the gradual loss of memory with advancing age, the latest mental stuff, that acquired with most difficulty, first decays. The successive stages of dissolution, consequent upon the inroads of cerebral deterioration, retrace the steps of evolution. The various types of aphasia (q.v.) have been of great assistance in the solution of the problem of the cortical localization of function, as well as in the more strictly psychological problems of apperception (q.v.) and language. There are, in particular, two lines of recent work which appeal to the interest of students both of normal and of abnormal mental processes. The rapid development of mental tests (q.v.) and their application to the retarded and feeble-minded as well as to the mentally sound have led to discussion and co-operation and have raised important issues of psychophysical heredity; and the Freudian school, whose doctrines are based upon a fairly definite psychological system and whose specific method is that of psychoanalysis, has brought dreams and hysteria into the very forefront of psychological debate. It is probable that the immediate future will see a much closer *rapprochement* between psychology and mental pathology than has been realized hitherto; so that, on the one hand, mental disorders and diseases will be studied scientifically as well as handled therapeutically, and on the other hand systematic psychology will devote special chapters to a detailed consideration of typical abnormalities.

MENTAL PROCESS. A phrase employed by modern psychology in two nearly related meanings. 1. In the first place, it is tending to replace the older static conception of mind (q.v.). Stout, e.g., defines psychology as "the positive science of mental process," in preference to speaking of it as the science of mind, and James declares that "the first fact for us as psychologists is [not that mind exists, but] that thinking of some sort goes on. . . . If we could say in English 'it thinks,' as we say 'it rains' or 'it blows,' we should be stating the fact most simply." 2. But not only is mind, as a whole, a stream of thought and feeling; each separate element of mind or mental formation that our analysis teases out of the total consciousness is itself a process. Every sensation rises, poises, falls, in its own characteristic way; even the idea, the mental thing par excellence, is termed by Wundt a "variable process," and such formations as emotion and volition bear the mark of process stamped upon them. Meaning (q.v.) and mode of connection (see FUSION; IMPULSE) are stable, but the stuff of which mind is made is essentially durative process and not stable being. Consult: *Philosophische Studien*, vols. vi, x (Leipzig, 1891, 1894); G. F. Stout, *Analytic Psychology* (London, 1896); William James, *Principles of Psychology*, vol. i (New York, 1909); E. B. Titchener, *Textbook of Psychology* (ib., 1910); *American Journal of Psychology*, vol. xxiii (Worcester, 1912).

MENTAL SCIENCE. The name given to a metaphysical system which aims to cure diseases without drugs. Its history goes back to the early Christian centuries and has sometimes been religious and sometimes philosophical. Eginhard, an intimate of Charlemagne, was the first to make recorded observations in any way analogous to modern medical cases of mental healing. In the time of Charles II and Queen Anne special powers were attributed to royalty in the laying on of hands for the healing of the sick. Parson Blumhardt emphasized the religious element in healing about a century ago, and P. P. Quimby was most conspicuous in the work in the middle of the nineteenth century in America. Since his day there has been a succession of mental healers, including the Dressers, Mary Baker Eddy (q.v.), John Alexander Dowie (q.v.), A. B. Simpson, of New York, Francis Schlatter (q.v.), Schrader, Bradley Newall, and Paul Dubois, professor of psychotherapy in the University of Bern, Switzerland. All of them endeavored to prevent disease whenever possible. All have tried to awaken in the individual the inherent but latent forces of health through the medium of literature, lecture courses, heterosuggestion and autosuggestion. Most of them encouraged the formation of reading circles and other social expedients for keeping the mind fixed on the subject of good health.

In the last half century there has been a differentiation of the groups of Mental Science healers, with the result that there are to-day Christian Scientists, adherents of New Thought, and other groups. The Christian Scientists, while in general holding to the Mental Science idea, have developed a metaphysics of their own based on the concept that matter has no real existence, and have turned the small circles of the older days of Christian Science into organized churches throughout the United States with special responsibility to the Mother Church in Boston. The New Thought group do not deny the reality of matter

and have not developed large circles of adherents, but follow in the main the teachings of men like Horatio W. Dresser, Stanton Davis Kirkham, Henry Wood, Ralph Waldo Trine, and Thomas Troward. Such men as Paul Dubois, who have perceptibly influenced the practice of medicine, have as their metaphysics some form of materialism rather than idealism, and emphasize what Dubois calls persuasion rather than suggestion. Those who regard themselves as Mental Scientists are largely individualists and have no general organization. They agree in looking upon all schemes of cure as mere expedients. They insist that man lives in a physical phase of consciousness rather than in a physical world, and that to rise out of this consciousness to what the New Thought group and Christian Scientists call a spiritual conception would involve the break-up of their conception of life and being. They urge that each individual must in a final analysis think for himself, and be content to be what he thinks he is because he thinks he is. Mental Science, therefore, while often materialistic is also individualistic, and it is in consequence impossible to determine the number of its adherents. See CHRISTIAN SCIENCE; FAITH CURE; HYPNOTISM; MESMERISM; NEW THOUGHT; PSYCHOTHERAPY; SUGGESTION.

MENTAL TESTS. Procedures whose purpose is the determination, in an individual, of the presence or absence of a particular mental content, or of the degree of a particular mental function or capacity. The term is also employed, somewhat loosely, in cases where the function upon which the procedure is directed is itself imperfectly known, or is measured only indirectly, or is (so far as we know) rather a psychophysical than a strictly mental function. We speak, e.g., of "tests" of color-blindness, of pitch discrimination, of intelligence, and of fatigue. (See these titles.) Less formally, mental tests are characterized by simplicity of technique, relatively short duration, and emphasis upon quantitative determination rather than upon qualitative analysis and direct description. They are usually, moreover, standardized procedures, applied to a number of individuals for the purpose of measuring the variation within groups, or to a single individual because of a practical interest in that person. Mental tests accordingly furnish data primarily for individual psychology (q.v.) or for applied psychology (see PSYCHOLOGY, APPLIED), and contribute only indirectly to the general science of psychology.

As early as 1877 Francis Galton suggested the use of the reaction experiment for the diagnosis of temperament. In connection with anthropological measurements of weight, height, eye color, and the like, he further developed a number of simple tests which he hoped would make it possible to "obtain a general knowledge of the capacities of a man by sinking shafts, as it were, at a few critical points."

In the early nineties of the past century mental tests came into prominence in America. Here interest centred in the question of the relation of mental to physical variations, in the determination of the range and the types of mental variation as a methodological prerequisite of general psychology, and in the problems of class and child psychology. For the most part the tests resembled experiments already employed by psychology in the investigation of

the simpler mental processes. Experiments were chosen whose results could be quantitatively expressed, and which seemed likely to exhibit wide or practically significant differences; their technique was so simplified as to make practicable their application to large numbers of individuals. In Germany, a few years later, tests of a similar character were developed; the principal interest in this case was the diagnosis of insanity and the analysis of the abnormal mind. At about the same time, in France, interest in individual psychology led to the formation of tests of a somewhat different kind. In particular, Alfred Binet and his followers were of the opinion that the more specific functions (such as ability to discriminate tones or colors or to judge time intervals) not only varied less widely among individuals, but also were of less importance in the constitution of individuality, than the more general or higher functions, such as imagination, comprehension, intelligence, suggestibility, and sentiment. Here, then, since methods of investigation had not yet been devised, adaptation of already existing procedures was impossible, and the invention of new tests was a preliminary to further work.

The inventor of such a test necessarily starts with a conception (derived from theoretical or common-sense psychology) of the function to be tested, and proceeds to lay down a procedure to suit this conception. Intelligence, e.g., has been conceived as essentially an ability to combine impressions into a unified and related whole; and the test of intelligence then takes the form of filling in the gaps of a mutilated text. Tests of this sort, however, unlike the adapted tests, hardly ever measure the supposed function directly; they are merely diagnostic, or expressive of the degree of the given function; and, however valuable they may be for practical purposes, they contribute little to scientific knowledge. The single test, moreover, is inexact in that it almost certainly involves other functions than that upon which it is directed. The result of a selected series of tests, all intended to reflect a single function, is likely to give a truer measurement, and it is upon such series that the practice of the present time chiefly depends. Probably the most famous series of tests yet devised is the Binet-Simon series of graded tests. The primary purpose of these tests is the practical determination of the degree of intelligence of a child and his consequent classification as normal (i.e., as having an intelligence equal to that of the average child of his age), subnormal, or supernormal. The Binet-Simon series of 1908 comprises 56 single tests, a group of which is assigned to each age from three to twelve. A certain minimum of performance in every test constitutes a "pass"; and the subject is graded on the basis of number of tests passed, as having a degree of intelligence normal to such-and-such a year. A subject whose rank places him three years behind the normal for his age is considered mentally defective. The tests themselves are in reality simple tasks, so chosen that so far as possible their performance cannot be materially affected by formal coaching or school training. A normally intelligent three-year-old child, e.g., is required to repeat correctly after the experimenter three digits, to repeat a simple sentence containing six syllables, to tell his family name, etc.; a child of nine, to tell the day of the month, to give the days of the week in order in 10 seconds, to make change (returning 21

cents from a quarter dollar), and the like. Beside success and failure, however, peculiarities of performance in many of the tests are considered diagnostic, so that entirely satisfactory administration of the tests and the drawing of reliable conclusions therefrom seem to demand a very careful and practiced experimenter. Binet's insight into the nature of the child's mind and his ingenuity in devising not only the general scheme of the test series but also the details of method are amply attested by the fact that the series still remains essentially as he left it in 1908 in spite of severe practical trials in nearly every civilized country. Criticism has resulted, for the most part, only in modification and extension of the series.

It has been pointed out that tests which shall permit of more accurate quantitative results than are furnished by statements of mere success or failure, and also that more specific qualitative tests, are desirable; and series possessing these advantages are at present in process of development. A further recent tendency is towards the development of tests which shall determine the fitness of individuals to enter various trades or careers.

MENTANA, mën-tä'nä. A village in Italy, 13 miles northeast of Rome, with 2379 inhabitants in 1911. It is noted as the place where, on Nov. 3, 1867, Garibaldi was defeated by papal and French troops while attempting to seize Rome and thus complete the unity of Italy. On Nov. 25, 1877, a monument was erected in honor of the adherents of Garibaldi, who was taken prisoner in this battle. See GARIBALDI.

MENTCHIKOV, ALEXANDER DANILOVITCH. See MENSCHIKOV, A. D.

MEN'TEL (or MENTELIN), JOHANNES (c.1410-78). A German printer of the fifteenth century, the first to establish a press at Strassburg. To him the invention of printing was once attributed by many. The erroneous character of such an assertion was very clearly demonstrated by Von der Linde in the results of his investigation of the early history of printing in his *Gutenberg* (Stuttgart, 1878).

MENTER, SOPHIE (1848-1918). A German pianist, born at Munich, in which city she subsequently studied under Schönnchen, Lebert, and Niest, making her début in 1863. She met with extraordinary success, particularly at Frankfort, where, in 1867, Tausig (q.v.) secured her as a pupil. Two years later she won the good will of Liszt, who became one of her staunchest friends. She made many tours and had many famous pupils, and finally retired to her home, Castle Itter, in the Tirol. Meanwhile she had become known as a remarkable virtuoso, and besides her appointments as court pianist to the Prince of Hohenzollern and the Emperor of Austria, she

served for a time on the faculty of the St. Petersburg Conservatory. In 1872 she married the cellist Popper, from whom she was subsequently divorced (1886).

MENTEUR, män'tēr', LE (Fr., The Liar). A comedy by Corneille (1644), modeled after Alarcón's *Verdad sospechosa*. The play is Corneille's best comedy, and the most important before the appearance of Molière.

MENTHA. See MINT.

MENTHOL (from Lat. *mentha*, mint), or **PARA-MENTHANOL** (3), or **PROPANOL** (3), $C_{10}H_{18}OH$. A colorless crystalline substance obtained from official oil of peppermint, or from Japanese or Chinese oil of peppermint. The oil is subjected to fractional distillation, and the higher-boiling fractions are allowed to crystallize, the product being purified by recrystallization. It has the odor of peppermint and produces in the mouth a sensation of cold. It is but sparingly soluble in water, but dissolves in considerable quantities in alcohol, ether, chloroform, and other organic liquids. It is often used, especially in solution in oleic acid, as a remedy for neuralgic headache. In a solution of ten parts of alcohol to one of menthol, or in the solid form of a pencil it usually gives immediate, though not always complete, relief, when applied to the seat of pain. It has also been used to relieve itching and in asthma. Internally it has been used in small doses to relieve nausea. Finally, it is used in perfumery. Menthol melts at 43° C. (109.4° F.) and boils at 211-213° C. (412-415° F.). When dissolved in four times its weight of alcohol, in a tube 1 decimeter long, it turns the plane of polarized light 49.3° to the left per gram per cubic centimeter of solution.

The ordinary menthol just described has also been obtained synthetically. But synthesis has also produced three other varieties of menthol, having the same ultimate composition as natural menthol and differing from it only in the position occupied in the molecule by the OH group. These varieties, or "isomers," of menthol are known as *carvomenthol*, *tertiary menthol*, and *tertiary carvomenthol*.

MENTONE, mën-tō'nä, Fr. **MENTON**, män'tôn'. A seaport town in the Department of Alpes-Maritimes, France, on the Mediterranean, 19 miles east-northeast of Nice (Map: France, S., M 5). It is situated on the Golfe de la Paix, which here breaks into two small bays. On the north is a sheltering range of lofty mountains, the lower slopes of which are covered with orange, lemon, and olive groves, and dotted with picturesque villas and gardens. The inclosed situation of the town, dry and equable climate, and other natural advantages make Mentone one of the most popular of invalid resorts on the Riviera. The town built along the shore as a resort is modern, while the old portion retains a mediæval aspect, with narrow, winding streets; the newer portion is regularly laid out and clean. The prominent buildings are the churches of St. Michel (seventeenth century) and of the Conception; the hôtel de ville has an interesting museum of prehistoric relics. On the west coast of the bay near Cap Martin is the villa of the former Empress Eugénie. Mentone has a number of fine boulevards, the Promenade du Midi skirting the bay, and several public gardens. The chief point of interest, however, is in certain grottoes near by, in Italian territory, where Rivière discovered relics of ancient human occupation. In one of these caves, now known as the

"Grotte des Enfants" two skeletons were found at great depth to which the name "Grimaldi" man has been given (see MAN, SCIENCE OF). Mentone's harbor accommodates vessels of 26 feet draft. Mentone produces annually 45,000-000 lemons, also figs, olives, and perfumes, and has an extensive trade in fruit and olive oil. Pop. (commune), 1911, 18,001. After belonging for 500 years to Monaco, the town revolted in 1848 and attached itself to Sardinia. With the cession of Nice to France in 1861 Mentone came under French rule, the Prince of Monaco ceding his rights to France for 4,000,000 francs. Consult *Bulletins de la Société d'Anthropologie de Paris*, series 4, vol. ix (Paris, 1898), and Mortillet, *Le préhistorique* (ib., 1900).

MENTOR (Lat., from Gk. *Mēvrop*). The son of Alcinus of Ithaca, the trusted friend of Ulysses, who, on setting out for Troy, left to him the charge of his household and the education of Telemachus. His name has become proverbial for a wise guide and counselor; as such he figures especially in Fénelon's *Télémaque*.

MENTU. See MONT.

MENU VON MINUTOLI, HEINRICH, BARON. See MINUTOLI, HEINRICH, BARON MENU VON.

MENYANTHES, mēn'i-ānthēz. A genus of plants. See BUCK BEAN; Plate of BRAZIL NUT.

MENZALEH, mēn-zā'le, LAKE. A lagoon on the northeast coast of Egypt, extending from the Damietta branch of the Nile to the Suez Canal, and separated from the Mediterranean by narrow sand bars (Map: Egypt, F 1). It is 30 miles in length by about 20 miles in average breadth, is very shallow, and studded with low islands, on one of which are the remains of the ancient city of Tennesus. The lagoon has valuable fisheries, besides producing much salt.

MENZEL, mēn'tsel, ADOLF VON (1815-1905). A German historical and genre painter, one of the foremost of the nineteenth century; also an important illustrator and lithographer. He was born at Breslau, Dec. 8, 1815, and as a lad assisted his father, a lithographer, in his work. The family removed to Berlin in 1830, and in the summer of 1833 Menzel attended the Academy schools, but soon relinquished as unprofitable the ordinary routine of training, and may truly be called self-taught. His father's death in 1832 threw the support of the family upon his shoulders and he worked hard at lithographic commissions. In 1833 he executed for the publisher Sachse "The Artist's Earthly Pilgrimage," a series of 10 drawings in pen and ink illustrating Goethe's poem, "Künstler's Erdenwallen," which attracted immediate attention. The real beginning of Menzel's triumphs was the year 1839, when he began the illustration of Kugler's *History of Frederick the Great*, a task occupying three years. These 400 designs, drawn in pencil on wood and reproduced in facsimile, brought him royal and popular favor and gave a new impetus to the art of wood engraving in Germany. This work was followed by a commission for King Frederick William IV for 200 illustrations of the edition de luxe of Frederick the Great's *Works* (1843-49), intended as a royal present to German and other notables (new ed., 2 vols., Berlin, 1886). He designed also many vignettes and other illustrations, and he invented new methods in lithography and gouache. Menzel began to paint at the age of 20, without formal instruction.

Of his paintings the best known are the epi-

sodes from the history of the great Prussian monarch. The historical fidelity, clever characterization, droll humor, and sound naturalism displayed in these compositions, combined with his thorough mastery of technique, rank Menzel as one of the dominant painters of Germany during the nineteenth century. He was, moreover, the first German painter to become imbued with the spirit of modern realism, of which he was the earliest pioneer. But as none ventured to follow him he exercised but little influence on the development of German art. He appears as the painter-historian of the modern Hohenzollern in another series, of which the "Coronation of King William I at Königsberg," in the Royal Palace, Berlin, and "Departure of the King for the Seat of War in 1870" (1871), in the National Gallery, Berlin, are the most conspicuous examples. Among a great variety of genre pictures the "Modern Cyclops" (1875, National Gallery, Berlin), representing the interior of a rolling mill in Silesia, is a sterling piece of realistic characterization and of masterly light effects. Remarkable for this latter quality, as well as for its keen satire, is "The Ball Supper" (1879), and a later noteworthy example is the "Ash Wednesday Morning" (1885), in the National Gallery, Berlin. Besides receiving various other honors, Menzel was made a Privy Councillor in 1895, and received the Order of the Black Eagle, conferring hereditary nobility, in 1898. He died in Berlin Feb. 9, 1905.

Bibliography. Lives by Sondermann (Magdeburg, 1895), Knackfuss (Bielefeld, 1895), and Meyerheim (Berlin, 1906); also Waldstein, in *Magazine of Art* (London, 1884, 1901); Marx Jordan, *Das Werk Adolf Menzels, 1815-1905, mit einer Biographie des Künstlers* (Munich, 1905); Von Tschudi, *Adolf von Menzel: Abbildungen seiner Gemälde und Studien* (ib., 1905); *Aus Menzels Jungen Jahren* (Berlin, 1906); Meier-Graefe, *Der junge Menzel* (Leipzig, 1906); *Menzels Briefe*, edited by Wolff (Berlin, 1914); Singer, *Drawings of Adolf von Menzel* (London, n. d.).

MENZEL, WOLFGANG (1798-1873). A German historian and critic, born at Waldenburg, Silesia. He studied at Jena and Bonn, became an ardent disciple of Jahn (q.v.) and the Turner movement, taught (1820-24) at Aarau, in Switzerland, and from 1825 lived as a man of letters at Stuttgart, where he edited the *Litteraturblatt* (1826-48; again in 1852). From 1830 to 1838 he belonged to the Württemberg Diet. Unsuccessful in politics, he gave himself up to literature, assailed Goethe, and was himself mercilessly attacked by Heine and others. His popular *Geschichte der Deutschen* came out in 1824-25; *Die Geschichte Europas 1789-1814*, in 1853. His strongly monarchical tendencies develop in other histories. He wrote the dramatic fairy tales *Rübezahl* (1829) and *Narcissus* (1830), and an historical novel, *Furore* (1851). *Die deutsche Dichtung von der ältesten bis auf die neueste Zeit* (Stuttgart, 1858-59; 2d ed., 1875) is worthy of mention. His *Deutsche Litteratur* (1828) can be studied in *Specimens of Foreign Literature* (Boston, 1840). Consult also his autobiographical *Denkwürdigkeiten* (Bielefeld, 1876) and R. M. Meyer in *Gestalten und Probleme* (Berlin, 1905).

MENZELINSK, mēn'tsel-insk'. A town of east Russia in the Government of Ufa, situated on a branch of the Kama, 125 miles northwest of Ufa (Map: Russia, H 3). Important fairs

are held here annually, in which miscellaneous goods are sold approximating the value of \$2,-000,000. Pop., 1897, 7542; 1910, 8573.

MENZIES, mēn'ziz or mēn'yiz, ALLAN (1845-1916). A Scottish theologian, born in Edinburgh and educated at the universities of Edinburgh and St. Andrews. In 1873 he became minister of Abernethy, Perth, and in 1889 was chosen professor of divinity and biblical criticism in St. Mary's College, St. Andrews. Dr. Menzies, who had studied in Germany, translated into English Baur's *Paul* (1873-75) and *Church History of the First Three Centuries* (1878-79) and Pfeiderer's *Philosophy of Religion* (1886-88). He edited the supplementary series *Ante-Nicene Fathers* (10 vols., 1886-96) and wrote: *National Religion* (1888); *History of Religion* (1895); *The Earliest Gospel* (1901), a study of St. Mark; *Second Corinthians* (1912).

MEPH'ISTOPH'ES (formerly also *Mephostophilus*, *Mephostophilis*; of uncertain derivation, perhaps from Gk. μῆ, mē, not + φῶς, phōs, light + φῖλος, philos, loving). A term which appears first in the German *Faustbuch* (1587) as the name of the devil who tempts Faust. The name is perpetuated in Marlowe's play, *Dr. Faustus*. In Goethe's *Faust* he is developed into the scoffing "spirit that denies." The figure comes from the mediæval demonology, but the particular origin or meaning is now lost.

MEP'PEL. A town in the Province of Orenthe, Netherlands, situated on the Meppeler Diep, 16 miles northeast of Zwolle (Map: Netherlands, E 2). It is an important centre for butter, eggs, cattle, and hogs, has calico and canvas manufactures and shipbuilding yards. Pop., 1900, 10,154; 1910, 11,000.

MEQUINEZ, mēk'ī-nēz, or **MEK'NEZ**. A noted town of Morocco, Africa, situated in a mountainous region 37 miles southwest of Fez (Map: Africa, D 1). It is still one of the finest cities of Morocco, although it has greatly declined since the eighteenth century, when it had attained unusual magnificence under the Sultan Muley Ismail. It is inclosed by a wall, pierced by nine gates, some of which are remarkable for their Moorish tile decorations. It is surrounded by extensive olive groves and has a fine mosque, which is visited by pilgrims, and a palace of the Sultan. It is of little commercial or industrial importance, its chief manufactures being earthenware and leather goods. The population is estimated at from 25,000 to 50,000.

MERAN, mā-rän'. A famous health resort in Tirol, Austria, 1045 feet above the sea, situated on the Passer, about 40 miles south-southwest of Innsbruck (Map: Austria, B 3). It lies at the foot of the Küchelberg and is noted for its salubrious and moderate climate. The vicinity abounds in picturesque old castles, châteaux, and villas, and fine promenades extend along both banks of the Passer. The principal street, Unter den Lauben, flanked with arcades, contains the fifteenth-century burg—the residence (till 1490) of the counts of Tirol and now in its restored condition serving as a museum. The season lasts from the beginning of fall to the end of spring, and the annual number of patients exceeds 10,000. Meran is provided with several churches, schools, a municipal museum, and a theatre. Its institutions include a Benedictine's school and a boarding school for English girls. The château of Leberberg, south of Meran, is also of no little interest. Meran is first mentioned as Mairania in 887. It manufactures furniture, breadstuffs,

gold and silver ware, and does a thriving business in fruit and wine. It became a town at the end of the thirteenth century. Pop., 1900, 9284; 1910, 11,568.

MERAN, AGNES OF. See AGNES OF MERAN.

MERBECK, JOHN. See MARBECK, JOHN.

MERCADANTE, mēr'kà-dän'tà, FRANCESCO SAVERIO (1797-1870). A celebrated Italian musician, born at Altamura. He studied the violin and the flute under Zingarelli at the Conservatory San Sebastiano at Naples, but soon turned his attention to compositions for the voice. In 1818 he produced a grand cantata, entitled *L'unione delle belli arti*, which was performed at the Teatro Fondo and which met with a very favorable reception. This led to an engagement at the Teatro San Carlo, where his first opera, *L'apoteosi d'Ercole* (1819), was well received. In 1833 he was appointed chapelmaster at the cathedral of Novara, and in 1836 his opera *I briganti* was performed in Paris with an extraordinary cast, which consisted of Rubini, Tamburino, Lablache, and Grisi. He was made director of the royal conservatory at Naples in 1840, but became totally blind in 1862. He composed about 60 operas, 20 masses, and much Church music. He died at Naples.

MERCALLI, mēr-kāl'lē, GIUSEPPE (1850-1914). An Italian geologist. He was born in Milan, entered the Roman Catholic priesthood, and taught natural science at Monzo and Domodossola and in the Milan seminary. He had liberal tendencies and was removed from his chair in Milan when he was so indiscreet as to subscribe publicly to a national monument for Rosmini-Serbatì. He then became a teacher in the government's *licei*—first at Reggio di Calabria for three years, then for 23 years at Naples, where he also lectured in the university—and after 1911 was director of the Vesuvius Observatory. He was burned to death by an overturned lamp in his study on March 19, 1914. His early work in northern Italy was on glacial action. He devised a scale (called by his name) for measuring earthquake shocks. More important were his vulcanological studies, first at Etna and then at Vesuvius; his "Notizie Vesuviane" appeared in the *Bollettino* of the Società Sismologica Italiana (1892-1906). His book *I vulcani attivi della terra* (1907) is one of the most valuable general works on volcanoes.

MER/CANTILE AGENCY. "An institution which, for a subscription price, agrees to collect information as to the financial condition and responsibility of business men and to transmit the same to its subscribers." At times it also undertakes the collection of debts for its customers. It originated in the United States, during the period of depression following the panic of 1837, and its avowed object was to uphold, extend, and render safe and profitable to all concerned the great credit system which had grown up with the increase of commerce. The first mercantile agency was established in New York during the year 1841 by Lewis Tappan and was followed the next year by a similar agency under the control of Woodward and Dusenbury.

While originally established for the purpose of answering questions about the financial standing of particular persons, the scope of the agency has been extended, until its records contain the financial ratings of nearly every business man in the country. In addition to the general agencies, such as Dun & Co. and the Bradstreet Company, there are many special agencies which

confine themselves to particular lines of trade. By the general agencies the country is divided into districts, in each of which is a managing agent with various correspondents in the several localities. If a subscriber wishes more minute or more recent information than that contained in the agency's periodical reports, he asks for and receives a special report brought down to date.

While a mercantile agency is employed by its subscribers to do certain things for them, it is not in the strict sense their agent (q.v.) in these transactions; it is rather an independent contractor. It engages to accomplish a stipulated result, but is entirely free to accomplish this in its own way and with its own instrumentalities. If, in obtaining and publishing information, it does a legal wrong to third persons, it is responsible therefor, but its employers are not. A statement made to a subscriber asking for it is generally held to be conditionally privileged, but when made to other subscribers who have no interest in the information it is not privileged. In a case of the former kind the plaintiff would be obliged, therefore, to prove actual malice, or malice in fact, to sustain an action for libel, slander, or the like on the part of the agency; but in the latter case he would not.

A subscriber who is misled to his injury by acting upon false information supplied by the agency is generally entitled to damages against it. Most agencies, however, require their patrons to agree that the agency shall not be responsible for any loss caused by the neglect of any of its servants, clerks, attorneys, or employees in procuring, collecting, and communicating information. Such agreements have been upheld by several courts. If, however, after correct information has been received by the agency, a blunder is made by its managers in printing it, the agency should be held liable, and such a decision was made by the Supreme Court of Pennsylvania. When a business man makes false statements about his financial condition to a mercantile agency, and this is communicated to a third party who acts upon it to his injury, the third party has as good cause of action in deceit (q.v.) against the business man as though the statement had been made directly to him. Consult J. W. Errant, *The Law Relating to Mercantile Agencies* (Philadelphia, 1889), and Reinhard, *A Treatise on the Law of Agency* (Indianapolis, 1902).

MERCANTILE AGENT. In the absence of a statutory definition, specifically one who acts as agent for another in important commercial transactions. It does not include a mere servant, caretaker, or a merchant's clerk or salesman, or a common carrier. The present Factors Act in England (52 and 53 Vict., c. 45, § 1) defines the term as an "agent having in the customary course of his business as such agent authority either to sell goods, or to consign goods for the purpose of sale, or to buy goods, or to raise money in the security of goods." This is the signification in which the term is most frequently used in current law literature. The rights and obligations of such an agent, both with respect to his principal, or employer, and to third parties, are governed by the general law of agency. See AGENT; FACTOR; PRINCIPAL AND AGENT.

MERCANTILE LAW. A term which at present covers a rather indefinite domain in English law. It is ordinarily applied to a group

of topics more or less closely related and having this element in common—that they have originated in, or been greatly modified by, the usages and customs of merchants. The legal rules governing these various topics do not form a separate and independent branch of jurisprudence: they cannot be called a distinct and homogeneous body of law. In the leading English treatises on this subject mercantile law is viewed as comprising the law of partnership, joint-stock companies, agency, negotiable paper, contracts with carriers, insurance, sale, bottomry and respondentia, debt, guaranty, stoppage in transitu, lien, and bankruptcy.

Much of the law upon these subjects is of ancient origin, coming to us from the Roman civil law and later codes. For a discussion of this early development, see LAW MERCHANT. For the law upon the various subjects included under the term "mercantile law," such as partnership, lien, etc., see those titles.

MERCANTILISM. The system of economic policy evolved by the European states after the decay of the feudal system. In essence it represented a transition from local and territorial to national economy. In the earlier period each town had regulated industry in the exclusive interest of its own inhabitants, treating the citizens of other towns as aliens who could trade in the town only after submitting to such restrictions as the town government chose to impose. It was the purpose of the mercantilist statesmen to break down the barriers to internal intercourse and to unite the state in a single economic organism in rivalry with other states.

The practical measures by which the mercantilist statesmen sought to attain national power were: (1) the accumulation within the state of a large amount of the precious metals; (2) the encouragement of agriculture; (3) the development of manufactures; and (4) the creation of a mercantile marine. In the writings of the exponents of mercantilist doctrine especial emphasis was devoted to the acquisition of treasure. The European states were rapidly passing from an economic order in which payments in kind prevailed to an economy based upon money transactions, and as a consequence the great importance of a sufficient stock of the precious metals occupied a large share of the attention of statesmen. In the earlier mercantile period an effort had been made to prevent the exportation of bullion altogether. Later it came to be recognized that bullion sent abroad in the way of exchange might result in an ultimate increase in the stock of bullion at home. Statesmen then concentrated their attention upon securing a favorable balance of trade. It was believed that one way of attaining this end was to encourage the exportation of finished commodities and the importation of raw materials, since in this way, it appeared, a greater value would be exported than imported.

Manufactures were encouraged because they furnished materials for commerce, helping thereby to secure the so-called favorable balance of trade. Agriculture took a subordinate position, but it was held deserving of encouragement as a source of abundance of raw material. The growth of population was desired in order to have an ample supply of cheap labor power. Cheap agricultural products and cheap labor were regarded as objects to be striven for, and herein we see a difference between mercantilism and modern protectionism, the avowed claims of

which are high prices for agricultural as well as other products and high wages for labor. In England the earlier prohibition of exportation of grain, which had been calculated to favor the consumer, was succeeded by prohibition of importation when prices fell below a certain figure, in order that tillage might be uniformly profitable. Manufacturers were stimulated by high duties, or even by prohibition of imports, and by numerous sumptuary laws favoring domestic manufactures. The aim here was twofold: to attain national economic independence and to prevent the export of bullion in payment for foreign goods. Finally, the encouragement of shipping was naturally regarded as of the greatest consequence at the time, since the new trade with America and the Orient rapidly enriched the nations which controlled it. For the mercantilist navigation policy, see NAVIGATION LAWS.

Mercantilism as a definite policy first appears in English history at the end of the fourteenth century; not much later it was also the settled policy of France. In England it reached its height under Elizabeth; in France under Colbert in the seventeenth century. From that time pure mercantilism rapidly decayed, degenerating into a complicated system of discriminating duties designed to favor private interests instead of those of the state as a whole. It was mercantilism of this kind against which Adam Smith directed his criticisms, which prejudiced economic writers for a century against the system. Recent historical investigations have, however, demonstrated that at its best mercantilism represented a great advance in economic policy and that it was effective in bringing about national unity and independence. See INTERNATIONAL TRADE; PROTECTION; BALANCE OF TRADE; PHYSIOCRATS; NAVIGATION LAWS.

Bibliography. Perhaps the best presentation of a moderate mercantilism by an advocate is that found in Sir James Steuart's *Inquiry into the Principles of Political Economy* (London, 1767). For the older critical attitude towards mercantilism, consult Adam Smith, *Wealth of Nations*, book iv (New York, 1904). By far the best statement of the modern view is G. Schmoller, *Mercantile System* (Eng. trans., New York, 1896); also F. K. Mann, *Der Marschall Vauban und die Volkswirtschaftslehre des Absolutismus; eine Kritik der Merkantilismen* (Munich, 1914), containing a bibliography.

MERCANTILISTS. See POLITICAL ECONOMY.

MERCAPTANS (from Lat. *mercurius*, mercury, quicksilver + *captans*, pres. p. of *capture*, frequentative of *capere*, to take; so called as absorbing mercury), or THIOALCOHOLS. A class of carbon compounds analogous to the alcohols. The latter are defined as compounds containing one or more OH (hydroxyl) groups directly combined with hydrocarbon groups like methyl (CH_3), ethyl (C_2H_5), etc. Similarly, the mercaptans may be defined as compounds containing one or more SH (sulphur and hydrogen) groups directly combined with hydrocarbon groups. Thus, methyl alcohol has the constitution CH_3OH ; methyl mercaptan the constitution CH_3SH ; ethyl alcohol has the constitution $\text{C}_2\text{H}_5\text{OH}$, ethyl mercaptan the constitution $\text{C}_2\text{H}_5\text{SH}$; etc. The following are the principal methods used in the preparation of mercaptans: (1) by the action of an alcoholic solution of potassium sulphohydrate (KSH) upon halogen

derivatives of the hydrocarbons (CH_3Cl , $\text{C}_2\text{H}_5\text{Cl}$, etc.); (2) by distilling an aqueous solution of potassium sulphohydrate with salts of acids like the well-known ethyl-sulphuric acid; (3) by heating alcohols (or phenols) with the pentasulphide of phosphorus, P_2S_5 . Thus methyl mercaptan may be prepared according to either of the following reactions:

Most mercaptans are liquid, though some exist, at ordinary temperatures, in the solid state. The liquid mercaptans are much more volatile than the corresponding alcohols. They are only sparingly soluble in water, but mix freely with alcohol or ether. Their most characteristic property, however, is their exceedingly offensive odor, by which, according to Emil Fischer and Penzoldt, a quantity of ethyl mercaptan can be detected that is 250 times more minute than the smallest amount of sodium that can be revealed by the spectroscope. The hydrogen of the SH group of a mercaptan can be replaced by metals. The resulting substances, called mercaptides, are decomposed by acids, but—unlike the alcoholates (see ALCOHOLS)—they are unaffected by pure water. The ethyl mercaptide of mercury is formed according to the following equation:

How much more strongly acidic mercaptans are than alcohols may be seen from the fact that mercaptans, in alcoholic solution, are capable of taking metals away from their acetates and forming, of course, the corresponding mercaptides. The first mercaptan ever prepared was ethyl mercaptan, which was obtained by Zeise in 1833. It is now extensively used in the manufacture of sulphonal (q.v.), a well-known hypnotic.

MERCAPTIDES. See MERCAPTANS.

MERCATOR, GERARDUS (Latinized form of GERHARD KREMER) (1512-94). A Flemish mathematician and geographer, born in Rupelmonde. He took his degree in philosophy at the University of Louvain and later made a profound study of the sciences of geography and mathematics. In 1534 he opened a geographical shop in Louvain and did much work for Emperor Charles V during his campaigns. In 1552 he moved to Duisburg, where in 1559 he was appointed cosmographer to the Duke of Jülich and Cleves. His name is perpetuated by the projection used in nautical maps, in which the meridians are represented by parallel lines, and parallels of latitude by straight lines intersecting the meridians at right angles. The projection, however, seems to have been applied to nautical maps by Edward Wright. Besides a large number of maps, Mercator compiled series of geographical tables, *Nova et Aucta Orbis Terræ Descriptio ad Usum Navigantium* (1569) and *Tabulae Geographicae ad Mentem Ptolemæi Restitutæ* (1578). He also wrote a *Harmonia*

Evangeliorum (1592), but his chief work is *Atlas, sive Cosmographicae Meditationes de Fabrica Mundi et Fabricati Figura* (1594)—the maps were engraved by himself. This atlas was placed on the Index Expurgatorius.

MERCATOR (real name KAUFMANN), NICOLAUS (c.1620–87). A German mathematician, astronomer, and engineer, born at Cismar in the Duchy of Holstein. He was educated at the universities of Copenhagen and Rostock, and in 1660 or thereabouts went to London, where he became one of the first members of the Royal Society, then newly founded. Subsequently he proceeded to France, where he was appointed hydraulic engineer to direct the construction of the Versailles fountains. Owing to his refusal to accept the Roman Catholic faith, the sum agreed upon as payment for this work was withheld, and this fact is said to have hastened his death. He is credited with the discovery of several methods of calculation, in astronomy and higher mathematics. The most important one is the series for $\log(1+x)$. His publications include, besides contributions to the *Philosophical Transactions* of the Royal Society, *Cosmographia* (1651); *Astronomia Sphaerica* (1651); *Rationes Mathematicae Subductae* (1653); *Logarithmotechnia* (1668–74); *Institutionum Astronomicarum, Libri Duo* (1876). Consult Kaestner, *Geschichte der Mathematik* (Göttingen, 1796–1800), and Montucla, *Histoire des mathématiques* (Paris, 1799–1802).

MERCATOR'S PROJECTION. See CHART; MAP; MERCATOR, GERARDUS; NAVIGATION; SAILINGS.

MERCED, mēr-sēd'. A city and the county seat of Merced Co., Cal., 151 miles by rail southeast of San Francisco, on the Southern Pacific, the Atchison, Topeka, and Santa Fe, and the Yosemite Valley railroads, and near the San Joaquin and Merced rivers (Map: California, E 5). It contains the county hospital, a public library, a sanitarium, and a fine courthouse. Fruit growing, stock raising, farming, and dairying constitute the chief industries. Pop., 1900, 1969; 1910, 3102.

MERCEDES, mēr-sā'dās. A town in the Province of Buenos Aires, Argentina, situated on the Pacific Railroad, 36 miles west of Buenos Aires (Map: Argentina, G 4). It is a flourishing town in a rich sheep-raising region, has a normal school, a public library, and several steam mills and soap factories. Pop. (est.), 50,000. It was founded as a military station in 1779 and has been settled largely by Irish immigrants.

MERCENARIES (Lat. *mercenarius*, hiring, from *merces*, wages, from *merere*, to gain, deserve; connected with Gk. *μερῆσθαι*, *meiresthai*, to share, divide). Hired soldiers, usually foreigners in the country for which they fight. They have been employed from the earliest times. In the early Greek republics there was no standing army or mercenary force, but the citizens themselves formed a national militia. In Persia, however, there were large numbers of Greek mercenaries, and they appear to have played the same part which in later centuries the Swiss did in western Europe. The first Grecian state which used mercenaries in large numbers was Athens, and other Greek states soon followed this example, so that by the end of the Peloponnesian War there were a large number of men in Greece whose profession was war and who fought regardless of the cause. In Rome mercenary

troops were long used merely as auxiliaries, but about the fourth century A.D. the army began to assume the characteristics of a mercenary force, being composed largely of Germans, who finally overthrew the Western Empire. In the Byzantine Empire nearly all the troops were mercenaries.

But the golden age of mercenaries was in western Europe during the Middle Ages and the beginning of the modern era. In the early Middle Ages armies were recruited by a feudal levy, but when wars came to be waged on a larger scale in the twelfth century, the 40 days per year which the vassal had to serve proved insufficient, and instead the King or feudal lord began to commute the service of the vassal for a money payment and hire soldiers. In England itself, mercenaries were rare, though they did form one of the grievances against John and Henry III. On the Continent circumstances were different, and kings with a wide and scattered empire, like Henry II of England, who possessed a large part of France, were compelled to employ mercenaries of all kinds. At first it was common to buy their services by a gift of land, but by the twelfth century money became more common, and Norman knights, Genoese bowmen, and Flemish pikemen were frequently hired for pay. A fuller development was reached in the thirteenth century by the appearance of the condottiere system, in which some noted chief collected an army of free companions and sold his force as a whole. The first of these was Roger de Flor, who waged war successfully against the Byzantine Emperor Andronicus II. (See CATALAN GRAND COMPANY.) It was to this type that the various noted Italian adventurers belonged. The character of Italian civilization was of a kind to give impetus to the rise of a mercenary force, for the inhabitants of the many commercial city-states were unwarlike and at the same time frequently engaged in warfare. At times, however, the mercenaries turned their arms against the city which had hired them, or aided in imposing a tyrant upon the city, who then rewarded the company from the spoils. Thus arose in Milan the rule of the Visconti, in Verona that of the Scala, in Ferrara that of the Este, in Rimini that of the Malatesta. At the end of the fourteenth century the Italian mercenary met a dangerous rival in the Swiss pikeman. Switzerland was too small and poor to support all of its hardy sons, and they were sold in large numbers, usually by the canton itself, to some warlike prince. After the battle of Melegnano in 1515 they formed a valuable contingent in the French armies until the French Revolution. All parties in the Thirty Years' War used mercenaries to the exclusion of nearly all other troops, and to this fact is partly due the terrible devastation which was caused. In the American Revolution Great Britain used Hessian mercenaries to fight against the colonists, it being common for some of the smaller princes to sell their subjects in this fashion. The use of mercenaries on the Continent ended with the French Revolution, their place being taken by national standing armies. See BRABANÇONS; CONDOTTIERI; FREE LANCE; SWISS GUARD.

MERCER, FORT. See FORT MERCER.

MERCER, HENRY CHAPMAN (1856–). An American anthropologist and archaeologist, born at Doylestown, Pa., and educated at Harvard, where he graduated in 1879. He made

special studies of the relations of extinct animals to primeval man in North America, especially in connection with the mylodon, peccary, and sloth; made valuable discoveries of fossil carnivora in the Port Kennedy (Pa.) bone cave; and explored the caverns of Yucatan. After research on the Pennsylvania Dutch pottery manufactures he perfected a preparation for mural tiles in 1899; invented in 1902 a new process for making mosaics; and patented a system of printing large designs on paper and fabrics in 1904. He wrote: *Lenape Stone* (1885); *Hill Caves of Yucatan* (1896); *Researches upon the Antiquity of Man in the Delaware Valley and the Eastern United States* (1897); *Tools of the Nation Maker* (1897).

MERCER, HUGH (1720-77). An American soldier. He was born at Aberdeen, Scotland; was educated at the university there; entered the medical profession and served as assistant surgeon under Prince Charles Edward in 1745; emigrated to America in 1747 and settled as a physician near the site of the present Mercersburg, Pa. He served as captain under Braddock in 1755 and was severely wounded in the battle near Fort Duquesne. In 1758 he was promoted to be lieutenant colonel, accompanied General Forbes to Fort Duquesne, now Pittsburgh, and commanded that post for some time. Afterward he settled at Fredericksburg, Va., and on the approach of the Revolution took sides with the Patriot party. He organized and drilled the militia of Virginia in 1775 and the minutemen in 1776, and at Washington's request on June 5, 1776, was made a brigadier general by Congress. He commanded a column in the attack on Trenton and led the advance in the night march on Princeton, which he had himself advised. While rallying his temporarily disorganized troops early in the engagement at Princeton he was mortally wounded, and on January 12 he died in a neighboring farmhouse. A monument to his memory was erected at Laurel Hill Cemetery, Philadelphia, in 1840.

MERCERIZED COTTON. Cotton that has been treated by a chemical process which imparts a permanent silky lustre to the fabric, yarn, or thread. In 1844 John Mercer, an English chemist, discovered that caustic soda or caustic potash had a remarkable effect upon the cellulose structure of the cotton fibre, changing its physical and chemical nature, causing it to shrink and become thicker and softer, and increasing its affinity for dyes. Mercer took out patents in 1850, but no practical use was made of the discovery because the process shrunk the material so badly. In 1889 Lowe in Great Britain, and later in 1895 Thomas and Prevost, discovered that by treating the cloth under tension the shrinking was obviated and the material assumed, after being washed, a glossy appearance, like silk; but the former's patent was allowed to lapse, while that of the latter inventors was annulled. The lustring effect is, of course, now the most important object in the process. This effect is due to the changed structure of the fibres, which, under the action of the mercerizing treatment while under tension, become straight translucent tubes with a small round central opening instead of the spiral collapsed and flattened tube of the cotton fibre. The lustre is due to the fact that the surface becomes smooth and reflects light like the silk fibre. Mercerizing is now effected by machine processes. There are machines which

treat the yarn in hanks, those that treat the cloth, and those that are adapted for either. There are many forms of these machines in which yarn or cloth are treated in the lye, then, if desired, stretched as in a stretching machine with adjoining means of washing. By treating with acids it is further possible to imitate the scroop or viscous hardness supposed to be an essential mark of true silk, but which in reality in the case of silk is due to an artificial process also. Consult Paul Gardner, *Die Mercerization der Baumwolle und die Appretur der Mercerisierten Gewebe* (2d ed., Berlin, 1912), and Murphy, *The Textile Industries*, vol. vii (London, 1912).

MERCERSBURG. A borough in Franklin Co., Pa., 73 miles by rail southwest of Harrisburg, on a branch of the Cumberland Valley Railroad (Map: Pennsylvania, F 8). It was formerly a noted educational centre as the seat of institutions under the control of the Reformed church in the United States (German). Mercersburg Academy is located here. The principal interests are agriculture and leather manufacture. Mercersburg, originally called Black Town, was incorporated first in 1831. It was the birthplace of President James Buchanan. Pop., 1900, 956; 1910, 1410.

MERCERSBURG THEOLOGY. The name of a system of views emanating from the theological seminary of the German Reformed church formerly located at Mercersburg, Pa. (now at Lancaster), and chiefly defended by Prof. J. W. Nevin (q.v.). He insisted upon the true unity of the person of Christ and the genuinely human character of his life. The person of Christ was made central in the system. Christ is united with generic humanity, which develops itself by an inward force in the Church. Thus, the Church has a true theanthropic character. Emphasis was also laid upon the objective operation of the sacraments. Consult Nevin's principal work, *Mystical Presence* (Philadelphia, 1846), and his *Life* by Theodore Appel (ib., 1889).

MERCER UNIVERSITY. A Baptist university at Macon, Ga., founded in 1838. In 1914-15 it had a faculty of 21 and a student enrollment of 224 in the College of Liberal Arts, 85 in the Law Department, and 39 in Pharmacy. The library contained 20,000 volumes. Its endowment was \$400,000 and its income \$28,000. The grounds and buildings were valued at \$265,000.

MERCHANT, FRANCIS WALTER (1855-). A Canadian educator, born at Oil Springs, Ontario, and educated at Albert and Toronto universities, taking a degree in pedagogy at the latter institution in 1901. For several years he was a successful teacher in various high schools and collegiate institutes and was a lecturer in physics in Western University and College, London, Ontario. He was principal of the London (Ontario) Normal School (1900-08), chief inspector of public and separate schools and inspector of normal schools for Ontario (1908-11), and in 1911 was appointed Director of Industrial and Technical Education for Ontario. Several educational textbooks were prepared by him. He was appointed a senator of Knox College, Toronto, and was elected president of the Ontario Educational Association (1910).

MERCHANT, LAW. See **LAW MERCHANT.**

MERCHANTABLE ARTICLE. In the law of sale, an article that is salable in the market

under the name or description which it bears in the contract relating to it. Frequently a contract of sale expressly provides that the article to be delivered shall be merchantable; but even in the absence of such a statement a contract for the sale of goods by description, as for the sale of sugar or wheat or coal, implies an undertaking by the seller to supply an article which comes up to the merchantable standard. The buyer is not entitled to a perfect article, but he is entitled to one that is salable under its contract name. If the contract is for a quantity of Manila sugar, the buyer cannot insist upon absolutely pure sugar, but he can reject sugar that is adulterated to such an extent as not to pass in market as salable Manila sugar. Where the term "merchantable" is used in the contract, either party may show that it bears a peculiar meaning in the trade or in the locality in which the contract is made or to which it relates. See SALE.

MERCHANT MARINE, FOREIGN. See SHIP; SHIPPING.

MERCHANT MARINE OF THE UNITED STATES. The 13 Colonies which eventually became the United States lay along the seaboard, and the shipping interests constituted a large part of their commercial activities. In nearly all the Colonies, from the very first, shipbuilding had been encouraged, and in most of them it was a favored and protected industry. Notwithstanding the demand for men in their numerous wars with the Indians, French, and Spaniards, in many Colonies shipwrights were exempt from military service, and inducements were offered to ship carpenters in England to become colonists. A century before the Revolution shipbuilding in the northern Colonies had become one of the most important—in some the most important—of industrial occupations, and American-built ships were beginning to be sold in England. The unlimited supply and comparative cheapness of shipbuilding timber in the Colonies and its scarcity and higher cost in England caused the sales to British shipowners to increase so rapidly as to provoke resentment and protest from British shipbuilders as early as 1725. It is stated that in the seventeenth century the cost of American vessels (\$20 to \$40 per ton, depending upon the materials used) was 25 to 50 per cent less than that of similar ships built in England. In 1769, 389 were built of a total tonnage of 20,000. New Hampshire built 45, Massachusetts 137, Rhode Island 39, Connecticut 50, New York 19, New Jersey 4, Pennsylvania 22, Maryland 20, Virginia 27, North Carolina 12, South Carolina 12, Georgia 2. In each succeeding year the amount of new tonnage increased, reaching 26,544 in 1772. In 1775 it was estimated that one-third the ships flying the British flag were American-built.

The British Navigation Acts of 1651, 1660, 1661, and 1663 were chiefly designed to destroy the carrying trade of the Dutch between Great Britain and her Colonies and other countries. But, with the exception of the Act of 1651, they were also planned to curb the expansion of Colonial commerce and shipping, which were becoming so extensive as to excite the fears and opposition of British shipowners and politicians. The Act of 1661 enumerated the Colonial products which could not be lawfully transported in any except British ships bound to England, and the proclamation of 1663 declared that "no commodity of the growth, production, or manu-

facture of Europe shall be imported into the British plantations but such as are laden and put on board in England, Wales, or Berwick-on-Tweed, and in English-built shipping whereof the master and three-fourths the crew are English." This limited the Colonial commerce with Europe to direct trade with England. As this was chiefly in New England vessels, the other Colonies—especially those of the extreme south—were not greatly concerned. In 1733 an Act of Parliament was passed for the purpose of stopping, by means of prohibitory duties, the trade between the continental colonies and the West India colonies of the French and Dutch. The traffic was important and profitable, so that this Act, as well as those of 1660, 1661, and 1663, was largely evaded by false clearances, smuggling, and other means. For nearly 30 years little was done to check these evasions, but in 1761-63 stringent measures were taken to enforce all the navigation acts with unsparing rigor. The number of customs officers was increased, confiscation usually followed search, and appeal was even more costly than confiscation. These proceedings were strenuously opposed by the colonists and were among the most important causes of the discontent which led to the Revolution. Notwithstanding these and other restrictive acts, the ships and mariners of the Colonies increased in number until, at the breaking out of the Revolution, Massachusetts owned one seagoing vessel for every 100 of her inhabitants; while in New Hampshire, and what is now Maine, more people were engaged in shipbuilding and navigation than in agriculture.

During the War of the Revolution, though the poverty of the Colonies prevented them from building a large number of men-of-war, the extensive merchant fleet furnished a host of privateers, and these small craft captured or destroyed several times as many of the enemy's ships as did the war vessels. In none of the previous wars—with France or Spain—had the British merchant fleet suffered so greatly, the total captures (including vessels and cargoes destroyed) reaching £4,000,000. In 1781 the number of privateers was 449, mounting in all 6735 guns. They cruised in the Channel and in the Irish Sea and captured prizes almost in the entrance to the British ports, raising insurance and freight rates enormously and seriously interfering with all kinds of British commerce. On the other hand 900 American vessels, valued at £1,808,000, were captured previous to 1779.

The American merchant vessels of the pre-Revolutionary period were small, mostly of less than 100 tons. While somewhat slow and unhandy from a modern point of view, they were by no means the awkward, clumsy, and almost unseaworthy vessels of the *Mayflower's* day. The ridiculously high structures on the poop and fore-castle of ships of her date had been cut down until the form was not unlike that of sailing vessels of the present time. Sixty years before the outbreak of the war Capt. Andrew Robinson, of Gloucester, built a vessel of two masts with fore-and-aft sails on gaffs and booms, fitted with a jib boom and carrying a jib. This was a schooner, the most useful sailing type ever devised and now the most numerous. At first schooners were very small—50 tons or less—and when they began to grow in size the larger ones were fitted with yards on the fore-mast to carry a square topsail, or a topsail and topgallant sail. These vessels were called top-

sail schooners and were the craft which served so successfully as privateers and in the navy.

At the close of the Revolution the commerce of the States was well-nigh destroyed, and the poverty of the people made recovery slow. Nevertheless the immediate increase in shipping was considerable. Before the war Great Britain had seriously hampered the trade with her West India colonies; now she interdicted it. But the islands themselves suffered even more. Between 1780 and 1787 it is said that 15,000 slaves died there of starvation because American ships no longer brought dried fish and corn, while several of their own crops were reduced or destroyed by hurricanes.

As already noted, the cost of ship construction in America was considerably less than in England, and the building of ships for English purchasers had been an important industry. This also was cut off as a result of the war by the Orders in Council of the British government, which forbade the purchase or importation of American-built ships. The loss of the West India business drove the hardy navigators further afield. Trade with England was difficult for several years. A lucrative one with the south of Europe sprang up and was growing rapidly when the Barbary Powers discovered that many ships were to be found within striking distance that belonged to a young country which had no navy to protect its merchantmen. In their attack upon it they were openly supported by the British government and British shipowners. Lord Sheffield said that the Barbary pirates, preying on the defenseless commerce of the United States, were a blessing to Great Britain, while Franklin wrote that London merchants had publicly declared that if no Algiers existed it would pay them to build one. Congress was unable to protect the shipping against any foes and the vessels were, for a time, diverted elsewhere. Of those which persisted in trading with the south of Europe several were seized by the Barbary pirates and their crews forced into slavery.

Some adventurous mariners sailed for China, others doubled Cape Horn, seeking the isles of the Pacific or the western coast of the North American continent. Two of these in 1787 were the *Columbia* and *Lady Washington*, which made the first voyage to Oregon.

British ships endeavored to control the trade with the United States, and the British government continued so hostile that many of the States retaliated, exacting double duty on goods imported in British vessels and improvising various taxes of other sorts. But other States did not do this, and they got the business, transshipping the goods in their own coasting craft. In addition to interfering with legitimate trade by exorbitant tonnage and taxation charges, seizing and confiscating ships and cargoes upon flimsy charges, and forbidding trade with its Colonies, the British government authorized and encouraged rigorous search of American vessels and impressment of seamen. Little attention was paid to evidence of nationality if the need for men was urgent. Thousands of American citizens were thus seized and compelled to serve in the British navy.

The lack of support by the government and the difficulties and enemies to be met had held down American commerce, so that in 1789 the entire merchant tonnage registered for foreign trade was but 123,893. Among the first Acts

of the new Congress were several for the relief of shipping. This was largely brought about by urgent appeals from merchants and shipowners, especially those of Baltimore. Madison brought in the bill for the revenue tariff, and this provided for a reduction of 10 per cent of the duty on all goods imported in American ships. Specially heavy taxes were laid on tea imported in other than American bottoms, or even on tea imported in them if brought from any place in Europe. The tonnage bill laid a tax of six cents per ton on American-built ships if owned by Americans and 30 cents per ton if owned by foreigners, while foreign-built and foreign-owned ships paid 50 cents. All ships were in theory admitted to the coasting trade, but as foreign ships paid the tax every time they entered port, and American ships only paid it once a year, the prohibition was nearly absolute.

The effect of this protective legislation was instantaneous. The registered tonnage for foreign trade increased from 123,893 in 1789 to 346,254 in 1790; 363,110 in 1791; 411,438 in 1792; 367,734 in 1793; and 438,863 in 1794. The percentage of imports carried in American bottoms was: 1789, 17.5 per cent; 1790, 41; 1791, 58; 1792, 67; 1793, 82; 1794, 91. The drop in tonnage in 1793 was due in part to the depredations of the Dey of Algiers. To punish this pirate and prevent future aggressions of a similar nature Congress, upon Washington's urgent recommendation, authorized the building of six frigates and the establishment of a permanent naval force. But before these ships were completed a treaty was arranged with the Dey in which he was to receive about \$1,000,000 and other presents, including a frigate superior to any vessel ever under the United States flag up to that time. Congress, with careful economy, at once reduced the number of frigates to three and sold the material gathered for the others.

And now a new enemy appeared. The Revolution in France drove the former friends of the United States from power. The semblance of government under the Reign of Terror permitted all things. When the government of the United States refused to allow itself to be embroiled with England by permitting its territory to be used for unfriendly purposes, the attitude of the French changed. In the West Indies their picaroons (privateers) frequently seized American vessels without cause. After the diplomatic disputes began, these actions were not only permitted, but encouraged. Jealousy of the active mercantile navy of the United States, hatred of England and of their trade with the English colonies, restricted though it was, all combined to bring what remained of American West India trade to ruin. In 1794, 38 American vessels were seized upon the high seas by French warships and privateers and carried into French ports for confiscation. In the following years the conditions were as bad or worse. Protests were of no avail. The government under which the seizures took place was usually out of office by the time the protests were made and the documents in the cases submitted. Acting upon Washington's suggestions, Congress authorized the building of additional warships and the purchase of merchant vessels suitable for carrying an armament. In April, 1798, the Navy Department was organized, and in July, United States cruisers were directed to

capture any French vessels which might be found interfering with American commerce. After three years of fighting without the declaration of war, the French were so severely punished as to be glad to negotiate on any terms, and their harassment of American shipping ceased.

While still at war with France the United States escaped hostilities with the Dey of Algiers by giving way to his pretensions and by fortunate diplomatic negotiations with Turkey. Lack of a naval force for so many years, and the consequent failure to defend American citizens and property, led to a whole crop of small wars with the Barbary states. Gifts to Algiers and failure to punish the Dey for the imprisonment of American citizens and for depredations upon American commerce led the other Barbary Powers to adopt similar tactics. The Pasha of Tripoli declared war in May, 1801, but before the merchant marine had suffered to any degree a strong American squadron appeared before Tripoli, Tunis, and Algiers. Tripoli continued to make war, but Tunis and Algiers were quieted. Eventually the Tripolitans were thoroughly beaten and punished, and the Bey of Tunis overawed and compelled to sign a satisfactory treaty.

American dealings with England and France were equally unsatisfactory. The former continued to oppress the merchant marine by unfair taxes, impressment of seamen, and interference with trade. The latter did all she could to punish American ships for submitting to English methods. At this time all Europe was at war. The United States was the only neutral of importance, and the carrying trade of Europe was in its hands. Had the government stood firmly for its rights, much trouble might have been avoided. But President Jefferson was for peace at any price and merely protested against the imprisonment and impressment of thousands of American citizens and the confiscation of millions of dollars' worth of American ships and cargoes. England repeatedly refused to negotiate concerning or consider the question of impressment, although proof was presented that, in 1806-07, 6000 American seamen were serving against their will in the British navy.

Great Britain declared blockades of the French and other coasts and of the West India islands of her foes. France replied with declarations of blockade of the British Isles and colonies. These were only "paper" blockades, but served as an excuse to seize and confiscate American vessels. A British Order in Council forbade neutral vessels from carrying any goods from any port in the possession of France or her allies to any other similar port. Napoleon replied by his Milan Decree, directing the confiscation of all neutral ships which accepted British protection and paid British duties. In addition a British royal proclamation required royal officers to enforce the "right" of impressment against neutral merchant ships. Nor was this arrogance confined to merchant ships. In 1807 the British 50-gun ship *Leopard* held up the United States frigate *Chesapeake* and forcibly removed several of her crew.

To resist these aggressions, President Jefferson and the congressional majority adopted the policy of embargo. This is estimated to have cost the country \$100,000,000 in 15 months, nearly destroyed its commerce, and was an indirect cause of the War of 1812.

Notwithstanding all the dangers and difficulties that beset American commerce, it thrived because the prizes of success were large, so that the year 1810 saw the high-water mark of the foreign trade, the registered tonnage reaching 981,019. Madison was now President, and he was less inclined than Jefferson to submit to the condition of affairs. The temper of the people had also become aroused, and as the British continued their policy towards neutrals, war was becoming inevitable. British frigates lay outside of Sandy Hook, searching each merchant ship as she came out, impressing members of the crew, and seizing the vessel and cargo if she were bound to French ports in Europe or her colonies or to ports of her allies. Madison sent Commodore John Rodgers in the frigate *President* to watch this blockade of a neutral port. During the evening of May 16, 1811, Rodgers spoke a ship of war which, in the darkness, he took to be the British frigate *Guerrière*. When hailed the stranger returned an evasive reply and a round shot which lodged in the *President's* mainmast. The *President* replied by a broadside, and the fighting continued until the fire of the British ship was silenced. The stranger was then found to be the sloop of war *Little Belt*.

British aggressions were not checked by this incident. Seeing that war was imminent, President Madison laid a new embargo upon American ships and sent a warning to those abroad. The war which ensued was forced upon the United States and only resorted to when the conditions became intolerable. But the country was wretchedly unprepared. The work of the navy, however, raised its prestige enormously, and the privateers were not far behind in the brilliance of their achievements. They numbered 517 and carried 2893 guns. During the period of hostilities they captured or destroyed 1300 prizes valued at \$39,000,000. Being lightly gunned, heavily sparred, and of fine model, they were very fast and enormously efficient as commerce destroyers, but they were not simply vampires seeking dollars and safety. Many of them never refused combat on reasonably even terms either with privateers of the enemy or with his regular cruisers, and a number of the latter were among the prizes taken. As in the Revolution, they sought the coasts of England and made British commerce so precarious a business that marine insurance reached very high figures and British protests against the inefficiency of the navy in not preventing their operations were frequent and bitter. Their success, indeed, formed the principal reason why Great Britain was so willing the war should end.

In the Treaty of Ghent no mention was made of impressment, but it was never again attempted, so that the merchant service justly felt that it had fought for and won its own battle for sailors' rights.

During the war the registered tonnage in the foreign trade of course decreased very materially, and of the vessels registered many never went to sea. According to the Treasury reports the tonnage in 1815 was 854,295; in 1816, 800,760; in 1817, 804,851; in 1818, 589,954; in 1819, 581,230. The figures for 1815, 1816, and 1817 are incorrect and include many vessels missing since the war—lost, captured, sunk, broken up, or diverted to the coastwise trade; and the drop in each year, especially in 1818,

is due to their removal from the customhouse lists. The actual size of the mercantile fleet in these years is unknown, but there is every reason to believe that the tonnage of existing vessels was about 500,000 in 1815 and that it increased steadily up to the figures of 1818-19. The increase continued thereafter, though the total did not reach the high figures of 1810 until 30 years after the war closed. This was in no way discreditable to the energy of American merchants or sailors. Conditions had changed. The European wars were over, so that American ships were no longer harried, confiscated, or destroyed. On the other hand all maritime Europe was met in competition. Of course it took time for the foreign mercantile marines to rebuild their vessels and get possession of the trade they had lost. American statesmen, without duly considering the causes which had built up their great ocean fleet, or the reasons why it did not succumb when so bitterly assailed, firmly believed that the flourishing condition of the merchant carrying trade was due almost entirely to Yankee enterprise and ingenuity, so at the close of the war they offered to make treaties with all nations in which the preferential duties allowed upon goods imported in American ships would be given up provided similar import and export duties be not laid, or if laid be given up, by the other contracting Power. Great Britain seized the opportunity at once, but she was followed by Sweden and Algiers only. In the convention with Great Britain she stipulated that she should regulate the trade of her West Indian and Canadian colonies as she might desire. The removal of the discriminating duty was not immediately harmful. England was too busy readjusting and extending her trade in Europe, where she had less active opponents to contend with. The loss of Canadian and West Indian business was a blow and caused 80,000 tons of American shipping to be laid up. In a very short time Great Britain's purpose was evidently to exclude American vessels, in which she succeeded admirably, partly by direct and partly by indirect means. Congress soon realized the unfair conditions and passed an act forbidding the entrance of vessels of any nation from ports from which American vessels were excluded. This eventually brought Great Britain to improved terms, but in the meantime it caused enormous losses to all concerned. Another section of the Act of 1817 barred foreign vessels from the coasting trade. This was perhaps unnecessary, as tonnage duties had already effected this.

As the foreign carrying trade which did not enter American ports was reabsorbed by the vessels of the nations concerned, the American ships forced out of this traffic entered the coasting trade or the direct carriage between American and foreign ports. At the same time the total foreign commerce of the United States decreased quite steadily from 1816 to 1830, with a slight temporary rise in 1825. This decrease of business in the face of a growing tonnage gave an increasing surplus of American ships, so that the percentage of imports and exports carried in American bottoms naturally also increased until, in 1826, it reached 92.5. This high percentage of goods carried to and from the ports of the United States, and the apparent prosperity wrought by unusual and temporary conditions, blinded the eyes of American states-

men to the actual conditions. One of the causes of the maintenance of the high percentage was the establishment, immediately after the war, of numerous lines of sailing packets between the United States and Europe, especially England. The first and greatest of these was the celebrated Black Ball line, but the vessels in all the lines were of such excellence that, until the advent of steam in this trade, few foreign vessels were able to compete.

In 1828 the last vestige of protection was removed from the foreign trade. The Act of 1815 had offered the removal of tonnage duties in the direct trade with other countries. The Act of 1828 removed them also in the indirect trade. The reciprocity treaties, 30 or 40 in number, which were negotiated under these Acts are still in existence or their terms have been repeated in later conventions. The effect of the Act of 1828 was apparently instantaneous and reflected in the tonnage figures. In that year the registered tonnage was 757,998; in 1829, 592,859; in 1830, 537,563. But these figures are deceptive. In 1829 the sharp fall in registered tonnage was partly caused by the removal from registry of a considerable number of vessels no longer in existence, but whose names still appeared on the customhouse lists. Notwithstanding the removal of protection, the low cost of wooden shipbuilding in the United States and the high efficiency of operation gave the merchant fleet a fair degree of prosperity for some years longer. Probably 1836 may be regarded as the high-water mark, if registered tonnage, value of foreign commerce, and percentage carried in American bottoms are all considered. Foreign competition then began to make itself felt.

In the development of ocean trade and shipping a factor of the greatest importance had appeared some time before, and its effect was now rapidly increasing. This was steam. It received early and wide use on the coast and inland waters and diverted attention from deep-sea affairs. About 1830 railroads began operations. Steam on land and water was so profitably used in the internal development of the country, and the demand for capital for this purpose was so incessant, that each ocean-trade undertaking was dropped as soon as it became definitely unprofitable, no matter what its possibilities were thought to be.

Though the first steam vessel to cross the Atlantic, the *Savannah*, was an American ship, the first to undertake regular passages were the British steamers *Sirius* and *Great Western* in 1838. Up to this time the great American sailing-packet lines had a monopoly of the trade. Great Britain saw her opportunity, and when, late in 1838, Samuel Cunard made his final proposals to the British government they were accepted. The subsidy given to the Cunard Company was at first \$425,000 per annum, and this was about 25 per cent of its gross operating expenses. It was paid to insure the establishment of transatlantic steam navigation firmly in English hands, and it succeeded. As the service (originally planned for Halifax and Boston) expanded and extended to New York the subsidy was increased at intervals until it reached \$850,000. The American sailing packets continued to run, many of them until the Civil War, but in decreasing numbers and with diminishing profits. No American steamer line was started because Congress would grant no

subsidy, and a steamship line could not exist without it.

Mr. Wheelwright, American Consul at Guayaquil, realizing the importance of a steam line to the west coast of South America, endeavored to get a subsidy from Congress for it, but failed, although supported by American shipping merchants. He then went to England, met a cordial reception, secured an ample subsidy from the government, built a fleet of ships after the American model, and thus started the Pacific Steam Navigation Company, now one of the greatest of steamship companies and the greatest cause of the extension of British trade in South America. The trade of the West Indies, Spanish Main, and Brazil was such as to require a steamship line for its development. A subsidy was offered and the Royal Mail West India Company was organized. When its subsidy proved insufficient, the required service was reduced. Later increased service was called for and the subsidy augmented. France and other nations followed England's lead, the United States government alone standing out against subsidy.

Finally in 1845 Congress authorized the Postmaster-General to make contracts with the owners of American vessels for the regular transportation of the United States mails. The first contract was made with the Ocean Steamship Company for a service to Havre and Bremen. The company were to receive \$200,000 for 20 trips—about half as much as the amount paid the Cunard line for a much shorter route. Two very fine ships were built in 1847, the *Washington* (1640 tons) and the *Hermann* (1734 tons), and in 1850 these were followed by two of 2400 and 2850 tons. In 1847 the Black Ball line built a 2000-ton steamer, the *United States*, and she made several voyages; but without a subsidy she was a losing venture and was soon withdrawn and sold.

About the same time contracts were made for steamer lines to the West Indies, Isthmus of Panama, and, on the Pacific coast, from Panama north. The first of these was the Law line (afterward the Pacific Mail Steamship Company), which sent steamers to the Pacific and connected with its Atlantic branch at the Isthmus of Panama. Owing to the discovery of gold in California and the consequent increase of trade, this company became very prosperous and its fleet grew with rapidity. The transpacific service was not established until 1867 and was never really profitable.

In 1847 the Collins line of five steamers was projected. The original subsidy offered was small, but for increased service, larger vessels (the number reduced to four), and a higher rate of speed the subsidy was increased to \$33,000 per voyage or \$858,000 yearly for 26 voyages. These vessels, which began service in 1850, were much the largest, finest, and fastest vessels on the Atlantic. Such characteristics made them popular, but the cost and speed rendered them so expensive to run that the company made no money. However, they broke the British steamship monopoly, cut down the time of passage from 12 to less than 10 days, and reduced the cost of steamship freight between New York and Liverpool from \$37 to \$20 per ton. The company was unfortunate. The *Arctic* was sunk in collision, and the *Pacific* was lost at sea. A new and larger steamer was built in 1855, but in the same year Congress repealed

the Mail Subsidy Act, and the company necessarily suspended operations.

The famous clipper ship (q.v.) was the natural result of the introduction of steam into ocean navigation. It was the last expiring effort of the sailing ship to hold its own with the steamer on long voyages by nearly equaling its speed and at the same time affording a lower freight rate. The ship which has the reputation of being the first of the type was the *Rainbow*, built at Baltimore in 1843. The necessity for speed to compete with steam in the transatlantic trade; the desirability of speed as a saver of time in the long voyage to China; the discovery of gold in California, with the corresponding increase of trade between the east and west coasts of the country; and lastly the European demand for transportation during the Crimean War all combined to popularize the clipper, extend for the moment the career of the sailing ship, and also to sustain for several years (and even increase) the tonnage of American foreign trade.

As the various supporting factors of this tonnage were reduced or extinguished the direct opposition increased. Iron began to supersede wood for steam vessels, and the shipbuilding yards and ironworks of the country were not prepared to build hulls of that material at a rate to compete with British establishments. The iron-hulled freight steamer then began to supplant the wooden sailing ship. The Civil War was now imminent, and all that sectional hatred and bias could do to injure the property that was almost wholly Northern was done. Nevertheless the registered tonnage, including the deep-sea fisheries (182,106), whale fishery (145,734), and a large amount of small craft operating along the borders, reached 2,496,894 in 1861. This, on paper, was its culminating figure. The conditions already referred to, the operations of the Southern cruisers, and the interest of capital in other undertakings caused it to drop steadily until 1898, when it was only 726,213—of which less than 500,000 tons were effectively employed away from the coast, the remainder consisting of barges, small craft, superannuated vessels (mostly laid up), vessels sold or lost but not yet erased from the list, and others registered for foreign trade but chiefly engaged in coasting commerce. Since 1898 there has been a material gain, the tonnage on Jan. 1, 1915, being about 1,300,000, of which 300,000 to 400,000 tons were not effectively engaged. Of the total, at least 250,000 tons represented ships transferred to the American flag since the beginning of the great war.

The prospect for the increase of registered shipping (i.e., shipping in the foreign trade—coasting vessels are *enrolled*) and the maintenance of it in normal times is not bright. Even if subsidies are resorted to, they will affect only mail and passenger steamers. The great mass of freight will still be carried by foreign freighters until American vessels of the same class can be built more cheaply and operated more cheaply. The difference in cost of building is much less than it was a few years ago, and by adapting construction processes to American labor conditions (as has been done in locomotive building) the excess may disappear or even appear on the other side of the ledger. But the difference in operating cost is not only the most serious, but for much of it there is no cure in sight—at least for steam vessels. It is

due to higher wages, more officers, larger crews, and many restrictions (without compensation) laid upon operating by unfavorable legislation. A very serious factor is the insurance, which is chiefly effected through European societies, whose interests are bound up with rival shipowners and merchants. This alone, in some trades, would be sufficient to render business unprofitable, even were other things equal. Under present conditions the operation of a 5000-ton freight steamer costs about \$15,000 a year more under the American flag than under the British, German, or Norwegian. This is about 5 per cent of the cost of the ship and easily measures the difference between prosperity and unprofitableness. The Seaman's Act, approved by the President on Feb. 28, 1915, will add, when in full effect, still further to the expenses and difficulties of operating American ships by requirements concerning the payment of the crew, their ability to speak English, their qualifications as to experience at sea, etc. Another clause removes all penalties for desertion except forfeiture of part of the wages. In view of this Act, the Pacific Mail Steamship Company has announced the discontinuance of its foreign service, and other shipowners in the foreign trade are preparing to transfer their vessels to other flags. Some of the provisions of this and similar acts are desirable and are in line with modern ideas as to health, comfort, and safety; but as few of them are required in foreign services, and as there are no compensatory features to reimburse the shipowner, they make foreign trade under the American flag more difficult than heretofore.

One of the means of gauging the adequacy of the registered shipping is to determine the proportion of foreign commerce carried in native bottoms. In 1826, 92.5 per cent of the imports and exports of the United States was carried in American ships; in 1913, 10.2 per cent; and it has been (1910) as low as 8.75. This of course takes no account of traffic between ports of foreign nations, if such trade exists, as it did prior to 1860 and especially in the early years of the nineteenth century, when a large part of the deep-sea tonnage was so engaged.

In the summer of 1914, soon after the outbreak of war, the lack of sufficient shipping in the transatlantic trade was severely felt and caused a sharp rise in freight rates. As one means of relieving the difficulty a bill was passed in August, 1914, modifying section 5 of the Panama Canal Act and permitting the registry of staunch and seaworthy foreign-built vessels of any age, providing they were wholly owned by American citizens or corporations. The vessels registered under this Act before Jan. 1, 1915, had a total tonnage of nearly 300,000 and formed a notable addition to the foreign trade fleet; but whether the gain would be permanent would depend upon future conditions.

A minor but still important factor in the development of freight traffic in American bottoms is the new banking law of the United States which permits branch banks abroad. The lack of suitable banking facilities in foreign ports has always militated against American interests, shipping or other.

While the foreign shipping trade has, in the course of years, deteriorated until it is almost negligible, the completely protected coasting fleet has grown to enormous proportions, and the opening of the Panama Canal is likely still further to stimulate it. In 1789, while the

coasting trade was unprotected, it had a hard struggle with British vessels for existence. In that year, as already mentioned, a tax of 6 cents per ton was placed on American ships and 50 cents per ton on those of foreign nations. Moreover, the foreigner paid the tax each time he entered port; the American paid once a year. This was practical exclusion. Thus relieved from foreign competition, the coasting trade increased rapidly from 68,607 tons in 1789 to 103,775 in 1790; 164,796 in 1795; 245,295 in 1800; 301,366 in 1805; 371,114 in 1810; and 435,067 in 1815. The Navigation Act of 1817 prohibited foreign vessels from engaging in the coastwise trade, and this prohibition has never been removed.

The advent of steam changed conditions in the coastwise trade much faster than in the foreign, for the very obvious reason that the early forms of marine engines and propelling apparatus were unfit for application to seagoing ships. But steamboats in rivers and protected waters increased rapidly; by 1823 there were 300 of them on American rivers, bays, sounds, and lakes. About this time seagoing coasting steamers, fit to stand moderate weather at sea, were beginning to run on regular service.

Until quite recently the heavy coastwise traffic was largely carried in sailing vessels, and for this purpose the schooner was found most suitable. As the traffic increased in volume the schooners increased in size and number of masts, culminating in the seven masters of to-day, though schooners of three and four masts are and have been the most common. The advantages of the schooner are the ability to lie close to the wind and work through narrow channels, the ease of working the sails so that few men are necessary to handle them, and the reduced cost of rigging, sails, and equipment. Of late years sailing vessels of all kinds are falling into disuse. The larger craft are being displaced by steel or heavy wooden barges, which are towed in strings of two or more by powerful ocean-going tugs. Even small sailing craft and fishing boats are now generally fitted with auxiliary motor engines. The combination of sail and auxiliary, internal-combustion, heavy-oil engines of the Diesel type may be a stage in the development of ocean transportation, for it seems apparent that in slow freight vessels this is the cheapest form of propulsion and ocean freight carriage, and the speed ought to approximate that of the steam tramp.

The Civil War did not seriously interfere with the development of the coasting trade except in the South. After the war the trade was somewhat affected by the diversion of capital and freight to the railways, and the total tonnage decreased slowly until 1878, when it had fallen to 2,444,801 tons. From that time to the present the increase has been continuous and rapid, reaching 6,818,363 tons on June 30, 1914, the last date for which figures are yet available. Of this total 2,882,922 tons were in the Great Lakes and 141,436 tons on Western rivers.

The first vessel built above Niagara Falls was the *Griffin*, a little craft of 45 tons, launched by La Salle in 1679; but it was another hundred years before anything more than the canoes and boats of trappers and explorers were to be found there. As the fur trade grew in importance small brigs were built to carry furs and supplies. The first American vessel on the upper

lakes was the *Washington*, said to have been launched at Erie, Pa., in 1797. After the War of 1812 the development of the Northwest brought about a corresponding increase of shipping on these fresh-water seas. At first this

large increase in freight tonnage. The competition of the railways checked this somewhat in later years, but their principal effect was in the lake passenger business, which was nearly destroyed and has only recently revived.

* Exclusive of packing houses and canneries.

was largely for the transportation of passengers and supplies. The first steamer, *Walk-in-the-Water*, was completed in 1819. By 1830, regular steamer lines ran between Buffalo and Chicago and had gone as far as Detroit a few years before.

In 1833 the Welland Canal was completed, with locks 110 feet long, 22 feet wide, and 8½ feet deep. As small canals have always done, this tended to make all vessels using it take on the general shape of canal boats, to the detriment of their safety, speed, and other qualities.

In 1855 the first canal for large craft was built by the State of Michigan around the St. Mary's River rapids (Sault Ste. Marie) with a depth of 11½ feet. In the succeeding year 106,296 tons of freight passed through it. The growth of traffic soon demanded new locks, which were finished in 1881; during the next year 2117 steamers of 2,092,757 tons used them. Minnesota iron ore now began to be of importance and added greatly to the tonnage. In 1895 a Canadian canal around the rapids was opened for traffic, and in 1896 the Poe lock on

* Includes tonnage on Great Lakes and of inshore fisheries.

† Figures for these years doubtful; are probably not very far wrong.

‡ Correct figures never determined; these are at least 30 per cent too large. Explanation in text.

\$ Estimated.

The shallows near Detroit caused the larger lake boats to be broad of beam and light of draft until the government improved the channel.

In 1842-43 the first grain elevator was built at Buffalo, and soon the grain traffic caused a

the American side was finished, and in 1914 the Davis lock, also on the American side, with virtually a separate canal, was opened to commerce. The depth through the canals, locks, and river channels is approximately 20 feet, but

is gradually being increased by dredging and other work, the new American lock having 24½ feet of water upon its mitre sill with a depth of 25 feet in the canal approaching it both above and below. In 1914, 23,795 vessels of 57,989,715 net tons' register passed through the American and Canadian canals. Owing to the Great European War the iron-ore trade fell off 16,695,888 tons in 1914, and the total trade through the canals was 31 per cent less in 1914 than in 1913. The net tonnage of vessels passing through the American and Canadian canals for 1913 was 57,989,715, and for the Suez Canal in the same year, 19,758,040.

Since 1900 the increase of tonnage of vessels plying on the Great Lakes has nearly doubled. The size of the vessels has steadily grown, many of them being over 7000 tons, and one is over 8000. A large amount of tonnage is in steel barges, several of which are hauled in a single tow by a large cargo carrier or tug. Much of the success of the Lake freight trade has been due to the high efficiency of the design and construction of the vessels and to the novel, cheap, and rapid methods of loading and discharging cargo, which effect the handling of heavy bulk freight such as grain, coal, and iron ore at hitherto unprecedented costs.

One of the important branches of the merchant marine was the whaling industry. Whaling in small boats was practiced by the Colonies as early as 1640, but it was not until near the close of the seventeenth century that whale ships were sent out. In 1775, 150 Nantucket whalers were at sea, but they were mostly of very small tonnage. Most of the records previous to 1800 are incomplete and not very reliable. In that year the reported tonnage was 3466, and the greatest in any year before the outbreak of war was in 1803, when it reached 12,390. In 1817 it was 5224; in 1818, 16,750; and in 1819, 32,386. From that time until 1858 it increased with more or less regularity. The British have always had a good many whaling ships, many of which were in the South Pacific in 1812. Most of the American whalers in that vicinity had been captured by the British letters of marque when Porter appeared in the *Essex*. Before his glorious defeat at Valparaiso, Porter had captured every letter of marque and British whale ship west of Cape Horn and had liberated most of their American prizes, and his success gave such a setback to the British whaling industry in the Pacific that it was long before it recovered. The whaling trade continued to furnish a large part of the deep-sea fleet until quite recent years, its eventual decadence being almost wholly due to the decrease in numbers of the whale. At the height of its success, from 1836 to 1861, whaling was almost exclusively an American industry. In 1842, out of the world's total of 882 whale ships, 652 were American. In 1858 the tonnage engaged was 198,594 and the number of men employed about 25,000.

The deep-sea fisheries have always been an important American occupation, although they have now dwindled to less than one-fourth their former size, measured in tonnage. In 1614 John Smith set up a fishing station at Pemaquid, Me., where his men caught and cured 1200 quintals of fish that sold in Spain for \$5 a quintal. During all the early days of the New England Colonies their fisheries were most important to them, affording the products best susceptible of being turned into ready cash.

They were therefore carefully fostered and their rights jealously guarded. To the deep-sea fisheries the country was indebted for a very large proportion of the sailors of the Revolution and even of the War of 1812.

These fisheries were almost destroyed by the Revolution. After its close the Treaty of 1783 gave to American fishermen the same rights of fishing and curing fish along the Canadian coast as when British subjects. But the industry was paralyzed. A bounty was offered and the fisheries revived. The War of 1812 again ruined them, but additional bounties were given in 1819 and, notwithstanding opposition and unfair treatment by both England and Canada, it increased more or less steadily until 1862 (tonnage in that year, 193,459), although the bounty laws were repealed in 1858. From 1862 to the present the tonnage engaged has slowly decreased, until in 1913 it was only 41,762, employing 1623 vessels and 22,157 men. The value of the catch was \$15,100,000.

The other fisheries have had less to do with the merchant marine proper. The latest statistics in regard to all fisheries are given in the tables on page 428.

Bibliography. The best general survey of the early period is in A. T. Mahan, *Sea Power in its Relations to the War of 1812* (2 vols., Boston, 1905), and the most useful repository of facts for the entire period is Hans Keiler, *American Shipping: Its History and Economic Conditions* (Jena, 1913), which contains a bibliography. Consult also: David MacPherson, *Annals of Commerce* (4 vols., London, 1905); *Report of the Merchant Marine Commission* (Washington, 1905); G. W. Allen, *Our Navy and the Barbary Corsairs* (Boston, 1905); Royal Meeker, *History of Shipping Subsidies* (New York, 1905); Edward Channing, *The Jeffersonian System* (ib., 1906); G. L. Beer, *British Colonial Policy, 1754-1765* (ib., 1907); G. W. Allen, *Our Naval War with France* (Boston, 1909); A. H. Clark, *The Clipper Ship Era* (New York, 1910); W. L. Marvin, *The American Merchant Marine* (ib., 1910); W. D. Reninger, *Government Policy in Aid of American Shipbuilding* (Philadelphia, 1911); B. O. Hough, *Ocean Traffic and Trade* (Chicago, 1914); *Statistical Abstract of the United States Department of Commerce* (Washington, annually). See COMMERCE; NAVIGATION LAWS; SHIP; SHIPPING; SHIPPING SUBSIDIES; UNITED STATES.

MERCHANT OF VENICE, THE. A comedy by Shakespeare, produced probably in 1597, printed in 1600. The earliest version was probably that by Henslowe, in 1594, under the title *The Venesyon Comedy*. The incidents of the play are drawn from many sources. The story of the pound of flesh is very ancient; Shakespeare took the story of Bassanio no doubt from the counterpart, in the *Adventures of Giannetto* in Fiorentino's *Il Pecorone*, written in 1378, but printed in 1558; and possibly from a similar tale in the *Gesta Romanorum*, which contained as well the story of the choice of three caskets, a popular mediæval tale. He may have been indebted to the lost play, *The Jew*, mentioned by S. Gosson in his *School of Abuse*, 1579; but certainly was influenced by Marlowe's *Jew of Malta*. The character of Shylock was drawn in part at least from *The Orator*, by Silvan; while the story of Antonio and Shylock was foreshadowed in *Three Ladies of London*, by Robert Wilson, 1584.

MERCHANTS, CUSTOM OF. See **LAW MERCHANT.**

MERCHANTS ADVENTURERS. An English company organized in late mediæval times for carrying on foreign trade. Its constitution was that of a regulated company (q.v.), any one having a right to join in the trade upon payment of a fine and agreement to submit to the regulations of the company. The date of its incorporation is not known, but privileges were granted to it by the Count of Flanders as early as the fourteenth century. The principal business of the company was the export of cloth; and it exacted regular contributions from all persons who exported cloth to countries covered by its privileges. In the sixteenth century the chief work in extending English foreign trade was performed by this company. When the Portuguese made Antwerp the depot for Oriental wares the Merchants Adventurers grew rapidly in wealth, since their goods could find a ready sale for the Eastern trade. In the same century the company began a long war with the traders of the Hanseatic League (q.v.), who were infringing upon their monopoly of the export of woolen goods. The Hanseatic traders were at first protected by the crown, but finally were driven from England by a decree of Queen Elizabeth. With the siege and capture of Antwerp by the Spaniards (1584-85) the Merchants Adventurers had to find new centres for carrying on their foreign trade, and finally settled in Hamburg, becoming known as the Hamburg Company. Much of the historical importance of the Merchants Adventurers lies in the fact that their organization served as a model for the great foreign trading companies of the sixteenth and seventeenth centuries. See **REGULATED COMPANIES.**

Consult, for a brief account, "Adventurers, Merchants," in R. H. I. Palgrave, *Dictionary of Political Economy*, vol. i (New York, 1910). A more extended discussion will be found in Lingelbach, *The Merchant Adventurers of England* (Philadelphia, 1902).

MERCHANTS' COURTS. Certain courts which arose out of the guild merchant, by the practice of the guild brethren assuming to do justice at their "morning speeches," or periodical meetings of the society. They first assumed to decide cases of inheritance and succession to membership in the guild, such membership being—as to-day a seat on a stock exchange—regarded as an object of ownership. Later they assumed jurisdiction over actions of debt, covenant, trespass, and such other matters as they could enforce by their decrees. These judicial functions of the guild merchant became well established, in some cases at least, as early as the twelfth or thirteenth century; and the merchants' courts exercised a large influence upon the economic and corporate growth of the municipalities where they existed both in England and on the Continent. These old courts disappeared with the disappearance of the guild merchant, which was superseded by the aggregate of the crafts, and their jurisdiction was taken over by the ordinary courts or by special merchants' courts in London and other trade centres, but the business customs that they recognized and helped to establish became the source of a large part of the mercantile law of to-day. See **LAW MERCHANT**, and consult the authorities there referred to.

MERCHANT'S TALE, THE. One of Chaucer's Canterbury tales. The story is the be-

trayal of an old husband by a young wife. Tyrwhitt thinks it was taken from a Latin fable by Adolphe of 1315, but the story with the incident of the pear tree is found in many sources. It forms the seventh of the "Fables of Alfonse," added by Caxton to his edition of Æsop, 1484, and is found in "Behar Damish," composed in 1650, though the story, evidently of Oriental origin, is far older. Boccaccio and Chaucer may have drawn it from the "Commedia Lydiæ." An account of these sources is found in the Chaucer Society publications under "Origins and Analogues" of the tales. Pope used the tale as a basis for his "January and May."

MERCIA, mēr'shā. An Anglo-Saxon kingdom which at first occupied the upper basin of the river Trent and later conquered most of the territory between the Humber and the Thames. It owed its origin to the fusion of many smaller states. The name Mercians signifies "men of the march," for they were settled along the moorlands, which for centuries remained the borderland between Angle and Welshman. The Kingdom was of little importance until the accession of Penda, c.626, who rapidly attained a supremacy over the other kingdoms after his victory over the powerful Edwin (q.v.), the Deiran King, at Hatfield (or Heathfield) in 633. Penda, however, was defeated c.655 and slain by the King of Northumberland at Winwaed, and for a time Mercian supremacy came to an end. It recovered gradually under Wulfhere (658-675), who was the first Christian King of Mercia, and attained its highest development in the eighth century, especially under Æthelbald (716-757) and Offa (757-796). After the death of the latter the Kingdom declined, and in 918 it was annexed to Wessex. Consult Green, *The Making of England* (New York, 1882). See **HEPTARCHY.**

MERCIÉ, mār'syá', ANTONIN (1845-1916). A French sculptor and painter, born at Toulouse. He was a pupil of Jouffroy and Falguière and won the Prix de Rome in 1868. His "David Vainqueur" (1872) secured him admission to the Legion of Honor, and the fine patriotic group "Gloria Victis" (1874), now in the court of the Hôtel de Ville, Paris, established his reputation. Other celebrated works are the high-relief "The Genius of the Arts," for the so-called Guichet du Louvre; the group "Quand Même" (1882), at Belfort (replica in the Tuileries Gardens); the statues of Meissonnier (Louvre Gardens) and William Tell (Lausanne); the tombs of Cabanel and Michelet in Père-Lachaise and of Louis Philippe in Dreux Cathedral; the figure "Remembrance" in the Luxembourg; the monument to Gounod for the Parc Monceau; Lee in Washington and Francis Scott Key in Baltimore. His best work combines technical skill, feeling, and a certain grandeur of conception, with rhythm, movement, and delicacy of sentiment. His busts are excellent, and he also achieved success as a painter in such canvases as "Venus" and "Sleeping Nymph" (Luxembourg). He was elected a member of the Institute in 1891.

MERCIER, mār'syá', DESIRÉ JOSEPH, CARDINAL (1851-). A Belgian prelate of the Roman Catholic church. He was born at Braine-l'Alleud, Belgium; was educated at Malines and at Paris and Leipzig; became a priest in 1874; then taught philosophy at the lesser seminary in Malines from 1877 to 1882, when he was appointed to the chair in Aquinas' philosophy founded at Rome by Leo XIII. In 1906 he was

consecrated Archbishop of Malines and primate of Belgium, and in April, 1907, he was made Cardinal. He founded in 1894 and edited until 1906 the *Revue Néoscholastique*, and wrote in a scholastic manner on metaphysics, philosophy, and psychology, several of his works being translated into English, German, Italian, Polish, Spanish, etc. His most important book was *Les origines de la psychologie contemporaine* (1897). His position as Catholic primate of the country brought him into particular notice when Belgium was invaded in 1914 by the Germans. He was forbidden to leave the episcopal residence, and his Christmas pastoral letter, summing up Belgium's losses, preaching patriotism, praising England and blaming Germany, and advising his flock that they need not recognize German authority, was suppressed and the printer fined. For this letter consult the *New York Times*, Jan. 22, 1915.

MERCIER, HONORÉ (1840-94). A Canadian political leader. He was born at Ste. Athanase, Quebec; was educated at the Jesuit College, Montreal; studied law, and in 1865 was admitted to the Quebec bar. In 1862-64, as editor of *Le Courrier de Saint-Hyacinthe*, he for some time advocated Liberal principles, but he had no sympathy with the cause of Confederation, which in his opinion threatened the political security of French Canadians. He was in 1871 one of the founders of the Quebec Nationalists, organized for the aggressive assertion of French-Canadian racial and religious rights. He became Liberal member for Rouville in the House of Commons (1872-74); but in 1879 he entered Quebec politics, having been appointed Solicitor-General in the provincial administration. Though a Liberal, he later based his policy mainly upon an alliance with the Catholic hierarchy, and was ready to strengthen his party following by accessions from the Conservative and Nationalist ranks. The result was seen after he was elected in 1883 as Liberal leader in Quebec. In 1885 the execution of Louis Riel (q.v.), who had fomented a second rebellion in the Canadian Northwest, greatly excited the French Canadians, who looked upon Riel as a martyr; and Mercier gathered under his leadership all the disaffected sympathizers with the cause of the rebel leader. In 1886 he was successful in the provincial elections and in 1887 became Premier. For four years his administration was the storm centre of both Quebec and Dominion politics. In 1887 he passed a law incorporating the Jesuits, and in 1888 he enacted a measure compensating them for the confiscation of their estates. An agitation for the federal disallowance of this measure became widespread, but the vote in the House of Commons sustained Mercier as acting within provincial rights. In 1890 he was successful in the elections, in 1891 visited Europe, and the honor of Count of the Roman Empire was conferred upon him by Pope Leo XIII. After his return the same year charges of corruption in connection with the Baie de Chaleur Railway scandal were brought against him, and he was dismissed by the Lieutenant Governor. Brought to trial by the succeeding administration, he was found not guilty; but his political importance was lost and his health failed.

MERCIER, LOUIS CHARLES ANTOINE (1744-1812). A French engineer, born at Melun. He entered the French naval service about 1760, but at the outbreak of the American Revolution got permission to join the Patriot forces as a volun-

teer, and served under d'Estaing and Lafayette. At the close of the war he reentered the French service, but during the Reign of Terror fled to Louisiana, where in 1803 Napoleon employed him to draw up plans for the protection of the Gulf coast. Later Mercier explored the country as far as Oregon and California. In 1808 he returned to France, where he published *Mémoire sur les vapeurs de l'atmosphère le long du cours du Mississippi* (1808); *Carte du bassin du Mississippi* (1808); *Système hydrographique de la Louisiane* (1809); *Carte du delta du Mississippi* (1810); *Etudes topographiques, géographiques, hydrographiques, géologiques et géodésiques sur la Louisiane* (1811); *Tableau du climat de la Louisiane, et de son influence sur les Européens et les Créoles* (1812).

MERCIER, LOUIS SÉBASTIEN (1740-1814). A French author, born in Paris. At first he wrote novels, some of which, especially *L'Homme sauvage* (1767), were widely read. After having written some dramas, which were severely criticized, he published an *Essai sur l'art dramatique* (1773), in which he contended that the dramas of Racine and Corneille had ceased to be of any interest to the French theatre. Mercier wished to see Diderot's theories realized on the boards; he wished to see life portrayed more faithfully. It was after a prolonged struggle that Mercier had the satisfaction of seeing his dramas, *L'Habitant de la Guadeloupe*, *La brouette du vinaigrier*, and *Le déserteur*, played on the Parisian stage, where they were enthusiastically received. In his essay *L'An 2440, rêve s'il fut jamais*, published in 1770, he sketches out a programme of political and social reforms. His *Tableau de Paris* (1781), in which the vices and lawlessness of the Parisian aristocracy are described, gave so much offense that he was compelled to leave France. His other books include: *Le nouveau Paris* (1800) and *Histoire de France depuis Clovis jusqu'au règne de Louis XVI* (1802). Mercier was a member of the Convention, in which he voted for the death of Louis XVI, and of the Council of Five Hundred.

MERCIER DE LA RIVIÈRE, mâr'syâ' de là rê'vyâr', PAUL PIERRE (1720-1794). A French economist. In 1758 he became Intendant of Martinique, where he incurred the hostility of the French trading and shipping interests through a liberal administration of the colonial commercial regulations. He returned to France in 1764 and published *L'Ordre naturel et essentiel des sociétés politiques*, pronounced by Adam Smith to be the best exposition of the doctrines of the Physiocrats. Economists of the present day see in this work little more than a loose, popular exposition of the doctrines of Quesnay and Mirabeau. At the time of its publication, however, it created a sensation and procured for its author an invitation to the court of Catharine II of Russia. Mercier's audience with Catharine proved a dismal failure; his pedantry and the abstract character of his political doctrines were utterly repellant to the Russian monarch. Upon his return to France Mercier collaborated with Quesnay, Du Pont, and other members of the school in an active propaganda for economic liberalism. He published numerous articles in the *Ephemerides du Citoyen*, and several books, none of which attracted popular attention or merited scientific consideration.

MERCK, mërck, JOHANN HEINRICH (1741-91). A German author and critic, born at Darmstadt and educated at Giessen. From 1768 he

lived in his native town as an army paymaster. His influence on German literature was the result of his critical ability, but chiefly through his early encouragement and intelligent criticism of Goethe, his intimate friendship with Herder, Wieland, Forster, and Lichtenberg, and the prominent part he took in Wieland's *Merkur*, the *Frankfurter gelehrte Anzeigen*, and Nicolai's *Allgemeine deutsche Bibliothek*. In business ventures and in his domestic relations he was unfortunate, his mind became affected, and in 1791 he committed suicide. His correspondence, printed at Darmstadt (1835-38) and at Leipzig (1848), and a selection from his critiques, edited by Stahr (1840), alone remain as evidences of his literary ability. Selections from his works and letters were published in two volumes (Leipzig, 1909). Consult Zimmermann, *Johann Heinrich Merck* (Frankfort, 1871), and Leo Grünstein, *Silhouetten aus der Goethezeit* (Vienna, 1909).

MERCŒUR, mër'kêr', PHILIPPE EMMANUEL DE LORRAINE, DUKE DE (1558-1602). A soldier and Roman Catholic leader in the French "wars of religion." He was the head of the younger branch of the house of Lorraine and cousin to the Guises. King Henry III and Mercœur married sisters, and the King made him Governor of Brittany (1582). The appointment was imprudent, for Mercœur's wife was descended from the ancient dukes of Brittany and Brittany was but newly attached to the French crown. After the murder of the Duke of Guise (1588) Mercœur passed into revolt, declared for the League, and soon proclaimed himself Governor of Brittany. The location and local patriotism of Brittany made it an important factor in the clash of international ambitions. The province was coveted by Philip II as a most valuable stopping place on the voyage from Spain to the Netherlands. For this and other reasons Henry IV was anxious to regain it, and Elizabeth of England was desirous of helping him. Hence, in the decade 1588-98, Spanish troops coöperated suspiciously and half-heartedly with Mercœur, while English troops aided Henry IV's commanders against the Duke and the Spaniards. Mercœur enjoyed the general support of the Bretons and clung to his place until Henry IV marched against him in person in 1598. Then, with the support of Gabrielle d'Estrées, Henry IV's mistress, he made most profitable terms, securing, according to Sully, an indemnity of 4,000,000 livres. His only daughter and heir was betrothed, and ultimately married, to the Duke of Vendôme, a son of Henry IV and Gabrielle, and to him was transferred the government of Brittany. Mercœur subsequently fought the Turks in Hungary, and died, on the way back, at Nuremberg. Consult: L. Grégoire, *La Ligue en Bretagne* (Nantes, 1856); Gaston de Carné, *Documents sur la Ligue en Bretagne: correspondance du duc de Mercœur* (2 vols., Rennes, 1900); Ernest Lavisse, *Histoire de France*, vol. vi, part i (Paris, 1904).

MERCUR, JAMES (1842-96). An American military engineer and writer. He was born at Towanda, Pa., and, after graduation at West Point, was promoted second lieutenant in the engineers' corps (1866) and first lieutenant (1867). He later became assistant engineer on the survey of the northern and northwestern lakes. In 1867-70 he was assistant professor of natural and experimental philosophy at West Point, and later was principal assistant in the same department (1870-72). He engaged in dif-

ferent river and harbor improvements, notably at Hell Gate (1876-81). He was promoted captain in 1875, was recorder of the board of engineers in connection with the works of Charleston harbor (1878-81), and supervised government engineering and survey work in North and South Carolina, Virginia, and New York (1881-84). In the latter year he was appointed professor of civil and military engineering at West Point, which position he held until his death. He revised and enlarged the treatise by Prof. Dennis Hart Mahan (q.v.) on *Permanent Fortification* (1887) and wrote *Elements of the Art of War* (1888); *Military Mines, Blasting, and Demolitions* (1892); *Attack of Fortified Places* (1895).

MERCURIC CHLORIDE, or CORROSIVE SUBLIMATE, HgCl₂. One of the two known compounds of mercury and chlorine, the other, which contains a smaller proportion of chlorine, being described under CALOMEL. Mercuric chloride may be prepared by heating a mixture of mercuric sulphate (free from mercurous salt) and common salt with a small percentage of manganese dioxide, and collecting the sublimate in a suitable receiver. The manganese dioxide remains behind unchanged, its presence being desirable only in order to prevent the formation of calomel along with mercuric chloride. Pure mercuric chloride has a specific gravity of about 5.4; it melts at 288° C. (550° F.) and the liquid boils at 303° C. (577° F.). Corrosive sublimate is moderately and very slowly soluble in water, but is quite soluble in ordinary alcohol, which dissolves about one-third of its weight of the sublimate. With the chlorides of the alkali metals, with ammonium chloride, and with many other salts mercuric chloride forms double salts. With alcohols, ketones, aromatic nitro compounds, and especially with the alkaloids, it forms double compounds. Mercuric chloride is a violent poison, the symptoms of acute poisoning being painful gastrointestinal irritation, vomiting, and diarrhea. A moderate amount of white of egg forms a good antidote. Besides, milk and flour should be given, and vomiting should be induced by mustard and lukewarm water, or by irritating the fauces. In small quantities mercuric chloride is administered internally, either by the mouth or hypodermatically, as a remedy for syphilis, mercury salts being especially valuable in the primary and secondary stages of the disease. Externally mercuric chloride is extensively used as an antiseptic and as an antiparasitic, the maximum strength of solutions thus employed being about one part of the sublimate to one thousand parts of water. It is one of the most powerful antiseptics known.

MERCURIC CYANIDE. See HYDROCYANIC ACID.

MERCUROUS CHLORIDE. See CALOMEL.

MERCURY (Lat. *Mercurius*, Gk. *Ἑρμῆας*, *Hermēas*, hence *Ἑρμῆς*, *Hermēs*, Doric *Ἑρμᾶς*, *Hermās*). The Latin name for one of the Olympian divinities of Greece and Rome, known to the Greeks as *Hermes*.

Greece. According to the common Greek legend *Hermes* was the son of *Zeus* and *Maia*, who bore him in a cave on Mount *Cyllene* in *Arcadia*. He was widely worshiped in Greece proper and on the Greek islands, in festivals known as *Hermæa*. Immediately after his birth he went forth and stole the cattle of *Apollo* (then serving King *Admetus*, q.v., on earth), dragging them backward to his cave. When accused he

stoutly denied the theft even before Zeus, and when convicted succeeded in pacifying his brother by the gift of the lyre, which he had been led to invent on the day of his birth from discovering outside his natal cave a tortoise shell in which only the dried sinews remained. In the *Odyssey* and later Hermes is the messenger of the gods—their herald (ἑρμῆς), of supernatural swiftness, often with wings on his shoes and cap, and carrying a magic rod (the later caduceus, q.v.). With this rod he charms men to sleep and wakes them; he is thus able to conduct whom he will wherever he will, unseen of men. He also appears in the latest stages of epic poetry and throughout classical antiquity as Hermes Psychopompos, who conducts the souls of the dead to the lower world, where he intrusts them to Charon, who ferries them over the Styx. He was also the herdsman's god, being especially worshipped to secure increase of the flocks. And from this function perhaps arises connection with the ram and the calf, both of which are associated with him in cult and art. Travelers looked to him for guidance and help on their journeys, and traders venerated him as one who could increase their gains, for he was the god of good luck and "windfalls." He was also the patron of thieves; perhaps originally of cattle raiders. He was also honored in the palestra and gymnasium, where his statues were erected, as the guardian and favorer of manly sports. In later times he appears frequently as a god of eloquence and persuasion.

Perhaps his most common appearance in the Greek world, certainly in Attica, was as the god of roads and boundaries. Square pillars, called *hermæ*, were common as guideposts and boundary marks. They usually bore the head of the god and a phallus, and on them, as a sacred place, food was sometimes left for needy wanderers. The pillar seems the essential and original sign of the god, and perhaps even earlier the god was present in cairns or heaps of stones, which were called *hermæa*. The worship of Hermes therefore shows a mixture of elements in which conceptions of a heavenly god are combined with worship of rude stones. The name has not been satisfactorily explained, for its etymological identity with *Sarameyas* or *Sarama*, the *dog* of the gods of Indian mythology, is by no means certain, and any other connection in the conceptions of Hermes and *Sarameyas* is hard to see. It is possible that ἑρμα, a "mound" or "cairn," is at the basis of the name, and that the pile of stones in the pasture or on the road is the dwelling place of the god who protects the herds and the wayfarer. Many of his functions, however, agree well with the theory of Roscher, that Hermes is a wind god. This explains his position as swift messenger of the gods, and as guide of the souls, for *wind* and *soul* are closely connected in the primitive conceptions. The variety and apparent lack of connection in his functions would find easy explanation in the union of divinities originally separate.

In art the types of Hermes show a marked change in the course of time. At first he is a bearded man, with the petasus, or broad-brimmed hat, winged shoes, and his herald's staff. Later the type becomes distinctly youthful and vigorous, sometimes with short-girded tunic and cloak, but with the figure often nude, or but lightly draped. The most famous extant statue of *Hermes* is the beautiful figure at Olympia, repre-

senting the god holding the infant Dionysus, the work of Praxiteles. See illustration 3 with *POLYCLITUS*. For Hermes Trismegistus, the Hermes identified with the Egyptian god Thoth, see the paragraph *Egypt*, below. Consult W. H. Roscher, *Hermes der Wind-Gott* (Leipzig, 1878); "Hermes," in W. H. Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. i (Leipzig, 1884-90); Gruppe, *Griechische Mythologie und Religionsgeschichte*, vol. ii (Munich, 1906); L. R. Farnell, *Cults of the Greek States*, vol. v (Oxford, 1909). See *HERM*.

Rome. Mercurius was brought to Rome from the Greeks of southern Italy, as the god of merchants and trade, and this always remained his character in the true Roman religion, as his attributes of the purse and caduceus plainly show. To him, in this respect, a temple was erected in Rome as early as 495 B.C. For Mercury as a god of trade (and its trickeries), consult especially Ovid, *Fasti*, v, 663-692. He was the god especially of the *mercatores*, or merchants engaged in transmarine commerce, and of the dealers in grain, but ultimately was patron of all who bought and sold. His main festival was celebrated annually on May 15, in the Circus Maximus, near the Aventine Hill. The literature of course presents him in all his varied Greek activities (consult, e.g., Horace, *Carmina*, i, 10), but these are absent for the most part from the inscriptions. As the Roman traders penetrated to the north they identified with their tutelary god the Celtic Esus, and even found grounds for regarding the Germanic Wotan as the same divinity. Consult W. W. Fowler, *Roman Festivals* (London, 1899), and G. Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1909).

Egypt. Another divinity identified with Hermes was the Egyptian god Dhouti or Thoth—called Thout(h) or Thôt by Greek writers—and in this case the resemblance is more striking. Originally Thoth was the local god of Chmûnu, the Greek Hermopolis (q.v.), and is usually represented in the form of, or with the head of, an ibis. Before historic times, however, he had become a moon god, worshiped throughout Egypt, and he plays an important part in Egyptian mythology as the assistant of the sun god in his fight against hostile powers. (See *HORUS*.) He was the inventor of writing and the scribe of the gods. A euhemeristic Phœnician tale represents him as a man of ancient times, who invented letters and communicated his discovery to his King, Thamus. Thoth was the judge who decided between Osiris (or Horus) and Set, and he assisted as recorder at the judgment of the dead. (See *DEAD, JUDGMENT OF THE*.) He was the patron of learning and the inventor of all sciences, including especially astronomy and medicine. His sacred animals were the ibis and the cynocephalus. On Thoth as Hermes Trismegistus and on his writings, see *HERMETIC*.

Other Countries. According to Greek accounts, Taaut would seem to have been the Phœnician Hermes, the inventor of letters and sciences; but this is only a late importation of Egyptian ideas, as may be seen from the name of the deity and from the fact that he is called a son of Misor, or Egypt. Sumes, a name of obscure etymology, is given as the Punic name of Hermes. Among the Babylonians Nabû, the god of Borsippa, worshiped in the planet Mercury, corresponded to Hermes in many of his attributes. The later Arabs relate many fables

about Hermes, stating, e.g., that Hermes Trismegistus (see the paragraph *Egypt*, above) once lived at Calovaz in Chaldaea, but these stories are all worthless distortions of very late Greek traditions.

MERCURY. The planet nearest the sun. Its mean distance from the sun is 35,700,000 miles, its periodic time 88 days, its diameter 2770 miles, mass $\frac{1}{16}$ of the earth's; density 0.56, that of earth being unity. The eccentricity of its orbit is greater than that of any other major planet, being 0.20562, and consequently its greatest and least distances from the sun differ by nearly 15,000,000 miles; the inclination of the orbit to the ecliptic is $7^{\circ} 0' 1.4''$. Since Mercury is an inferior planet it is seen alternately east and west of the sun, at an apparent angular distance never exceeding 29° , and its apparent motion in the orbit is at times retrograde. When a change in the apparent motion takes place it appears for a short time stationary. During the year Mercury is morning star in the east three times and evening star in the west three times. Owing to its nearness to the sun it is never above the horizon more than about two hours after sunset or the same time before sunrise. On this account, and from its small apparent size ($5''$ to $13''$ angular diameter), it is seldom distinctly observable by the naked eye. It is said that Copernicus was never able to see it. It is very difficult to observe any markings on Mercury's surface, and there is consequently much doubt as to the period of revolution on its axis. In 1889 Schiaparelli (q.v.) announced that he had been able to fix this period at 88 days, in precise accord with the period of the planet's revolution around the sun. If this be correct (and it has received some confirmation from the observations of Lowell), Mercury always turns the same side towards the sun. This undecided question concerning the rotation time of Mercury is of much importance in theoretical astronomy. Like Venus, Mercury shows phases (q.v.) similar to those of the moon. On account of the great eccentricity of its orbit its longitudinal libration is much greater than that of the moon, amounting to 47° ; consequently only three-eighths of the surface of the planet is always illuminated and three-eighths is always dark. See ASTRONOMY; PLANETS; SOLAR SYSTEM; TRANSIT OF VENUS.

MERCURY, or QUICKSILVER. A metallic element that has been known since ancient times. As early as 300 B.C. Theophrastus mentions "liquid silver," which he says is obtained by rubbing cinnabar with vinegar in a copper vessel. Dioscorides describes the production of mercury by subliming cinnabar with charcoal in an iron pot. Pliny gave it the name of *hydrargyrum* when so obtained, while native mercury he called *argentum vivum*. Mercury was extensively studied by the alchemists, who believed that it was one of the component parts of all metals, and they were familiar with the method of purifying it by distillation. Many of the alchemists and iatrochemists considered mercury a metal; but this was disputed, and even as late as 1735 some chemists contended that it was a semimetal. Not until 1759, when Braune found it possible to solidify it by exposure to a freezing mixture, was its metallic nature established beyond dispute.

Mercury is found in small quantities in the metallic state, but the sulphide *cinnabar* with 86.2 per cent mercury is the most common ore

mineral. Silver and gold amalgam, *calomel* (HgCl_2), quicksilver oxide (*montroydite*), are found, and may be secondary minerals developed from the sulphide. Mercurial tetrahedrite is not uncommon, while primary minerals of rare occurrence include black telluride of quicksilver (*coloradoite*), the selenide (*tiemannite*), etc. Mercury ores are found in formations ranging from Ordovician to recent in age, and in many different kinds of rock, although igneous rocks are often more or less closely associated with the ore. The ores occur as veins, disseminations, or as irregular masses, with silica, calcite, and bitumen as commonly associated minerals. Although mercury ores are widely distributed, the main production comes from a few occurrences. In the United States the coast ranges of California contain a number of deposits, whose yield in the past has been considerable, while the more recently developed district of Terlingua, Texas, has contributed notably to the supply. In Europe long-productive deposits are known at Almaden, Spain, while the ore bodies of Tuscany and Vallalta-Sagron, Italy, and Idria, Austria, are also of importance. In 1913 the production of the different countries in metric tons was as follows: United States, 688; Spain, 1490; Austria-Hungary, 855; Italy, 988; Mexico and others, 150; total, 4171. Exports of quicksilver from the United States, which were one and a half million pounds in 1904, fell steadily to 1914 when they were 64,000 pounds.

Mercury (symbol, Hg; atomic weight, 200) is a silver-white liquid metal that solidifies at -39.5°C. , and, while slightly volatile at ordinary temperatures, boils at 357°C. Its specific gravity at 0°C. (32°F.) is 13.59. Mercury is used chiefly in the manufacture of fulminate for explosive caps, of drugs, of electrical appliances and scientific apparatus, and to a lesser extent than formerly in the separation of gold and silver from their ores. A new use is the floating of lighthouse lights on a body of quicksilver. It dissolves and possibly combines chemically with nearly all of the metallic elements to form alloys termed "amalgams." (See AMALGAM.) With oxygen it forms two oxides. One of these, the mercurous oxide, is obtained by the action of caustic alkalis on mercurous salts. The other, the mercuric oxide, can be obtained either as a brick-red or a yellow substance. Careful heating of mercuric nitrate yields the red modification, while adding a solution of a mercuric salt to a solution of sodium or potassium hydroxide gives the yellow form. The mercuric oxide is used in medicine and as an oxidizing agent in chemical operations. Corresponding to the two oxides mercury forms two series of compounds, which are known as mercurous and mercuric salts. Among these one of the most important is the mercuric sulphide found native as cinnabar, and when prepared artificially is the red pigment known as vermilion (q.v.). The two chlorides are important commercial salts, and of these the mercurous chloride or *calomel* (q.v.) occurs native; the artificial product is used largely in medicine to correct torpidity of the liver. The mercuric chloride, or *corrosive sublimate*, finds extensive use in medicine as an antiseptic, and is extensively used for the preservation of skins and natural-history specimens. Mercuric ammonium chloride is a white powder that is extensively used in medicine, under the name of *white precipitate*, especially in the form of ointment. Metallic mercury and its salts are poisonous, and

chronic mercurial poisoning is common among those who habitually work with the metal. When taken internally, salivation, ulcers of the mucous membrane of the mouth, and ultimately paralysis, result. The usual antidotes are albumen, milk, and flour and water. See also HYDRIDIC ACID; HYDROCYANIC ACID.

Metallurgy. Many mercury ores now worked may not contain more than 1 or 2 per cent of the metal. Practically the only ore which is regularly worked for mercury is cinnabar. Mercury may be extracted from cinnabar in several ways, but two methods only are used upon a large scale. They are (1) extraction by heating the ore in furnaces having a free supply of air, and (2) extraction by heating the ore with lime or iron in retorts, air being excluded. In both methods the chemical reactions take place at temperatures above the boiling point of mercury, so that the latter is volatilized and has to be condensed. Heating the cinnabar with access of air is a process performed in shaft, reverberatory, or shelf furnaces, and is preferred to methods using lime or iron, inasmuch as it is more economical and less dangerous to the workmen. The leading objection to this method is the dilution of the mercurial vapors by sulphur dioxide, oxygen, nitrogen, and the products of combustion. For these reasons it is rather difficult to condense the mercury, and therefore there are losses of the metal through incomplete condensation. On the other hand, where the mercury is extracted by heating the cinnabar with lime or iron in retorts, the mercurial vapors are in a condensed form because no air is allowed to enter the retorts. These vapors are condensed so that with a high grade of ore the output is somewhat greater than by the first process. On account of the greater expense of labor and fuel, and the unhealthfulness of the process, due to the escape of mercurial vapors in emptying the retorts, the process is less frequently employed.

Mercury is transported in wrought-iron flasks closed by a screw stopper, each flask holding about 76 pounds of metal. Sheepskin bags are also used for this purpose.

Bibliography. G. F. Becker, "Quicksilver Deposits of the Pacific Slope," in *United States Geological Survey, Monograph 13* (Washington, 1888); Egleston, *Metallurgy of Silver, Gold, and Mercury* (New York, 1890); C. Schnabel, *Handbook of Metallurgy* (ib., 1905-07); Heinrich Ries, *Economic Geology* (3d ed., ib., 1910); McCaskey, "Quicksilver," in *United States Geological Survey, Mineral Resources* (Washington, 1911); Waldemar Lindgren, *Mineral Deposits* (New York, 1913).

MERCURY, Dog's (*Mercurialis*). A small genus of plants of the family Euphorbiaceæ. The common dog's mercury (*Mercurialis perennis*), common in woods and shrubby places in Europe, has a simple stem about a foot high, rough ovate leaves, and axillary loose spikes of greenish flowers. It turns a glaucous black in drying. The root, which is very poisonous, contains two coloring substances, one blue and the other carmine. The mercury mentioned by some writers as a potherb is not this plant, but *Che-nopodium bonus-henricus*. Annual dog's mercury (*Mercurialis annua*) is eaten in Germany as spinach. The three-seeded mercury is an allied plant, *Acalypha*, of which there are a number of species.

MERCURY, MEDICINAL USES OF. The 21 official preparations of hydrargyrum, or mer-

cury, may be classified as follows: (1) *preparations of mercury*, including mercury with chalk, blue mass, mercurial ointment, and two plasters of mercury; (2) *the chlorides of mercury and their preparations*, including calomel, corrosive sublimate, and others; (3) *the oxides and their preparations*, including the red precipitate and others; (4) *the iodides and their preparations*, including the red iodide, the yellow iodide, and others; (5) *acid combinations and their preparations*, including the solution of mercuric nitrate and others; (6) *cyanide of mercury*; and (7) *the triturations*. Besides the official preparations the following unofficial preparations are well known: yellow solution of mercury (yellow wash), black lotion of mercury (black wash), and red ointment of mercuric nitrate (brown citrine ointment).

Mercury is purgative, alterative, and tonic, and promotes the flow of bile. Some of its preparations are corrosive, some are caustic, some are poisonous. In small quantities some of the mercurials are tonic, while in large or long-continued doses they cause poverty of the blood, diminishing the number of the red corpuscles, reducing nutrition, and impairing digestion, finally causing waste of tissue. Long-continued exhibition of mercury causes a cachectic condition termed hydrargyrim. Mercury stimulates glands to a production of an increased amount of secretion. Hydrargyrim, commonly called salivation from one of its symptoms, is recognized by a fetid breath, swollen and spongy gums with a blue marginal line, sore mouth, swollen and tender tongue, excessive production of saliva, loss of appetite, diarrhœa, and fever.

Mercury is used in syphilis, tonsillitis, and other glandular affections, gastritis, dysentery, gastric ulcer, early cirrhosis of the liver, typhoid fever, diphtheria, Asiatic cholera, pneumonia, gastroenteric disturbances, conjunctivitis, enlarged thyroid, and enlarged spleen. Mercury, according to the modern view, is not curative of syphilis as is salvarsan (q.v.). In syphilis intensive medication has lately been tried by means of hypodermic injections, gray oil, salicylate of mercury as well as the benzoate and succinimide being used for this purpose.

Bichloride of mercury is very largely used as an antiseptic. It is irritant and corrosive, and in toxic doses causes severe gastrointestinal irritation, nausea, vomiting, suppression of urine, bloody diarrhœa, convulsions, and collapse. It is, however, a safe and valuable internal remedy in proper dosage. It is used locally as a parasiticide in a solution of 1 part in 250 parts of water, and as a general surgical antiseptic in a solution of 1 part to 1000 of water, or 1 to 2000, sometimes 1 part to 5000 of water. In these dilutions it is an efficient antiseptic for cleansing wounds, moistening gauze dressings, injecting into cavities, etc. See ANTIDOTE; TOXICOLOGY.

MERCURY, WAND OF. See DIVINING ROD.

MERCURY FULMINATE. See EXPLOSIVES.

MERCUTIO, mèr-kū'shiō. A character in Shakespeare's *Romeo and Juliet*, the kinsman of the Prince of Verona and friend to Romeo. He is killed in a quarrel with Tybalt.

MERCY, FATHERS OF. A religious congregation of the Roman Catholic church founded by Jean-Baptiste Rauzan (1757-1847), a zealous French priest, at Lyons in 1808, later suppressed by Napoleon, and reestablished in 1814. Its constitution was approved by the Pope in 1834, under the title of Society of the Priests of

Mercy. The members devoted themselves to mission preaching and works of charity. Monsignor De Forbin-Janson, Bishop of Nancy, brought two of them to America in 1839, and houses were established in New York and in St. Augustine, Fla. Shortly after they came to New York to take charge of the French Catholics, and still have charge of certain parishes in Manhattan and Brooklyn. In 1903 the mother house in Paris was closed by the government under the Associations Law, and the headquarters were accordingly transferred to Rome. Consult Delaporte, *Vie de Jean-Baptiste Rauzan* (Paris, 1857).

MERCY, SISTERS OF, or ORDER OF OUR LADY OF MERCY. A Roman Catholic religious community founded in Dublin in 1827. They are of two classes, choir sisters and lay sisters, the choir sisters being occupied with the visitation of the sick and prisoners, the care of poor and virtuous girls, and other charities; the lay sisters being employed in the domestic occupations of the convent. Each community is independent of the rest of the order, being subject only to the bishops. The origin of the order was due to Miss Catherine McAuley, of Dublin, who, born of Roman Catholic parents and left an orphan, having been educated a Protestant, joined the Roman Catholic church and devoted her life and ample fortune to the service of the poor. The order has been introduced into many parts of Ireland, England, Scotland, and America. After a preliminary preparation of six months, candidates assume the white veil and become novices. The novitiate lasts two years. Their vows bind them to poverty, celibacy, obedience, and the care of the sick and poor. In the United States their first, now the mother, house was opened in Pittsburgh, Pa., in 1843, and they are now very widespread, numbering over 4700 sisters and having, in addition to schools, 53 hospitals and 67 orphanages. Consult Carroll, *Life of Catherine McAuley* (London, 1866), and *Leaves from the Annals of the Sisters of Mercy* (3 vols., New York, 1881).

MERCY SEAT. The ordinary translation of the Hebrew *Kapporeth* (Ex. xxv. 17 et seq.), signifying the "covering" of the Ark of the Covenant (q.v.).

MER DE GLACE, mâr de glâs (Fr., sea of ice). One of the largest and most interesting of the Alpine glaciers. It lies on the northern slope of Mont Blanc and is formed by the confluence of three branches known as the Glacier du Géant, the Glacier du Lechaud, and the Glacier du Talèfre. Its extreme length is about 9 miles, and in all it covers an area of 16 square miles. The rate of flow, compared with other glaciers of the Alps, is very rapid, the average advance during the summer and autumn months being about 2 feet per day. The Mer de Glace is noted for its beautiful scenery and is one of the favorite tourist resorts in the Alps. It is most easily reached from the village of Chamonix, near which it debouches into the valley as the Glacier des Blois and gives rise to the Arveyon River. See **GLACIER; MONT BLANC;** and Illustration accompanying **CHAMONIX.**

MÉRÉ, PAUL LOUIS. See **COURIER DE MÉRÉ, P. L.**

MEREDITH, GEORGE (1828-1909). A distinguished English novelist and poet of mixed English, Irish, and Welsh descent. He was born in Portsmouth, Hampshire, the son of Augustus Armstrong Meredith, a naval outfitter, on Feb.

12, 1828. In his fourth year his mother died. He became a ward in chancery. He was educated at Portsmouth and Southsea, and at Neuheim on the Rhine; and he remained until he was sixteen in Germany—a land whose influence, especially through its poetry and music, is perceptible in his writings. On returning to England he studied law for a while, but soon abandoned it, as his literary genius began to make itself felt. His first published poem, "Chillian Wallah," appeared when he was only 21, in *Chambers's Journal* (July, 1849), and he lived somewhat precariously for a number of years by journalistic work. He married, in 1849, Mrs. Nicholls, a daughter of Thomas Love Peacock (q.v.), and it was to Peacock that he dedicated his first volume, *Poems* (1851). From Mrs. Nicholls (died 1861) he separated, and in 1864 married Miss Vulliamy (died 1885). Original and unique as Meredith's novels are, it is possible to trace in them an inheritance from the dilettante, whimsical work of his father-in-law. After *The Shaving of Shagpat*, "an Arabian entertainment" (1855), and *Farina*, an imitation of a grotesque phase of German romanticism (1857), he published his first novel in 1859—strange as it now seems to associate the two dates, the year of the publication of George Eliot's first novel, *Adam Bede*. This book, *The Ordeal of Richard Feverel*, which many of his admirers think he has never surpassed, contains some of his most beautiful passages in its tender love episodes with their note of Celtic passion. *Evan Harrington* (1861) was a more purely humorous treatment of the psychological problems involved in the great question whether a tailor could be a gentleman. A year later appeared *Modern Love*, and *Poems of the English Roadside*. The splendid sonnet sequence, *Modern Love*, is now recognized as probably its author's highest and most durable achievement in the poetic form; but at the time it was severely criticized, especially by the *Spectator*, in which Swinburne replied with a fervid eulogy. Among the few accessible biographical data, the close association of three of the foremost writers of the century is worth mentioning; for a short time in 1863, after the first two had lost their wives, Meredith, Rossetti, and Swinburne shared a house in Cheyne Walk, Chelsea. *Emilia in England* (afterward called *Sandra Belloni*) came out in 1864, and the next year *Rhoda Fleming*, as a story the simplest and the best told from an artistic point of view—a savage onslaught on the idols of fatuous respectability, a digging down to the elemental and primitive passions. When the war between Austria and Italy broke out in 1866, Meredith, who had already done considerable work in journalism, went out as the correspondent of the *Morning Post*. He turned to good account the knowledge of Italy thus gained and his sympathy with Mazzini and the cause of Italian independence in his next book, *Vittoria*, a sequel to *Emilia in England* (1867). For some 30 years he acted as literary adviser to the publishing house of Chapman and Hall, and helped many a young author by his wise and kindly criticism. Thomas Hardy, in particular, has said that he would probably never have persevered in the path of literature without the encouragement which Meredith gave him when he submitted his first manuscript. Meanwhile Meredith was going on steadily with his own work. In 1871 he brought out *The Adventures of Harry Richmond*, a fascinating romantic

novel, which is recommended to beginners as easier reading than the metaphysical, subtle, enigmatic style of his later books. It had undoubtedly no small influence on younger writers, and the class of romantic stories at the head of which stands *Prince Otto* may be clearly derived from it. *Beauchamp's Career* (1876) is largely occupied with English politics. While standing aloof as usual from questions of actual detail, Meredith allowed his philosophic liberalism to be seen almost distinctly, though he did not declare for either side. *The Egoist* (1879) made a pitiless analysis of innate selfishness. In its central figure, Sir Willoughby Pattern, the complete egoist takes on final shape and becomes typical. In fact, it may be said of Meredith generally that, unlike most psychological novelists, he gives us a psychology of types, not of individuals. In 1880 came *The Tragic Comedians*, recounting in the guise of fiction a decisive episode in the life of Ferdinand Lassalle, the German Social Democrat; and in 1883 another volume of verse, *Poems and Lyrics of the Joy of Earth*. All this time, in spite of such a bulk of admirable work, and although recognized by an increasing number of cultivated people, Meredith had remained strangely unknown to the public at large—in this like Browning, with whom in many ways his genius had strong affinities. The publication of *Diana of the Crossways* (1885), partly, perhaps, because its central episode bore a strong resemblance to an actual occurrence in English political life of a generation earlier, made a general impression and drew attention to work Meredith had done a quarter of a century earlier. From this time he came more and more to be recognized as the head of the profession of letters in England. He was elected president of the British Society of Authors on the death of Tennyson in 1892; and his appearance as the guest of honor at the meeting of the Omar Khayyam Club (an organization including many of the best-known men of letters) in 1895 was an event of singular interest, from the universal homage paid to him, as well as from the fact that he then made what he called his first public speech. On his seventieth and eightieth birthdays he was presented with congratulatory addresses, signed by the most prominent English writers of the day, and in 1905 he received the Order of Merit from Edward VII. He died May 18, 1909. A memorial service for him was held in Westminster Abbey, but he was not buried there, despite a widespread desire and a petition sanctioned by the Prime Minister, Asquith. His body was cremated and the ashes placed beside his second wife's grave at Dorking. Four more novels remain to be mentioned: *One of Our Conquerors* (1891), *Lord Ormont and his Aminta* (1894), *The Amazing Marriage* (1895), and the early but unfinished and posthumously published *Celt and Saxon* (1910), as well as notable volumes of verse—*Ballads and Poems of Tragic Life* (1887), *A Reading of Earth* (1888), *The Empty Purse* (1892), *Odes in Contribution to the Song of French History* (1898), *A Reading of Life* (1901), and *Last Poems* (1910), published after his death. His poems, like his novels, will probably never be popular; and for the same reason, that they require too much thought on the part of the reader. Yet as a poet he has many remarkable achievements to his credit, and none more signal than the expression of a perfect understanding of nature—nature as she is in herself, not, as with Byron

and so many others, the mere reflex of the poet's temperament and moods. A comedy, *The Sentimentalists*, which was presented in 1910, may also be mentioned here.

Meredith's fiction is characteristic of an age of analysis and introspection, when every art must take account of the results of psychology and metaphysics. He is before all things a student of life. His attitude, as illuminated by the *Essay on Comedy* (1877), is not unlike that of his own Adrian Harley in *Feverel*; with an amused but not unkindly cynicism he stands off and watches his characters act on each other as deliberately, as inevitably, and often through situations as apparently unimportant as in life. He shows us the progress from act to act of dramas subtly philosophical, in the manner of *Hamlet*. We are reminded of Shakespeare again as we think of one of Meredith's strongest points—his gallery of fair women, types of the best in their age, for parallels to which we are driven to recur to Beatrice and Rosalind and Portia.

His style is frequently obscure—not because he cannot write simply, for (like Browning again) he can give us "English as ripe and sound and unaffected as the heart could wish." His aim, however, is not simplicity; it is to pack as much thought as possible into a phrase, to say only what is worth saying, and to say it in terms charged to the fullest with significance. The final verdict of his contemporaries, slowly though it was reached, is justified by his unquestioned intellectual eminence.

Bibliography. The Memorial Edition (London, 1910) of Meredith's complete works is the best, for the Authorized Edition (London, 1897) contains only the works as revised—with excisions—by the author. The former, while giving the revised text, includes the excisions separately for those who desire them. To many good judges the novels in their earlier and unrevised forms are superior to the later revised versions. Not included in his collected works may be mentioned *Up to Midnight: A Series of Dialogues . . . now Reprinted for the First Time* (Boston, 1913), which may have its interest for Meredithians. Consult: Richard Le Gallienne, *George Meredith: Some Characteristics* (London, 1890), which contains a careful bibliography; essays by W. E. Henley, in *Views and Reviews* (ib., 1890), and by W. C. Brownell, in *Victorian Prose Masters* (New York, 1901); W. L. Cross, *The Development of the English Novel* (new ed., ib., 1905); M. W. Abbott, *Browning and Meredith: Some Points of Similarity* (Boston, 1904); P. E. More, "Novels of George Meredith," in *Shelburne Essays* (2d series, New York, 1905); M. S. Henderson, *George Meredith* (London, 1908), valuable; J. A. Hammerton, *George Meredith in Anecdote and Criticism* (ib., 1909); J. W. Beach, *The Comic Spirit in George Meredith: An Interpretation* (New York, 1911); A. M. Trevelyan, *Poetry and Philosophy of Meredith* (ib., 1912); William Sharp, in *Papers, Critical and Reminiscent* (ib., 1912); *Letters of Meredith* (2 vols., ib., 1912), edited by his son.

MEREDITH, LOUISA ANNE (née TWAMLEY) (1812-95). An Australian writer, born at Birmingham, England. Chiefly educated by her accomplished mother, at an early age she wrote verse and practiced art with success. In 1833 she published an octavo volume of *Poems with Illustrations*. She continued to write, and in 1839 married her cousin, Charles Meredith, and accompanied him on his return to Australia.

Her *Notes and Sketches of New South Wales* was followed by *My Home in Tasmania* and many other notable works. In 1860 appeared *Some of my Bush Friends in Tasmania*, a large and elaborate work on the flora of the colony. Poems and novels followed. The Tasmanian government granted her a pension of £100 a year. She received numerous prize medals for botanical drawings of Tasmanian subjects, at the exhibitions of London, Melbourne, Sydney, and Calcutta. Her first volume of verse appeared in 1833, and her last, *Grandmama's Verse-Book for Young Australia*, in 1878.

MEREDITH, OWEN. The pseudonym of Lord Lytton. See **LYTTON, EDWARD ROBERT BULWER.**

MEREDITH, SOLOMON (1810-75). An American soldier and politician, born in Guilford Co., N. C. He removed to Indiana in 1830, was sheriff of Wayne County (1834 and 1836) and member of the Legislature (1846-48 and 1854-56), and upon the outbreak of the Civil War he was made colonel of the Sixty-ninth Indiana Volunteers. He participated in many of the most desperate battles fought by the Army of the Potomac and became the commander of the famous Iron Brigade. He fought at Gainesville, Chancellorsville, and Gettysburg. At the close of the war he was retired with the brevet rank of major general of volunteers. He was deeply interested in scientific agriculture and introduced several improvements.

MEREDITH, SIR WILLIAM RALPH (1840-). A Canadian jurist and politician, born in Middlesex Co., Ontario, of Irish descent. He was educated in London, Ontario, and at Toronto University, studied law, and was called to the bar in 1861. He practiced his profession for many years in London, and in 1888 removed to Toronto. In 1872 he was elected a Conservative member of the Ontario Legislature, and in 1878 became leader of the Conservative Opposition therein, a position which he retained until 1894, when he was appointed Chief Justice of the Court of Common Pleas. In 1895 he was made a senator, and in 1900 chancellor, of Toronto University; this office he held for more than 14 years. In 1912 he became Chief Justice of Ontario. He was knighted in 1896. He manifested remarkable ability both as a lawyer and parliamentarian and was identified with much useful and progressive legislation, especially in behalf of workingmen. He was a member of the commissions for the revision of the provincial statutes (1896 and 1906), for investigating the affairs of Toronto University (1905), and upon laws relating to the liability of employers (1910).

MERES, mērz, FRANCIS (1565-1647). An English author and divine. He was educated at Pembroke College, Cambridge, graduating B.A. in 1587 and M.A. in 1591. By 1597 he was living in London, where he gained an intimate knowledge of contemporary literature. In 1602 he became rector of Wing in Rutland and subsequently opened a school. He died at Wing, Jan. 29, 1647. His *Palladis Tamia, Wits Treasury* (1598) gives an account of Marlowe's death and an estimate of Shakespeare. After mentioning 12 of Shakespeare's plays and the "sugred sonnets among his private friends," Meres says, "The muses would speak Shakespeare's fine filed phrase, if they could speak English." The important sections dealing with Elizabethan literature were reprinted in *Shakespeare Allusion Books*, New Shakespeare Society (London, 1874),

and by Arber in the *English Garner*, vol. ii (London, 1879).

MERETRIX, mēr'ē-trīks. See **HETÆRÆ.**

MEREZHKOVSKY, mēr'ēsh-kōf'skī, **DMITRY SERGEYEVITCH** (1865-). A Russian poet, novelist, and critic. He was born and educated at St. Petersburg. He published his first volume of verse in 1888. This was followed by two other collections, after which the author forsook poetry for prose. He made his debut as a literary critic with an essay entitled "The Causes of Decadence in Modern Russian Literature" (1893), which attracted considerable attention. When he published his scholarly and comprehensive studies, *Tolstoy and Dostoyevsky as Men and as Artists* (1901) and *The Religion of Tolstoy and Dostoyevsky* (1902), his reputation as a critic was firmly established. Then came his trilogy of historical novels dealing with the great conflict of Christianity and paganism. The series is entitled *Christ and Antichrist* and the separate volumes are variously known as *The Death of the Gods*, or *Julian the Apostate* (1901); *The Resurrection of the Gods*, or *Leonardo da Vinci* (1902); and *Peter and Alexis* (1905). Some idea of the nature and magnitude of this work may be had from the fact that its author spent 12 years in its preparation, which involved extensive travel. The entire series, as well as his studies of Tolstoy and Dostoyevsky, may be had in English and other languages. Mention should be made also of his dramas *Paul I* (1908) and *Alexander I* (2 vols., 1913). His other work includes much critical writing and translations of classic drama. His collected works, published at St. Petersburg in 1911-12, number 15 volumes. Consult Persky, *Contemporary Russian Novelists* (Boston, 1913).

MERGAN'SER (Neo-Lat., from Lat. *mergus*, diver + *anser*, goose). A small subfamily of ducks, *Merginæ*, having a slender, straight, much compressed bill, hooked at the tip and notched at the edges, almost as if furnished with teeth. Their other anatomical peculiarities are like those of the sea ducks. They feed largely upon fish, which they are said to pursue and capture under water. Most of the species have little food value, but the hooded merganser (*Lophodytes cucullatus*) is said to feed upon roots and seeds and is thus a palatable table duck. The males are black and white, with a large, circular crest, giving them a peculiar and striking appearance; the adult female also has a crest, but it is small, grayish brown, tinged with cinnamon. (See Plate of NORTH AMERICAN WILD DUCKS in article DUCK.) The hooded merganser is the smallest of the North American species, only 1½ feet in length. The other two species, the goosander (*Merganser*, or *Mergus, americanus*) and the red-breasted merganser or sheldrake (*Merganser*, or *Mergus, serrator*), are nearly or quite 2 feet long, and have no true crest, though the feathers of the crown may be somewhat lengthened. The hooded and red-breasted mergansers are found in nearly all parts of the Northern Hemisphere, while the goosander is replaced in Europe by a very closely allied species (*Merganser*, or *Mergus, merganser*). All of these species breed in the northern portions of their range and winter southward almost to the tropics. About half a dozen other mergansers are known, one or two of which are South American.

MER'GER. 1. In the law of real property, the union of a lesser with a greater estate in the

same property in the same person, with the result that the lesser estate is obliterated by the larger estate. Thus, if one is a tenant for years or for life of real estate, and the estate of his landlord or the reversioner in fee comes to him either by descent or purchase, the tenancy is merged in the larger estate and the tenant becomes owner in fee. If, however, there be an intermediate estate, merger is prevented. Thus, if one be in possession of property as tenant for years, with remainder to another for life, and remainder to a third in fee, there will be no merger if the fee remainderman convey his estate to the tenant for years; but if the owner of the life estate convey to the tenant for years, or vice versa, the tenancy for years will merge in the life estate. Courts of equity will in many cases, where justice requires it, in effect prevent merger by compelling the owner of the estate to hold the property as though the two estates were distinct. Thus, for example, if a tenant of real estate in his own right purchased the reversion as trustee for another, a court of equity would compel him to continue to collect the rents from himself as tenant and to account to the beneficiary for them as trustee of the reversion. In the same manner when the legal estate in property becomes vested in one having an equitable claim with reference to the property, or an equitable estate as it is sometimes called, the equitable becomes merged in the legal estate and so disappears, unless kept alive for the purpose of furthering justice, when equity will treat the two interests as distinct notwithstanding the merger. Consult the authorities referred to under TRUSTS; MORTGAGE.

2. In the law of contracts, the acceptance of a higher security or obligation in lieu of a lower extinguishes the lower. Thus, rights upon contract are merged in a judgment secured in an action upon the contract. A simple debt merges in a promissory note given in its stead, and both merge into a bond or obligation under seal given in their place.

3. In the criminal law, the inclusion of a lesser crime in a greater and the sinking of private wrongs in public wrongs or crimes. Many greater crimes include lesser crimes, as an assault in committing robbery or homicide. The state may prosecute and punish either the greater or the lesser offense, but of course not both, since that would be putting a man twice in jeopardy for the lesser offense. In England, where criminal prosecutions are usually conducted by private persons, whenever a tort, as an assault or a libel, is also a crime, the private wrong is postponed to or merged in the public wrong, so that the injured party has no private remedy until after the conviction and punishment of the criminal. This does not generally hold in the United States, however. Consult the authorities under TORT.

4. The consolidation of the control of two or more corporations in a single corporation by the device of issuing the stock of the new corporation, known as the holding company, in exchange for a majority of the stock of the several corporations to be controlled. The several corporations to be controlled are then said to be merged in the single corporation holding their stock. The United States Supreme Court decided that the Northern Securities Company formed to hold the stock of the Great Northern and Northern Pacific Railway companies was an illegal combination in restraint of interstate commerce.

See RESTRAINT OF TRADE, CONTRACTS IN; SHERMAN ACT.

MERGUI, mër-gé'. The capital of the Mergui Archipelago (q.v.).

MERGUI ARCHIPELAGO. A group of islands in the Bay of Bengal, along the coast of the Tenasserim division of Lower Burma, of which they form a part (Map: Burma, C 4). The islands, numbering about 800, are rocky and mountainous, some of them rising to 3000 feet above sea level, and are noted for their varied and picturesque scenery. The largest, King Island, has permanent habitations, but the others are inhabited by a race called Salons, or sea gypsies, who rove from island to island and subsist mainly by pearl fishing and collecting and selling edible birds' nests. Tin mines are worked in the south. Area of district, 9789 square miles; pop., 1901, 88,744; 1911, 111,424. Mergui, the capital of the district, with a heterogeneous population of 11,987 in 1901 and 14,889 in 1911, is situated on an island at the chief outlet of the Tenasserim River in the Bay of Bengal. It has an average rainfall of 103 inches. It is the centre of a pearl-fishing industry of considerable importance.

MERIAN, mǎ-ré-àn, MARIA SIBYLLA (1647-1717). A German painter and naturalist, born in Frankfort-on-the-Main, daughter of the engraver Matthäus Merian. She studied under Mignon and in 1665 married Johann Andreas Graff, a painter, and removed to Nuremberg. Though she was skillful in painting fruits and flowers, her taste led her particularly to natural history. Her exquisite taste, as well as the great precision which characterized her artistic work in botany and entomology, gained for her a high reputation in the scientific world of the time. In 1679 she published an excellent work on caterpillars, entitled *Erucarum Ortus, Alimentum et Paradoxa Metamorphosis*. In 1698 she went to South America and devoted herself to research on the natural history of Dutch Guiana, the result of which appeared in her *Metamorphosis Insectorum Surinamensium* (1705). There are two volumes of her drawings in the British Museum, one of the insects of Europe, the other of those of Dutch Guiana. There are collections in St. Petersburg, Amsterdam, and Frankfort.

MERIAN, MATTHÄUS, called THE ELDER (1593-1650). A Swiss engraver. He was born at Basel, studied under Dietrich Meyer, of Zurich, and afterward lived in Paris and Frankfort. He began in 1640 the famous Zeiller's *Topographia*, presenting perspective views of European cities, towns, and castles which were drawn, engraved, and described by himself. The work, which is regarded as extremely valuable, was continued after his death. For his biography, consult Eckardt (Basel, 1887).

MERICI, SAINT ANGELA. See ANGELA MERICI, SAINT.

MÉRICOURT, THÉROIGNE DE. See THÉROIGNE DE MÉRICOURT.

MÉRIDA, mǎ-ré-dá. The capital of the State of Mérida, Venezuela, situated about 60 miles south of Lake Maracaibo, on a plateau 5500 feet above sea level (Map: Colombia, C 2). It has a cool, moist climate, with an average temperature of 64.5° F. It has a cathedral and is the seat of one of the two universities of the Republic. Its chief manufactures are carpets, cotton and woolen goods; it exports coffee and preserved

fruits. Pop., municipal, 1891, 13,366; 1913 (est.), 16,000. Mérida was founded in 1558 by Juan Rodríguez Saurez. It has suffered much from earthquakes, notably in 1812 and 1894.

MÉRIDA. The capital of Yucatan, Mexico, situated on a barren plain in the northwestern part of the peninsula, 25 miles from the Gulf of Mexico (Map: Mexico, O 7). The town is regularly built, with fine streets, squares, and parks, and has a university, a cathedral completed in 1598, a government palace, a museum, various secondary schools, and a hospital. Among its manufactures are straw hats, cotton goods, soap, and leather, while great quantities of sisal grass are exported from here to the United States, as well as brandy, sugar, hides, indigo, and salt. Pop., 1910, 62,447. Mérida was founded in 1542 by Francisco Montejo, who was the conqueror of Yucatan.

MÉRIDA. A small town of southwest Spain, in the Province of Badajoz, situated on the right bank of the Guadiana, 30 miles east of Badajoz (Map: Spain, B 3). It is now an insignificant town, but contains numerous evidences of its ancient greatness. Among these are the remains of the Roman walls with five gates still preserved, a triumphal arch erected by Trajan, the ruins of an amphitheatre and of a Roman circus built to accommodate 20,000 spectators, some remains of a temple of Diana, and parts of an old reservoir and of two Roman aqueducts, as well as numerous columns, statues, and minor ruins. There is also a magnificent Roman stone bridge crossing the Guadiana by 64 arches and nearly half a mile long. Mérida was founded as a colony for Roman veterans (*emeriti*), and called *Augusta Emerita*, whence the present name is derived. It was made the capital of the Province of Lusitania, and later became the seat of the Visigothic archbishops. It remained an important town during the time of the Moorish domination until it was captured by Alfonso IX in 1228. Pop., 1900, 9124; 1910, 14,633.

MERIDEN. A city in New Haven Co., Conn., 19 miles north-northeast of New Haven and 18 miles south-southwest of Hartford, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, D 3). It is picturesquely situated, overlooked by the Hanging Hills on the northwest, and is drained by Harbor Brook. Meriden is one of the most prosperous industrial centres in New England. Among its manufactures are silver and plated ware, hardware, cutlery, steel pens, bronzes, brass castings, firearms, organs, self-playing attachments for pianos and organs, glassware, cut glass, curtain fixtures, electrical goods, gas, electric, and kerosene fixtures, screws, vises, and machinery. The city has the Connecticut School for Boys (reform), Meriden Hospital, Curtis Home for Orphan Children and Aged Women, a fine armory, and the handsome Curtis Memorial Library. Hubbard Park is a beautiful natural reservation of 900 acres, within the limits of which are the Hanging Hills, the highest point rising 1000 feet above sea level. Other attractions are Lake Merimere and Castle Craig.

The government, under a charter of 1897, is vested in a mayor, elected every two years, a bicameral council, and administrative officials, appointed or elected as follows: by the mayor—boards of apportionment and taxation, public works, and police, fire, and park commissioners; by the council—tax collector, plumbing inspec-

tor, fire marshal, boiler inspector, health officer, and board of compensation; by the people—clerk, treasurer, auditor, and sheriffs. The city owns and operates its water works. Pop., 1900, 24,296; 1910, 27,265; 1914, 28,528; 1920, 29,842. The city is included in the township of Meriden, the population of which in 1920 was 34,739. From 1725 until incorporated in 1806 as a town under its present name Meriden was a parish of Wallingford. In 1867 it was chartered as a city. Consult Perkins, *Historical Sketches of Meriden* (West Meriden, 1849), and G. M. Curtiss, *Century of Meriden* (Meriden, 1906).

MERIDIAN (Lat. *meridianus*, relating to midday, from *meridies*, for **medidies*, midday, from *medius*, middle + *dies*, day). Any great circle of a sphere passing through its poles. A *terrestrial meridian* is the intersection of the earth's surface made by a plane passing through the poles. The *prime meridian* is the one from which longitude is measured. The *celestial meridian* of any place on the surface of the earth is the great circle of the celestial sphere passing through the zenith and the celestial poles. The *magnetic meridian* at any point is the horizontal direction at the point of a freely suspended compass needle undisturbed by influences other than the earth's magnetic force. To distinguish the terrestrial or geographical meridian from the magnetic, the former is called the *true meridian*, as its direction is that of true north or south. It is evident from the explanation given that the so-called *magnetic meridian* is not a great circle of the earth, but merely a *direction* at a particular point. The lines joining the points of equal variation are not therefore coincident with the magnetic meridian; they are called *isogonic lines*, and, owing to the nonuniform character of the earth's magnetic force, these lines are very irregular curves. See **MERIDIAN CIRCLE**; **MERIDIAN MEASUREMENT**.

MERIDIAN. A city and the county seat of Lauderdale Co., Miss., 96 miles east of Jackson, on the Alabama and Vicksburg, the Alabama Great Southern, the Meridian and Memphis, the New Orleans and Northeastern, the Southern, and the Mobile and Ohio railroads (Map: Mississippi, H 6). It is the seat of the Meridian Female College (Methodist Episcopal), opened in 1869, the Meridian Male College, the Meridian Academy (Methodist Episcopal South), and Lincoln School (Congregational), the last two for colored students, and has the East Mississippi Insane Hospital, a Carnegie library, and fine courthouse and high-school buildings. The city has an extensive trade and is the most important manufacturing centre in the State. Its industries, represented by railroad machine shops, cotton, cottonseed-oil, and hosiery mills, lumber mills, mattress, broom, fertilizer, and harness factories, wagon works, stave mills, foundries, etc., had, in 1909, a production valued at more than \$4,000,000. The city adopted the commission form of government in 1912. The water works, owned by the municipality, are valued at \$700,000. In March, 1906, a tornado destroyed a large portion of the business district. Meridian was an important Confederate railway centre during the Civil War, and in February, 1864, General Sherman was sent against it. Arriving on the 14th, he remained unmolested until the 20th, destroying the railroads in the vicinity, also the large storehouses and many residences. Pop., 1900, 14,050; 1910, 23,285; 1914 (U. S. est.), 21,806; 1920, 23,399.

MERIDIAN CIRCLE. An instrument used for determining the meridian altitude or zenith distance of a star. It consists of an astronomical telescope firmly fixed to a graduated circle, which moves about a horizontal axis, resting on a pair of very solid supports. In the common focus of the eyepiece and object glass of the telescope is a system of fixed cross wires (spider lines are generally used for the purpose), one being horizontal and five or more vertical, with equal spaces between. An imaginary line passing through the optical centre of the object glass and the intersection of the horizontal and middle vertical wires is called the line of collimation of the telescope, and, when the instrument is in perfect adjustment, this line moves in the plane of the meridian. Besides the above-mentioned fixed wires there is a movable one, called a micrometer wire, which is moved by means of a screw, remaining always parallel to the fixed horizontal wire. If the instrument is in perfect adjustment, and if the image of a star, while passing across the middle vertical wire in the field of view, is at the same time bisected by the fixed horizontal wire, the star is at that moment in the line of collimation of the telescope. It is therefore at that moment in the meridian, and its meridian zenith distance is the angle through which the circle would have been turned from the position it had when the line of collimation of the telescope pointed to the zenith. There is a fixed pointer, for the purpose of approximately reading the instrument. If the instrument was adjusted so that the pointer was opposite the zero point of the circle, when the line of collimation of the telescope pointed to the zenith, the arc measured on the circle between these two positions of the instrument is the meridian zenith distance of the star.

Great nicety is required in reading the instrument, i.e., in determining exactly the arc through which the circle has moved in bringing the telescope from the vertical to any other position. The rim is usually graduated at intervals of five minutes; and the eye could determine only the division nearest to the fixed index. But by means of a reading microscope or micrometer (q.v.), fixed opposite to the rim, the portion of the interval to the nearest division on the rim can be read to seconds. There are sometimes six such microscopes fixed opposite different points of the rim; and the reading of the instrument is the mean of the readings of all the microscopes. This tends to eliminate errors arising from imperfect graduation and errors of observation. If the instrument is properly adjusted, the zero point of the circle will be opposite the fixed pointer when the line of collimation of the telescope points to the zenith. In practice, however, this is not always accurately, or even approximately, the case, and is really of no consequence, as the final result of every observation is the difference between two readings. It is evident that the difference between any two readings of the instrument will represent the angle through which the line of collimation of the telescope moves in passing from one position to the other. It remains to show how a fixed point, viz., the nadir (q.v.), is observed, and then how an observation is taken of the star itself on its meridian passage. It must be explained here that the fixed horizontal wire in the eyepiece of the telescope, in the instrument as now used, is only an imaginary line which determines the line of collimation of the telescope. It coincides with the

position of the micrometer wire when the screw head of the micrometer marks zero.

To observe the nadir, a trough of mercury is placed underneath the instrument and the telescope is turned so as to look vertically downward into it. An image of the system of cross wires which is in the common focus of the object glass and eyepiece will be reflected back again to nearly the same focus. Looking into the telescope, the observer now adjusts it by means of a slow-motion screw till the reflected image of the horizontal wire coincides with the real one. The final adjustment is perhaps most delicately effected by turning the screw head of the micrometer, which moves the wire itself. When they coincide the line joining the centre of the object glass of the telescope with the intersection between the middle vertical and horizontal micrometric wires will be vertical. For that position of the movable wire the circle now gives the exact nadir reading, which differs by 180° from the true zenith reading.

Again, to observe a star in the meridian, the instrument is previously adjusted so that the star, in passing the meridian, shall pass over the field of view of the telescope. As the image of the star approaches the centre of the field the observer adjusts the telescope by the slow-motion screw, so as to bring the image of the star very nearly to the horizontal wire. Finally, just as the star passes the middle vertical wire, he bisects the image of the star with the horizontal wire by a touch of the micrometer screw head. The circle being now clamped, the reading is determined as before by reading the pointer and microscopes and adding or subtracting, as the case may be, the reading of the micrometer. This reading now subtracted from the zenith reading gives the meridian zenith distance of the star; and this, again, subtracted from 90° , gives its meridian altitude above the horizon. See TRANSIT INSTRUMENT.

MERIDIAN MEASUREMENT. The determination of the form and size of the earth from the measurement of a meridional arc has been a favorite problem with mathematicians from the earliest times, but up to the middle of the eighteenth century their operations were not carried on with exactness sufficient to render their conclusions of much value. Since that time, however, geodesy has progressed so rapidly, owing to the invention of more accurate instruments and the discovery of new methods, that the measurement of the meridian can now be performed with very high precision. The *modus operandi* is as follows: two stations, having nearly the same longitude, are chosen; their latitude and longitude are accurately determined (the error of a single second in latitude introduces a considerable error into the result) and the direction of the meridian to be measured ascertained; then a base line is measured with the greatest accuracy, as an error here generally becomes increased at every subsequent step; and then, by the method known as triangulation (q.v.), the length of the arc of the meridian contained between the parallels of latitude of the two stations is ascertained. As the previously found latitudes of its two extremities give the number of degrees it contains, the average length of a degree of this arc can be at once determined and also, on certain assumptions as to the earth's form, the length of the whole meridional circumference of the earth. This operation of meridian measurement has been

performed at different times on a great many arcs lying between lat. 68° N. and lat. 38° S., and the results show a steady though irregular increase in the length of the degree of latitude as the latitude increases. On the supposition that the law of increase holds good to the poles the length of every tenth degree of latitude up to 70° is as follows:

DEGREE OF LATITUDE	Length of degree in English feet
0°	362,756
10°	362,868
20°	363,188
30°	363,679
40°	364,284
50°	364,929
60°	365,536
70°	366,033

This table is calculated on the theory that the earth is not spherical, as in that case the length of all degrees of latitude would be alike, but of a more or less spheroidal form, i.e., having its curvature becoming less and less as we go from the extremity of its greater or equatorial diameter to the lesser or polar axis. See EARTH; DEGREE OF LATITUDE.

Meridional Parts. In preparing a chart (q.v.) upon Mercator's projection, in order to preserve the relative proportion between the lengths of meridians and parallels at any point the former must be increased in length. The lengths of small portions of the meridians thus increased are called *meridional parts*, and tables giving the lengths at different latitudes are prepared for use in constructing charts.

MERIGI DA CARAVAGGIO. See CARAVAGGIO, MICHELANGELO MERISI DA.

MÉRIMÉE, mǎ'rě'mǎ', PROSPER (1803-70). A French novelist, historian, dramatist, and critic, born in Paris, Sept. 28, 1803. He studied law, which he never practiced; he held various offices in the civil service, became, in 1831, inspector of archæological and historical monuments of France, an Academician in 1844, and a Senator of the Empire in 1853. His reports of professional researches were the basis of four volumes: *Dans le midi de la France* (1835); *Dans l'Ouest* (1836); *En Auvergne et Limousin* (1838); *En Corse* (1840). To archæology he contributed also *Monuments historiques* (1843); *Peintures de l'Eglise Saint-Savin* (1844); and to history a monograph on *Don Pedro de Castille* (1843), *Les faux Démétrius* (1854), and a volume of miscellaneous *Essais* (1855). He is best known, however, for his fiction, narrative and dramatic, *Théâtre de Clara Gazul* (1825), a pretended translation from the Spanish and an ironical toying with romanticism; *La Guzla* (1827), a pretended translation of Illyrian songs; *La Jacquerie* (1828), dramatic scenes from the Peasants' War of 1358; a similar but far finer historic study, *La chronique du règne de Charles IX* (1829), of which the Massacre of St. Bartholomew forms the central scene; *Colomba* (1840), his most popular novel, a story of Corsica; *Carmen* (1847), a Spanish gypsy romance and subject of a popular opera by Bizet; and three volumes of short stories of remarkable polish and artistic effect, but hard, ironical, and sometimes cynically pessimistic. Mérimée was, before Maupassant, an unapproached master of stylistic restraint and con-

cision. He chooses exotic scenes, a material and moral life alike foreign to his readers, but he never fails to produce the illusion of reality even when he crosses the border of the supernatural. Although impassive in his writing, Mérimée was in private life characterized by tender and devoted friendships, of which his *Lettres à une inconnue* (1873), translated in the "Bric à Brac Series," edited by Stoddard, vol. 111, New York, 1874; the *Lettres à une autre inconnue* (1875); the *Lettres à Panizzi* (1881); and *Une correspondance inédite* (1896), are most interesting and beautiful monuments. They show Mérimée gracious, affectionate, loyal, capable of even a romantic idealism. Mérimée died at Cannes, Sept. 23, 1870. Consult: *Writings of Prosper Mérimée, with Essay on the Genius and Achievement of the Author*, by George Saintsbury (8 vols., New York, 1905 et seq.); also Tourneux, *Prosper Mérimée, ses portraits, ses dessins, etc.* (Paris, 1879); Haussonville, *Mérimée* (ib., 1888); Augustin Filon, *Mérimée et ses amis* (ib., 1894); id., *Mérimée* (ib., 1898); F. Chambon, *Notes sur Mérimée* (ib., 1903); L. Pinvert, *Sur Mérimée* (ib., 1908); also W. H. Pater, in *Studies in European Literature* (Oxford, 1900).

MERINO, me-rě'nó. See SHEEP.

MERIONETH. A county of Wales, bounded west by Cardigan Bay and north by the counties of Carnarvon and Denbigh (Map: Wales, C 4). Area, 660 square miles. Its coast line is generally rugged. Merioneth is the most mountainous county in Wales, with valley, cliff, and lake alternating. The highest point is less than 3000 feet. Large tracts are unfit for profitable cultivation. Slate and limestone are largely quarried, and lead, copper, and manganese are mined. Woolens and flannels are manufactured. Capital, Dolgelly (q.v.). Pop., 1901, 48,852; 1911, 45,565.

MERISTEM (irregular formation from Gk. μεριστός, *meristos*, divided, from μερίζω, *merizein*, to divide, from μέρος, *meros*, part). A general name applied in the anatomy of plants to actively dividing tissue. For example, in most stems meristem occurs at the apex and gives rise to the stem tissues. In stems which increase annually in diameter there is a very characteristic meristem, called cambium (q.v.), that produces the wood elements. A young organ, such as a leaf which is developing, is usually completely meristematic. The contrasting term to "meristematic tissue" is "permanent tissue." See HISTOLOGY.

MERIT, ORDER OF. An order instituted in London, June 26, 1902, by King Edward VII, with the object of conferring distinction on persons who have gained prominence in military, scientific, artistic, and professional services. The order consists of the sovereign and the members and is not conferred as a reward for political services. Initials of the order are accorded precedence immediately after those of the Bath and before the other orders of knighthood. On Jan. 1, 1915, there were 15 members, comprising, as representative of the army, Earl Kitchener; of the navy, Admirals Seymour and Wilson and Lord Fisher; of science, Lord Raleigh, Sir William Crookes, Sir Archibald Geikie, and Sir Joseph J. Thomson; of literature and history, Viscount Bryce, Viscount Morley, Lord Cromer, Thomas Hardy, Sir George Trevelyan, and Prof. Henry Jackson; of music, Sir Edward Elgar. Honorary members of the order were

Marquis Yamagata, Marquis Oyama, and Admiral Count Togo.

MERIT SYSTEM, THE. In the United States the merit system looks towards the appointment of men to office because of their competency and not because of their political opinions. The fitness of the candidate is determined by his ability to pass a written competitive examination given by a commission of examiners. The answers submitted by candidates must be unsigned, so as to obviate the possibility of favoritism on the part of the examiners. A list is made of the successful candidates, arranged in the order of their merit as shown by the results of the examination. Appointments must be made from this eligible list in the order of rank unless good cause can be shown why one of higher rank should be set aside for one standing lower on the list. A common objection to the merit system is that it does not give an adequate test of a man's real capacity to administer the office to which he seeks appointment. This is in a measure true, though more and more the civil-service examiners are coming to lay stress upon experience and practical knowledge. Inasmuch as the merit system makes it more difficult for the ordinary political heeler to secure lucrative offices because of his vote-getting ability, the system must be recognized as a power for good. Though it does not inevitably lead to the choice of the most competent, it does very effectually exclude the absolutely unfit. The existence of a merit system has exerted a considerable influence even upon what are still legally political appointments. Considerations of fitness play a far more important part than formerly in determining appointments to responsible positions, especially in the larger cities. See CIVIL-SERVICE REFORM.

MERIVALE, mēr'i-vål, CHARLES (1808-93). An English historian, best known by his work on the Roman Empire. He was born March 8, 1808, the son of John Herman Merivale, a well-known minor poet. He was educated at Harrow, Haileybury College, and St. John's College, Cambridge. He took his degree at the latter place in 1830, and was successively scholar, fellow, and tutor. During all this time he was interested especially in Roman history, and between 1850 and 1864 wrote his well-known *History of the Romans under the Empire*, which deals with the period between the rise of the Gracchi and the death of Marcus Aurelius. The first part of the work was especially popular and was published in popular form under the title of *The Fall of the Roman Republic*. The merit of this history was great in its day, but more recent investigation, especially the study of epigraphy, has controverted many of Merivale's views. In 1869, after declining an appointment to the professorship of modern history at Cambridge, he became dean of Ely, though he had only a slight interest in strictly ecclesiastical questions and disputes. He continued to publish various studies on Roman history, among which may be noted *General History of Rome from the Foundation of the City to the Fall of Augustus* (1875). In 1862 he very successfully translated Keats's *Hyperion* into Latin verse. He died Dec. 27, 1893. Consult *Autobiography and Letters*, edited by his daughter, Judith Anne Merivale (London, 1899).

MERIVALE, HERMAN (1806-74). An English economist and administrator, born at Dawlish, Devonshire. He was a brother of Charles

Merivale, the historian, studied at Harrow, and graduated at Trinity College, Oxford, in 1827. In 1832 he was called to the bar of the Inner Temple. From 1837 to 1842 he was professor of political economy at Oxford, delivering while there a valuable series of *Lectures on Colonization and the Colonies* (2 vols., 1841-42). Appointed Assistant Undersecretary of State for the Colonies in 1847, he became permanent Undersecretary in 1848. He was transferred in 1859 to the undersecretaryship for India and continued in that office until his death. His further works—none of his books, it is said, well represents him—include *Historical Studies* (1865); *Memoirs of Sir Philip Francis* (1867); the second volume of a *Life of Sir Henry Lawrence* (1872).

MERIVALE, JOHN HERMAN (1779-1844). An English scholar, translator, and poet. He was born in Exeter, studied at St. John's College, Cambridge, and was called to the bar in 1804. He contributed largely to Bland's *Collections from the Greek Anthology*, published in 1813, and himself brought out a second edition in 1833. From 1831 to his death he held the office of Commissioner of Bankruptcy. Among his further literary works may be mentioned *Poems, Original and Translated* (1841) and *Minor Poems of Schiller* (1844). He was the father of Charles and Herman Merivale.

MERIWETHER, LEE (1862-). An American lawyer and author, born at Columbus, Miss. He was educated at Memphis, Tenn., studied law, and practiced his profession at St. Louis. The Secretary of the Interior appointed him, after he had taken a tramp trip across Europe in 1885-86, to write a report on the condition of the laboring classes in Europe. Subsequently, as a special agent of the Department of the Interior, he was active in collecting statistics regarding labor in the Hawaiian Islands and the United States. This post he resigned to accept that of Labor Commissioner of Missouri. He made himself known by his report on the corporation (or "truck") store system, by which miners in Missouri were provided with supplies, at exorbitant figures, as a substitute for the regular wages, and he introduced into the Legislature of the State a bill which put an end to this system. Later he studied European prisons, and upon his return to the United States resumed the practice of law in St. Louis. He was the candidate of the Public Ownership party for mayor of St. Louis in 1901 and 1905. His publications include: *A Tramp Trip: How to See Europe on Fifty Cents a Day* (1887), describing a pedestrian journey taken by him from Gibraltar to the Bosphorus in 1885-86; *The Tramp at Home* (1889); *Afloat and Ashore on the Mediterranean* (1892); *Miss Chunk* (1899); *A Lord's Courtship* (1900); *Seeing Europe by Automobile* (1911).

MERKEL, mēr'kel, ADOLF (1836-96). A German jurist and criminologist, born in Mainz and educated at Giessen and Heidelberg. He became docent at Giessen in 1862 and professor in 1867, and was successively appointed professor at Graz (1868), at Vienna (1872), and at Strassburg (1874). He contributed largely to Holtzendorff's *Handbuch des deutschen Strafrechts* and *Encyklopädie der Rechtswissenschaft* and wrote *Zur Lehre vom fortgesetzten Verbrechen* (1862); *Kriminalistische Abhandlungen* (1867); *Juristische Encyklopädie* (1885; 3d ed., by R. Merkel, 1904); *Lehrbuch des deutschen Straf-*

rechts (1889); *Vergeltungs-idee und Zweckgedanke im Strafrecht* (1892); and other essays on criminal law.

MERLE, mērl (OF., Fr. *merle*, from Lat. *merula*, blackbird). The common European blackbird (*Turdus merula*), a thrush closely allied to the American robin, the male of which is uniformly black, while the female is dusky olive brown above and reddish brown below. The species is migratory except on the borders of the Mediterranean, and is one of the most familiar of the summer birds of Europe, coming about all gardens and roadsides and making its rude nest in bushes and hedgerows. The eggs are bluish green freckled with brown. This is one of the finest of European songsters and is frequently kept in cages and aviaries. The genus is a large one, with numerous species in the Orient, Australia, and South America. Compare BLACKBIRD; THRUSH.

MERLE D'AUBIGNÉ, mārł dō'bē'nyā', JEAN HENRI (1794-1872). A Swiss historian. He was born at Eaux-Vives, a suburb of Geneva, in Switzerland, Aug. 16, 1794; studied there and at Berlin, and in 1818 became pastor of the French Protestant Church in Hamburg. Thence, after a residence of five years, he proceeded to Brussels. In 1831 he returned to Geneva and took part in the institution of a new college for the propagation of orthodox theology, in which he was appointed professor of Church history. His *Histoire de la réformation au seizième siècle* gave him a wide reputation and has been translated into many languages. It is, however, marred by partisanship and uncritical use of authorities. The first part, that on the Reformation in the time of Luther (4 vols., Paris, 1835-47; best ed. of the Eng. trans., 5 vols., Edinburgh, 1853, the last volume on the English Reformation), was vastly more popular than the second part, that on the Reformation in the time of Calvin (8 vols., 1862-78; Eng. trans., 8 vols., London, 1863-78). His other writings, mostly historical, are of less account. He died at Geneva, Oct. 21, 1872. Consult his *Life* by Bonnet (Paris, 1874).

MERLET, mār'lā', LUCIEN VICTOR CLAUDE (1827-98). A French antiquary, born at Vannes. He studied paleography and in 1851 became head of the departmental archives of Eure-et-Loir. He edited many chartularies and ecclesiastical registers and published: *Histoire des relations des Hurons et des Abnauquis du Canada avec Notre-Dame de Chartres* (1858); *Robert de Gallardon: scènes de la vie féodale au XIIIème siècle* (1858); *Dictionnaire topographique du département d'Eure-et-Loir* (1861); *De l'instruction primaire en Eure-et-Loir avant 1789* (1878); *Dictionnaire des noms vulgaires des habitants de diverses localités de la France* (1883); *Poètes de la région antérieure au XIXe siècle* (1894); *Inventaire sommaire des archives départementales d'Eure-et-Loir* (1894); *Dalles tumulaires et pierres tombales du département d'Eure-et-Loir* (1895); *Cartulaire de l'abbaye de la Madeleine de Châteaudun* (1896); *Dignitaires de l'église Notre Dame de Chartres* (1901).

MERLIN. An opera by Goldmark (q.v.), first produced in Vienna, Nov. 19, 1886; in the United States, Jan. 3, 1887 (New York).

MERLIN. The name of an ancient British prophet and magician who flourished, according to the romancers, during the decline of the native British power in its contest with the Saxon invaders. The earliest traces of him are found

in the *Historia Britonum*, ascribed to a certain Nennius (about 800). He there appears as a prophetic child under the name Ambrosius, and is confounded with Aurelius Ambrosius, to whom Vortigern surrenders Mount Heremus (Snowdon). He next appears in Geoffrey of Monmouth's *Vita Merlini*, afterward incorporated in the *Historia Regum Britanniae* (about 1139), where he is called Merlin Ambrosius, or simply Merlin. Geoffrey expanded the narrative of Nennius, evidently employing for the purpose traditions concerning a Cambrian or Welsh bard known in Welsh legend as Myrddin. According to Geoffrey, Merlin lived in the fifth century and was sprung from the intercourse of a demon and a Welsh princess. Merlin displayed miraculous powers from infancy. He is made to predict the history of Britain down to Geoffrey's own time. From Geoffrey and other sources was built up the French prose romance of Merlin (thirteenth century). Versions of this romance were made in Italian, Spanish, German, and English; and parts of it were embodied in Malory's *Morte d'Arthur* (1485). A collection of prophecies attributed to him appeared in French (Paris, 1498), in English (London, 1529 and 1533), and in Latin (Venice, 1554), and their existence is traceable as far back as the thirteenth century. Besides this Cambrian Merlin (Merlin Ambrosius) there is the Strathclyde Merlin, called Merlin the Wyllt, or Merlin Caledonius. He is supposed to have lived in the sixth century, a contemporary of St. Kentigern, Bishop of Glasgow. His grave is still shown at Drummelzier on the Tweed, where, in attempting to escape across the river from a band of hostile rustics, he was impaled on a hidden stake. A metrical life of him, extending to more than 1500 lines, professedly based on Armoric materials, and incorrectly ascribed to Geoffrey of Monmouth, was published by the Roxburghe Club in 1833. His prophecies, published at Edinburgh in 1615, contain those ascribed to the Cambrian Merlin.

Bibliography. Geoffrey of Monmouth, *Historia Regum Britanniae*, edited by A. Schulz (Halle, 1854); *Merlin, roman en prose du XIIIème siècle*, edited by Paris and Ulrich, Société des Anciens Textes (Paris, 1886); *Merlin, or the Early History of King Arthur: A Prose Romance* (about 1450-60), edited by Wheatley, Early English Text Society (London, 1865-99); Child, *The Book of Merlin* (New York, 1904); E. A. Kock, *Merlin: A Middle-English Metrical Version of a French Romance* by Herry Lovelich (2 vols., London, 1904-13); Brugger, *Mitteilungen aus Handschriften der altfranzösischen prosaromane Joseph und Merlin* (Berlin, 1909); also Thomas Malory, *Morte d'Arthur*; a good edition is by Edward Strachey (New York, 1907); Tennyson, *Idylls of the King* (ib., 1911).

MERLIN (OF. *esmerillon*, *emerillon*, Fr. *émerillon*, *merlin*, augmentative form from ML. *smerrillus*, *smerrus*, *merlin*, probably from Lat. *merula*, blackbird). The smallest of Old World falcons (*Falco aesalon*, or *regulus*), scarcely exceeding a blackbird in size, but very bold and powerful. It is bluish ash in color above, reddish yellow on the breast and belly, with longitudinal dark spots, the throat of the adult male white. It builds its nest on the ground and is fond of localities where large stones are plentiful, whence it is often called stone falcon. It is common in most parts of Europe, Asia, and

Africa, and was of great repute in the days of falconry. The merlin is represented in North America by the pigeon hawk (q.v.).

MERLIN, mēr'lān', ANTOINE CHRISTOPHE (1762-1833). A French revolutionist, born at Thionville. He studied theology and law and became an advocate at the parlement of Metz in 1788. He was sent as a deputy for Moselle to the Legislative Assembly of 1791, and in that body upheld the confiscation of the property of the émigrés and urged the execution of Louis XVI. He was elected to the National Convention in 1792, and, sent in the same year to defend Mainz, accomplished his task with notable success. He participated in the reaction against his former colleagues, the Jacobins; and under the Directory he sat in the Council of Five Hundred until 1798. He then became Director General of Posts, but lived in retirement under the Consulate and the Empire. He is often referred to in French history as Merlin of Thionville to distinguish him from Merlin de Douai (q.v.), with whom he was closely associated.

MERLIN COCCAI, mēr-lēn' kō-kāy', pseudonym of TEOFILO FOLONGO (1491-1544). Greatest of Italian macaronic poets. At the age of 18 he became a member of the Benedictine Order, and while a monk he wrote Latin verses in the style of Vergil. About 1515 he forsook monastic life and wandered about the country with a young woman of good family, Girolama Dieda, often in great poverty, for he had no resource but his poetic talent. His first publication was the mock heroic *Baldus* (Venice, 1517 and 1521), written in macaronic verse (q.v.), which Folongo was the first to use with genius. Specimens of macaronic poetry are found in England in the thirteenth century (*Carmina Burana*), in the French *Roman de Renard* (thirteenth century), and in a German Goliardic poem of the fifteenth. It occurs frequently in the French farces of the fifteenth century (in parodies of church sermons), which, like the French epics, were popular in Italy. From Padua, in fact, in 1490, came the *Macaronea* of Tifi Odasi (Michele di Bartolomeo degli Odasi), a rippling satire of local types, which, giving this culinary name to poetry of the kind, had an immediate following. The anonymous *Nobile Vigonze Opus* (1494) is likewise of Padua and directly from the university. Of the same year is the *Virgiliana* of Fossa da Cremona, which was followed (1499) by the political invectives of Bassano da Mantua and Giovan Giorgio Alione d'Asti. In 1505 Serafino Buffone addressed a macaronic epistle to Isabella d'Este. Marin Sanudo cites some macaronic hexameters from as early as 1483. From this rich tradition Folongo drew the inspiration and the method for his famous *Baldus*, which probably influenced Rabelais in his creation of Pantagruel, and which, as a satire of the chivalric romance, is a predecessor of Cervantes' *Don Quixote*. A serious artistic and moral purpose guides Folongo not only here but in his following *Zanitonella*, *Orlandino*, and *Moschea*. He reduced his Latinization of a curious jargon composed of Venetian, Bergamasque, and Tuscan elements to rules in the *Normula Macaronica de Sillis*. His *Chaos del triperuno* is, historically, more interesting still from its curious portrayal of the confused state of mind of the time in the midst of conflicting religious and scientific tendencies. Folongo issued from it about 1527 with a chastened spirit and, resuming monastic life, seems

to have devoted the rest of his days to the production of religious works, such as the *Palermiana a umanità di Cristo* and the play *Atto della pinta*. Among the many imitators of Folongo the most important is Cesare Orsini of the following century (*Capriccia macaronica*, Venice, 1638). Consult *Works*, edited by Renier-Luzio (4 vols., Bari, 1911), and relative articles in *Giornale Storico della Letteratura Italiana* (Turin, 1911-12).

MERLIN DE DOUAI, mār'lān' de dōā', PHILIPPE ANTOINE, COUNT (1754-1838). A French politician and jurist. He was born at Arleux and studied at the College of Anchin. He began his career by practicing law at Douai. In 1775 he became advocate at the parlement of Flanders, where he soon acquired reputation as an able lawyer. His frequent contributions to the law dictionary, of which he finally became the editor (5th ed., 1827-30), then appearing under the title *Répertoire universel de jurisprudence*, increased his reputation and established his authority as a juriconsult. After the outbreak of the Revolution he was elected a member of the National Assembly (1789), where he attracted much attention by his report on the bill of April 4, 1789, abolishing the feudal system. In 1795 he became Minister of Justice and kept this post till Jan. 18, 1799. After the coup d'état of the 18th Brumaire he took the office of procureur général at the Court of Cassation (1801), and Napoleon made him Councilor of State in 1808, and two years afterward created him Count and Grand Officer of the Legion of Honor. By a royal ordinance of July 24, 1815, he was expelled from France and resided in Belgium and Holland. On his return to France in 1830 he became a member of the Academy of Moral and Political Science. He is the author of *Recueil alphabétique des questions de droit qui se présentent le plus fréquemment dans les tribunaux* (4th ed., 1827-28).

MER/LON (Fr. *merlon*, It. *merlo*; perhaps connected with Lat. *mærus*, *murus*, wall). In fortification, the portion of the parapet between two embrasures.

MER/MAID (from *mere*, AS. *mere*, Goth. *marci*, OHG. *mari*, Ger. *Meer*, OIr., Gael. *muir*, OChurch Slav. *morye*, Lat. *mare*, sea + *maid*, AS. *mægþ*, Goth. *magapþ*, OHG. *magad*, Ger. *Magd*, *maid*). An imaginary inhabitant of the sea. The upper parts of mermaids are represented as resembling those of beautiful women, while the body terminates in a tail like that of a fish. The *merman* is also heard of, but less frequently. The commonest representation of the mermaid pictures her as holding in her hand a mirror, while in the act of combing her hair. There is an evident affinity between the stories concerning mermaids and those concerning the sirens and tritons, perhaps also the nereids, of the ancients. All these stories may have had their origin in the play of the imagination about such sea creatures as seals and walruses dimly or distantly seen.

MERMAID, THE. A famous London club, the foundation of which is ascribed to Sir Walter Raleigh. Its members included Jonson, Beaumont, Fletcher, Selden, and Carew. Shakespeare also is said to have belonged to it. The meeting place was the old Mermaid Tavern on Bread Street.

MERMAID'S GLOVE. A local English name applied to a sponge (*Halichondria oculata*) often cast ashore on the coast of Great Britain

and northeastern America. Its branches are somewhat finger-shaped, giving to the entire animal a rude glove-like appearance. The name is also given to a social polyp, *Aleyonium digitatum*, more aptly and commonly called dead-man's-fingers.

MERMAID'S HEAD. The popular British name for a spatangoid sea urchin (*Amphidetus cordatus*).

MERMAID'S PURSE. A shark's egg case. See RAY.

MERMET, mër'má', JOSEPH (?1783-1836). A Canadian poet. He was born in France, was educated to be a soldier, and in 1813 went to Canada as lieutenant and adjutant of the well-known De Watteville regiment, made up chiefly of Swiss officers and soldiers. This regiment did notable service on the British side in the War of 1812. Mermet was for a time stationed at Kingston, Upper Canada, and while there wrote a considerable part of his poetry. His chief themes were inspired by the war, and especially the exploits of Colonel de Salaberry, the victor of Châteauguay. He afterward traveled through Canada and wrote poetic descriptions of its scenery. He was the first Canadian poet to choose Niagara Falls as a subject. In 1816 he returned to France. Mermet, though not a poet of great distinction, had considerable influence in stimulating the ambitions of the French-Canadian writers in the early part of the nineteenth century. Much of his verse had a light, satirical vein. His poems were published in *Le Spectateur* of Montreal.

MERMILLOD, mër'mě'lô', GASPARD (1824-92). A Swiss Roman Catholic prelate, whose ecclesiastical history is largely the story of the quarrel between the radical government of Geneva in the seventies and the holy see. He was born in Carouge, studied in a Jesuit college at Freiburg, and took holy orders in 1847. He was an impassioned orator and a leader of the Ultramontanists, in whose behalf he founded *L'Observateur Catholique* and the *Annales Catholiques*. In 1857 he was appointed vicar-general of Geneva and in 1864 received full episcopal powers in the canton. In the struggle precipitated by this action the Genevan government exiled him in 1873. An attempt on the Pope's part in 1879 to restore him was unsuccessful, as the brief forming the Canton of Geneva into an apostolic vicarate was still in force; but in 1883 Mermillood was appointed Bishop of Lausanne and Geneva, and the distasteful title was thus abrogated and the decree of exile consequently withdrawn. He was made Cardinal in 1890. In 1885 he founded the Union Catholique d'Etudes Sociales et Economiques. His best-known work is *Lettres à un Protestant sur l'autorité de l'église et le schisme* (1860). His collected works, sermons, lives of the saints, and political pamphlets were published in Paris and Lyons in 1893. Consult Lesur and Bournand, *Le Cardinal Mermillood* (Abbeville, 1895).

MERNEPTAH. See MENEPTAH.

MERÖ, märe', YOLANDA (1887-). A Hungarian pianist, born at Budapest. Her first instruction she received from her father, after which she completed her pianistic studies with Madame Rennebaum, a pupil of Liszt. Twice, in 1900 and 1902, she won musical scholarships from the Minister of Education. Her début occurred at Dresden in 1904, with gratifying success. She then made tours of Germany, France, Holland, and England. At her Amer-

ican début, in 1909, with the Russian Symphony Orchestra, she made such a decided impression that she was immediately engaged by the great symphony orchestras of the country. Her playing is characterized by warmth and brilliancy. In 1909 she was married to Herman Irion, of New York.

MERODACH, mër'ô-däk. The Hebrew pronunciation of the name of Marduk, or Maruduk, the great Babylonian god. It occurs in Jer. i. 2, in the proper names Merodach Baladan, which stands for Marduk apal iddin, and Evil Merodach, which represents Amil Marduk, and probably also in Mordecai in the Book of Esther. The same god is clearly intended in Isa. xlv. 1, Jer. li. 44, where Bel is used, and also in the deutero-canonical fragment Bel and the Dragon (q.v.).

MÉRODE, märe'ôd', FRANÇOIS XAVIER MARIE FRÉDÉRIC GHISLAIN, COUNT DE (1820-74). A Roman Catholic prelate. He was born at Brussels, a grandnephew of Lafayette. He entered the Belgian army and took part in the Algerian campaign. In 1847 he began the study of theology at Rome, where he was ordained to the priesthood in 1850. Pius IX made him his chamberlain and canon of St. Peter's. In 1860 he was appointed temporary Minister of War and recruited, chiefly from foreigners, a Pontifical army. In 1865 he went out of office in consequence of a dispute with Cardinal Antonelli. The next year he was made Archbishop of Mytilene and Papal Almoner. In 1869 he resisted the declaration of the doctrine of papal infallibility, but he acquiesced in the final enunciation of it by the Ecumenical Council. Consult his *Life* by Lamy (Louvain, 1874) and by Besson (Paris, 1886).

MERO DE ALTO. See JEW FISH.

MEROË, mër'ô-ē (Lat., from Gk. Μερών). The second capital of ancient Ethiopia (q.v.), dominant from the reign of King Ergamenes (c.250 B.C.), and the only residence of the kings after the downfall of Napata (q.v.). As Berua it is mentioned as early as 500 B.C.; the extensive ruins (described by Cailliaud, and finely illustrated in Lepsius, *Denkmäler*, part v) are situated at a place now called Begerawieh. Consult: Cailliaud, *Voyage à Meroë* (Paris, 1823-27); Lepsius, *Letters from Egypt, Ethiopia, and the Peninsula of Sinai* (London, 1853); Budge, *The Egyptian Sudan* (ib., 1907).

MER'OM, WATERS OF. The scene of the great battle between the Hebrews under Joshua and the allied kings of Canaan (Josh. xi.). The Waters of Merom have been identified with the more northern of the two lakes through which the Jordan flows in its course to the Dead Sea. This lake is now called Huleh, or more fully Baheiret el Huleh (the little lake of Huleh). It is triangular in shape; at its base, towards the north, the Jordan enters and flows out again from its apex towards the south on its descent to the Sea of Galilee. The falling rains and melting snows periodically increase its size, but its average length is about 3½ miles and its width at the broadest point about 3; its depth is 10 to 16 feet. Schmidt supposes that we should read Merom for Darom in Deut. xxxiii. 23, since Naphtali had nothing to do with Darom (the south), while it seems to have possessed the places on Lake Merom. Josephus calls the lake Semehonitis (*Wars*, iii-x, 7), and the region about it Ulatha (*Ant.* xv, 10, 3).

The district, which is very fertile, is inhabited by Arabs. Consult: Macgregor, *The Rob Roy on the Jordan* (New York, 1870); G. A. Smith, *Historical Geography of the Holy Land* (London, 1895); Schmidt, *The Messages of the Poets* (New York, 1911).

MEROPE, mēr'ō-pē. 1. A sister of Phaëthon and one of the Heliades. 2. One of the Pleiades, the wife of Sisyphus and mother of Glaucus. She hid her light for shame because she had married a mortal. (See LOST PLEIAD, 1.) 3. The daughter of Cypselus and wife of the Mes-senian King Cresphontes. All her sons except Æpytus were killed when her brother-in-law, Polyphontes, seized the kingdom. Æpytus fled, and when he had grown up returned and put Polyphontes to death and regained the sovereignty.

MÉROPE, mǎ'rōp'. A tragedy by Voltaire (1743).

MEROP'ODA (Neo-Lat., from Gk. μέρος, meros, a part, a segment + ποῦς, ποδός, pous, podos, a foot). The name given by Packard to a phylum or general group of arthropodous animals comprising three classes, i.e., the diplopod Myriapoda (q.v.), or thousand legs, the Pauropoda, and the Symphyla. It is equivalent to the *Tracheata progoneata* of Pocock. In the typical forms (Diplopoda) the second pair of mouth appendages, corresponding to the mandibles of insects, are very different in structure and composed of three segments, since all the head and thoracic appendages are made up of several joints; hence the name *Meropoda*, or jointed legs. In this phylum all the forms agree in having the genital outlets situated a little behind the head; i.e., in diplopods and pauropods in the third segment behind the head, while in the Symphyla (*Scolopendrella*) the single opening is in the fourth segment from the head. The young on hatching differ from those of centipedes (Chilopoda) in having but three pairs of legs, but, unlike those of insects, either the third or the second trunk segment in diplopods is footless. See CENTIPEDE; MYRIAPODA.

MER'OSTOM'ATA (Neo-Lat. nom. pl., from Gk. μέρος, meros, part + στόμα, stoma, mouth). A class of Arthropoda, standing next above the Trilobita and immediately below the Arachnida, these three classes forming a series by themselves and distinct from the Crustacea. They are represented by the king crab (q.v.), or *Limulus*, the sole surviving member of the class. The merostomes are subdivided into three orders: the Eurypterida, represented by *Eurypterus*; the Synziphosura, of which three Paleozoic families are the types; and, third, the Xiphosura, type *Limulus*. The class chiefly differs from Trilobita in having appendages of two types, those of the head being single, those of the abdomen being biramous; in being provided with book gills, attached to the broad abdominal legs, which are fused together at the base, the head appendages often ending in a forceps, while they differ from the Arachnida in breathing by gills, all the forms being marine, in the nature of the appendages, the brain, the nervous cord enveloped by arteries, and by the reproductive organs. The earliest forms are the Eurypterida. The typical genus *Eurypterus*, unlike the king crab, probably swam actively nearer the surface of the sea. The species are found fossil in rocks of Cambrian to Permian age. The form of the body is somewhat like that of a scorpion, though flatter and of larger

size. A quadrate headpiece or cephalothorax with rounded front corners bears two large reniform compound eyes, between which are two small eye spots or ocelli. The abdominal portion consists of 12 segments that taper posteriorly and are terminated by a strong, sharp spine or telson. The structure of the ventral surface of the body is quite similar to that of the horseshoe crab.

The eurypterids appeared first in the Potosi Cambrian limestones of Missouri. At the end of the Silurian period geographic conditions seem to have favored their development, for they expanded rapidly and became the dominant types of the fauna of the inclosed basins in which were deposited the shallow-water passage beds between the Silurian and Devonian formations. They appear in great numbers in the water limestones or cement rocks of New York State, and in beds of equivalent age and similar character in Great Britain and the Baltic Provinces; also in the coal measures of Carboniferous age in Pennsylvania, Nova Scotia, and in Europe, where they are associated with the fossil remains of a swamp fauna and flora. The last member of the genus is known from Permian fresh-water beds of Portugal. The genus seems to have been first a marine shallow-water organism and to have changed its habitat through brackish and possibly to fresh water in succeeding geological periods. Several allied genera are found associated with the remains of *Eurypterus*; of these *Pterygotus*, *Stimonia*, and *Stylonurus* are the most important. See the articles KING CRAB; XIPHOSURA.

Packard, "On the Carboniferous Xiphosurous Fauna of North America," in the *Memoirs of the National Academy of Sciences*, vol. iii (Washington, 1886); K. A. von Zittel, *Text-Book of Paleontology*, translated by C. R. Eastman (New York, 1900); with the writings of De Kay, Hall, Huxley, Salter, Peach, and Laurie.

MER'OVIN'GIANS. The first dynasty of the Frankish kings in Gaul. The name is derived from Meroveus, or Merovech, the reputed grandfather of the great Frankish King Clovis (q.v.), who in 486 put an end to the Roman dominion in Gaul. Clovis on his death divided his Kingdom among his four sons, one of whom, Clotaire I, reunited them under his own sway in 558. On his death in 561 the Kingdom was again divided into four parts—Aquitaine, Burgundy, Neustria, and Austrasia. His grandson, Clotaire II, again reunited them in 613. Later there were again three states, Neustria, Austrasia, and Burgundy, which were united in 687. The power of the Merovingian kings was finally reduced to a shadow, the real power having passed into the hands of the major domus (q.v.). The dynasty of the Merovingians terminated with the deposition of Childeric III by Pepin

EURYPTERUS FISCHERI.

the Short (q.v.) in 751 and gave place to that of the Carolingians (q.v.). (See FRANKS.) The chief authority of the earlier parts of the history of the Merovingians is Gregory of Tours. Consult: Thierry, *Récits des temps mérovingiens* (2d ed., Paris, 1887); Havet, *Questions Mérovingiennes* (2d ed., ib., 1896); Pron, *La Gaule Mérovingienne* (ib., 1897); Sergeant, *The Franks* (New York, 1898); Marignan, *Etudes sur la civilisation Française*, vol. i (Paris, 1899).

MERRIAM, AUGUSTUS CHAPMAN (1843-95). An American classical scholar, born at Locust Grove, N. Y. In 1866 he graduated with the highest honors from Columbia College, and from 1868 until his death he was connected with his alma mater as tutor, adjunct professor of Greek, and professor of Greek archaeology and epigraphy. He was the pioneer in the study of classical archaeology in the United States. In 1886 he served as president of the American Philological Association. He was director of the American School of Classical Studies at Athens in 1887-88, during which year important excavations were carried on at Icaria (q.v.). He died while on a visit to Athens and was buried there. His chief publications are: *The Phæaciens of Homer* (New York, 1880); *The Greek and Latin Inscriptions on the Obelisk Crab in Central Park* (1883); *The Sixth and Seventh Books of Herodotus* (New York, 1885); *The Law Code of Gortyna in Crete* (ib., 1886); "Telegraphy among the Ancients," in *Papers of the Archaeological Institute of America: Classical Series III* (Cambridge, 1890).

MERRIAM, CLINTON HART (1855-). An American biologist, born in New York City and educated at Sheffield Scientific School of Yale (1877) and at the College of Physicians and Surgeons (Columbia), where he graduated in 1879. He served as naturalist to the Hayden Survey in 1872, was appointed assistant of the United States Fish Commission in 1875, and acted as one of the Bering Sea commissioners in 1891 and as head of various expeditions. From 1885 to 1910 he was chief of the Biological Survey, which he developed as a bureau of the United States Department of Agriculture; and he edited a long and important series of publications relating to the fauna of North America, in the classification of which he became a leading authority. In 1910 he took charge of the biological and ethnological investigations carried on under the trust fund established by Mrs. E. H. Harriman. Among his published works are: *The Birds of Connecticut* (1877); *Mammals of the Adirondacks* (1882-84); *Biological Reconnaissance of Idaho* (1891); *Geographic Distribution of Life in North America* (1892); *Flora and Fauna of the Death Valley Expedition* (1893); *Temperature Control of Distribution of Animals and Plants* (1894); *Indian Population of California* (1905); *Totemism in California* (1908); *The Dawn of the World* (1910).

MERRIAM, FLORENCE. The maiden name of FLORENCE MERRIAM BAILEY (q.v.).

MERRIAM, HENRY CLAY (1837-1912). An American soldier, born at Houlton, Me. He graduated at Colby College, studied law, served in the Civil War in 1862 as captain in the Twentieth Maine Volunteer Infantry, resigned in 1863, and in the same year was appointed captain in the Eightieth United States colored troops. He served with colored troops from 1863 until the close of the war, was brevetted

colonel of volunteers for faithful and meritorious services during the campaign against Mobile and its defenses, and in 1865 led the final attack on Fort Blakely, Ala., with the Seventy-third United States colored infantry. For this he was awarded the Congressional Medal of Honor (1894). In 1866 he became major in the Thirty-eighth Infantry of the regular army, in 1885 colonel of the Seventh Infantry, and in 1897 brigadier general. As commander of the departments of Columbia and California in 1898 he organized and forwarded troops for the Philippines expedition. In the same year Merriam was promoted major general of volunteers. He became commander of the Department of Colorado in 1900, was retired in 1901, and in 1903 was promoted major general (retired) of the regular army. The Merriam infantry pack was invented by him.

MERRIAM, JOHN CAMPBELL (1869-). An American paleontologist. He was born at Hopkinton, Iowa, and was educated (B.S., 1887) at the University of California, to which, after studying at Munich (Ph.D., 1893), he returned to be instructor in paleontology and historical geology (1894-99), assistant professor (1899-1905), associate professor (1905-12), and professor after 1912. His papers, which deal mainly with fossil reptiles and mammals of western North America and with the historical geology of the Pacific coast region, appeared for the most part in the University of California publications.

MERRICK, FREDERICK (1810-94). An American educator, born at Wilbraham, Mass. He was educated at the Wesleyan Academy in his native town and at Wesleyan University. In his senior year he left college and became the principal of Amenia (N. Y.) Seminary, and from 1838 to 1843 he was professor of natural science in Ohio University at Athens, Ohio. Thereafter until his death 51 years later he was connected with Ohio Wesleyan University. He served the institution two years as financial agent, 15 years as professor, 13 years as president, and 21 years as emeritus professor and lecturer on natural and revealed religion. He was an Abolitionist and a contributor to the Underground Railway. Though never in charge of a parish, he was an ordained minister of the Methodist Episcopal church and a member of the Ohio conference, which he joined in 1841. He was a member of the General Conferences of 1860, 1864, and 1876. His entire property was bequeathed to Ohio Wesleyan University for the endowment of the Merrick lectureship. He was the author of *Formalism* (1865) and many fugitive poems and contributions to the religious press.

MERRILL. A city and the county seat of Lincoln Co., Wis., 225 miles by rail northwest of Milwaukee, at the junction of the Wisconsin and Prairie rivers, and on the Chicago, Milwaukee, and St. Paul Railroad (Map: Wisconsin, D 3). It has broad and well-paved streets and contains the T. B. Scott Public Library, occupying a fine building, three parks, a well-equipped high school, and handsome courthouse and city hall buildings. The surrounding country possesses valuable hardwood timber, and there are important manufacturing, producing sawed lumber, shingles, laths, sashes, doors and blinds, brooms, pails, hubs, shoes, knit goods, veneer, excelsior products, and pulp and paper. There are also some dairying interests. Excellent

water power is afforded by two large dams on the Wisconsin River. Settled in 1875, Merrill was incorporated five years later, being known as the village of Jenny until 1881, when it received its present name. The government is vested in a mayor, biennially elected, and a unicameral council. Pop., 1900, 8537; 1910, 8689; 1914 (U. S. est.), 8752.

MERRILL, ELMER TRUESDELL (1860-). An American Latin scholar, born at Millville, Mass. He graduated from Wesleyan in 1881 and pursued graduate studies at Yale, Berlin, Rome, and in England. He taught the classics at the Massachusetts State Normal School, Westfield (1882-83), and at Wesleyan (1883-86); after one year (1887-88) at the University of Southern California as professor of Latin, he returned to Wesleyan as professor of Latin language and literature (1888-1905); and for three years he held a similar chair at Trinity College, Hartford. In 1908 he became professor of Latin at the University of Chicago. He was active in the work of the American School of Classical Studies in Rome, of which he was professor (1898-99), acting chairman (1899-1900), and chairman (1900-01). After 1906 he was associate editor of *Classical Philology*, and in 1906-07 he served as president of the American Philological Association. Merrill was ordained a priest in the Protestant Episcopal church in 1895. In 1911 the University of St. Andrews gave him its LL.D. His publications include: *Poems of Catullus* (1893); *Fragments of Roman Satire* (1897); *Selected Letters of the Younger Pliny* (1903); *C. Plini Cæcili Secundi Epistularum Libri Novem* (1914). He contributed to the NEW INTERNATIONAL ENCYCLOPEDIA.

MERRILL, FREDERICK JAMES HAMILTON (1861-1916). An American geologist, born in New York City. He graduated at the Columbia School of Mines in 1885, received his Ph.D. there five years afterward, held a fellowship in geology at Columbia College (1886-90), and was assistant in the New Jersey Geological Survey (1885-89). From 1890 to 1893 he was assistant geologist for New York State. He was assistant director (1890-94) and director (1894-1904) of the New York State Museum, and was in charge of the New York exhibit at the Columbian Exposition in Chicago in 1893, at the Buffalo Exposition in 1901, and at the St. Louis Exposition in 1904. He afterward established himself in Los Angeles as a consulting mining geologist. To the bulletin of the New York State Museum he contributed *Salt and Gypsum Industries in New York* (1893); *Mineral Resources of New York* (1896); *Road Materials and Road Building in New York* (1897); *Natural History Museums of the United States and Canada* (1903).

MERRILL, GEORGE EDMANDS (1846-1908). An American Baptist clergyman and educator, born at Charlestown, Mass. After graduating at Harvard University in 1869 and at Newton Theological Institution in 1872, he was pastor of Baptist churches in Massachusetts at Springfield (1872-77), Salem (1877-85), and Newton (1890-99). Two years (1885-87) he spent at Colorado Springs. From 1899 until his death he was president of Colgate University. His writings include: *The Story of the Manuscripts* (3d ed., 1881); *Crusaders and Captives* (1890); *The Reasonable Christ* (1893); *The Parchments of the Faith* (1895); "The Songs of Solomon," in the *American Commentary on the Old Testament*

(1905). Merrill received the degree of D.D. from Colby College in 1895 and that of LL.D. from the University of Rochester in 1901.

MERRILL, GEORGE PERKINS (1854-). An American geologist, born at Auburn, Me. He was educated at the University of Maine (B.S., 1879; Ph.D., 1889), was assistant in chemistry at Wesleyan University, Connecticut (1879-80), and studied at Johns Hopkins (1886-87). In 1881 he became assistant curator at the National Museum, Washington. He also served as professor of geology and mineralogy at the Corcoran Scientific School of Columbian (now George Washington) University after 1893, and was appointed head curator of the department of geology at the National Museum in 1897. His chief publications are: *Stones for Building and Decoration* (1891; 3d ed., 1903); *A Treatise on Rocks, Rock-Weathering, and Soils* (1897; 2d ed., 1906); *The Non-Metallic Minerals* (1904; 2d ed., 1910); *The Fossil Forests of Arizona* (1911); and many periodical contributions, especially on meteorites.

MERRILL, LEWIS (1834-96). An American soldier, born at New Berlin, Pa. He studied at Lewisburg University, Pennsylvania, graduated at West Point in 1855, was assigned to duty as lieutenant with the First Dragoons, and served in Missouri, in Kansas Territory, and with the Utah expedition. In 1861, as colonel and first cavalry officer on the staff of John C. Frémont, he organized Merrill's Horse to oppose guerrillas in Missouri, and later commanded the Department of St. Louis and then that of Northern Missouri. In 1864 he was commander of the cavalry bureau at St. Louis and took part in the engagements at Franklin, Mo. The next year he was sent against guerrillas in northern Georgia and Alabama and was brevetted brigadier general. After various Western assignments he was placed in command of a military district in South Carolina with orders to break up the Ku-Klux Klan (q.v.). From 1871 to 1873 he succeeded in this so well that he received the thanks of the War Department. When similar conditions arose in the Red River district of Louisiana he was made commander there in 1875, remaining until the following year. As a consequence of his activities his nomination as lieutenant colonel in the regular army was held up for several years in the Senate by Southern sympathizers, but it was finally confirmed as from 1886. Merrill was retired in 1891.

MERRILL, SELAH (1837-1909). An American Congregationalist clergyman and United States Consul, born at Canton Centre, Conn. After studying at Yale and at the New Haven Theological Seminary, he was ordained in 1864. During the last year of the Civil War he was chaplain of the Forty-ninth United States colored infantry and in 1868 went to Germany, where he studied two years. In 1874-77 he was in Palestine as archaeologist of the American Palestine Exploration Society and was United States Consul at Jerusalem in 1882-85, 1891-93, and 1898-1907. While there he made important explorations and excavations to discover the second wall of Jerusalem and determine the site of Calvary. He taught at Andover Theological Seminary in 1872 and 1879 and became curator of the Biblical Museum there. In 1907 he became American Consul at Georgetown, Guiana. His works include: *East of the Jordan* (1881; 2d ed., 1883); *Galilee in the Time of Christ* (1881); *Greek Inscriptions Collected in the*

Years 1875-77 in the Country East of the Jordan (1885); *The Site of Calvary* (1885); *Ancient Jerusalem* (1906).

MERRILL, STEPHEN MASON (1825-1905). An American Methodist Episcopal bishop, born in Jefferson Co., Ohio. He entered the ministry of his church, joining the Ohio conference in 1846, was editor of the *Western Christian Advocate* (1868-72), and in 1872 was elected Bishop. He retired in 1904. He was a member of the General Conference of 1868 and 1872 and of the Ecumenical Methodist Conference of 1891. His chief works are: *Christian Baptism* (1876); *New Testament Idea of Hell* (1878); *Second Coming of Christ* (1879); *Aspects of Christian Experience* (1882); *A Digest of Methodist Law* (1885; rev. ed., 1913); *Organic Union of American Methodism* (1892); *Mary of Nazareth and her Family* (1895); *The Crisis of this World* (1896); *Atonement* (1901); *Sanctification* (1901); *Miracles* (1902).

MERRILL, STUART (1863-1915). An American poet of French residence, born at Hempstead, Long Island. He went to Paris as a child and studied at the Lycée Condorcet, studied law at Columbia University from 1885 to 1889, and in 1890 returned definitely to France. He wrote a number of articles for the *New York Times* and the *Evening Post* on contemporaneous French writers. His verse shows a fastidious delicacy of phraseology but possesses an almost magic power. He wrote: *Les gammes* (1887); *Pastels in Prose* (1890), translations from Banville, Baudelaire, etc.; *Les fastes* (1891); *Petits poèmes, d'automne* (1895); *Poèmes, 1887-1897* (1897); *Les quatre saisons* (1900). After 1900 his work appeared in literary reviews.

MERRILL, WILLIAM EMERY (1837-91). An American soldier and military engineer. He was born at Fort Howard, Wis.; graduated first in his class at West Point in 1859, and from September, 1860, to July, 1861, was assistant professor of engineering there. In the Civil War he served as assistant engineer in the Army of the Potomac during the Peninsular campaign and in the northern Virginia campaign, and from July, 1864, to September, 1865, commanded, as colonel, a regiment of veteran volunteer engineers. During the war he received the successive brevets of captain, major, lieutenant colonel, and colonel for gallant services. In March, 1867, he was raised to the regular rank of major and in February, 1883, to that of lieutenant colonel. From 1867 to 1870 he was chief engineer on the staff of General Sherman, then commanding the Military Division of the Missouri, and thereafter until his death he was engaged on engineering work for the government. One of the most notable engineering works of its kind in America was the Chauvine wicket movable dam constructed by him at Davis's Island, $5\frac{1}{2}$ miles below Pittsburgh. In 1889 he represented the United States Engineer Corps at the International Congress of Engineers at Paris. He published *Iron Truss Bridges for Railroads* (1870) and *Improvement of Non-Tidal Rivers* (1881).

MERRIMAC, THE. 1. A United States frigate, sunk with other vessels when the Federal government abandoned the Norfolk Navy Yard in 1861, and reconstructed as a Confederate ironclad. She was then renamed the *Virginia*. After destroying the *Congress* and the *Cumberland* at Newport News on March 8, 1862, she met the *Monitor* in Hampton Roads on March

9 and after a contest of four hours was obliged to withdraw. She was destroyed when the Norfolk yard was evacuated by the Confederates on May 11, 1862. See HAMPTON ROADS; MONITOR.

2. A collier accompanying the United States fleet investing Santiago de Cuba in 1898. In an effort to prevent the escape of the Spanish fleet she was sunk at the mouth of the harbor on June 3 by Lieut. Richmond P. Hobson, who, after accomplishing his perilous feat, was captured by the Spaniards and held prisoner until July 6.

MERRIMAC RIVER. A river of New Hampshire and Massachusetts. It is formed near Franklin by the union of the Winnepesaukee and Pemigewasset, the former being the short outlet of the lake of that name and the latter the outlet of Profile Lake, in Franconia, N. H., 50 miles north of Franklin and less than 10 miles from Mount Washington (Map: Massachusetts, E 2). From Franklin the river flows southward for about 60 miles, until it enters Massachusetts, when it turns eastward for about 40 miles and empties into the Atlantic Ocean at Newburyport. Its drainage area is about 5015 square miles, and its chief importance is the water power which it furnishes to the manufacturing cities of Lowell, Lawrence, and Manchester.

MERRIMAN, HENRY SETON. The pseudonym of the English novelist Hugh S. Scott (q.v.).

MERRIMAN, JOHN XAVIER (1841-). A South African statesman. He was born at Street, Somersetshire, the son of N. J. Merriman (1810-82), who was Bishop of Grahamstown. He first went to South Africa in 1849 and again, after studying in England, in 1861; and in 1869 entered politics in Cape Colony. He was Commissioner of Crownlands in 1875-78 (Molteno ministry) and 1881-84 (Scanlen ministry) and Treasurer General in 1890-93 (Rhodes ministry) and in 1898-1900 (Schreiner ministry). In 1896 he was a member of the committee on the Jameson Raid and drew up its report. He opposed Kruger's narrow policy in 1898. With J. W. Sauer in the summer of 1901 he represented the Cape Afrikaners in a mission to London which sought to continue the independent republics. In 1908, upon the victory of the Bond party, he succeeded Jameson as Premier of Cape Colony and for two difficult years held this post and that of Treasurer. He was a prominent member of the National Convention for Union in 1908-09; and in 1910 opposed the formation of a coalition cabinet for the Union and refused to serve in a cabinet under Botha.

MERRIMAN, MANSFIELD (1848-). An American civil engineer, born at Southington, Conn. He graduated at Sheffield Scientific School (Yale) in 1871, was assistant in the United States Corps of Engineers in 1872-73, and instructor in civil engineering at Sheffield from 1875 to 1878. He was professor of civil engineering in Lehigh University from 1878 to 1907 and thereafter a consulting civil and hydraulic engineer. From 1880 to 1885 he was also assistant on the United States Coast and Geodetic Survey. His researches in connection with hydraulics, bridges, strength of materials, and pure mathematics are important. His chief publications, widely used as standard textbooks, are: *Method of Least Squares* (1884; 8th ed., 1901); *Mechanics of Materials* (1885; 10th ed., 1910); with Jacoby, *A Text-Book on Roofs and*

Bridges (4 vols., 1888-98; 5th ed., 1912); *Treatise on Hydraulics* (1889; 9th ed., 1914); *Handbook for Surveyors* (1895; 3d ed., 1903); *Strength of Materials* (1897; 6th ed., 1913); *Precise Surveying and Geodesy* (1899); *Elements of Sanitary Engineering* (1898; 3d ed., 1906); *Elements of Hydraulics* (1912). In addition, he was editor in chief of the *American Civil Engineers' Pocket Book* (1911).

MERRITT, ERNEST GEORGE (1865-). An American physicist. He was born at Indianapolis, Ind.; attended Purdue University in 1881-82; graduated M.E. from Cornell in 1886; and studied at Berlin in 1893-94. At Cornell he was instructor in physics in 1888-91, assistant professor from 1892 to 1903, professor after 1903, and dean of the Graduate School after 1909. He served as vice president of the American Physical Society and contributed to periodicals various papers on physics.

MERRITT, WESLEY (1836-1910). An American soldier, prominent in the Civil War and the Spanish-American War. He was born in New York City. After graduating at West Point in 1860 he was assigned to a cavalry regiment (1861), acted as aid to General Cooke (1862), participated in Stoneman's famous raid towards Richmond (April-May, 1863), and commanded the reserve cavalry brigade of the Army of the Potomac in the battle of Gettysburg and in the Richmond campaign of April-August, 1864. In the Shenandoah Valley campaign under Sheridan and in the final Richmond campaign he commanded cavalry divisions. By the end of the war he was major general of volunteers and brevet major general in the regular army. Afterward he saw varied service, first in the Southwest, on frontier duty at various stations. In 1876, the year that he was promoted colonel of the Fifth Cavalry, he served in the Big Horn and Yellowstone Indian campaigns in Wyoming and Dakota. From 1882 to 1887 he was superintendent of the United States Military Academy. Merritt was promoted brigadier general (1887) and major general (1895). He was in command of the Department of the East in 1897-98; was placed in command of the United States forces in the Philippine Islands in May, 1898; and later in the same year was summoned to Paris to assist the American peace commissioners. Thereafter until his retirement in June, 1900, he commanded the Department of the East.

MERRITT, WILLIAM HAMILTON (1793-1862). A Canadian statesman. He was born in Westchester Co., N. Y., and in 1796 was taken to Upper Canada by his parents, who were United Empire Loyalists. (See LOYALISTS.) He was educated at Ancaster, Upper Canada, and at King's College, Windsor, Nova Scotia. During the War of 1812-15 he took part in the capture of Detroit and the battles of Queenston Heights, Stoney Creek, and Lundy's Lane. He projected the Welland Canal (q.v.) and the Welland Railway, and it was mainly through his efforts that both were constructed. In 1845 he also projected the Niagara Falls suspension bridge. Merritt was a Liberal member of the Upper Canada Legislative Assembly in 1832-41. He was President of the Council in the Lafontaine-Baldwin administration (1848) and in 1850 Commissioner of Public Works, and in 1860 he was elected a member of the Canada Legislative Council. His writings include: *A Concise View of the Inland Navigation of the Canadian Prov-*

inces (1832); *A Brief Review of the Revenue, Resources, and Expenditure of Canada* (1845); *A Journal of Events Principally on the Detroit and Niagara Frontier during the War of 1812* (1863).

MERRITT, WILLIAM HAMILTON (1855-). A Canadian mining engineer and soldier, grandson of the preceding. He was born at St. Catharines, Ontario, and was educated at Upper Canada College, the Royal Military School, and the Royal School of Mines, London, England, where he graduated in 1877. He practiced his profession in Toronto. In 1878 he served in connection with the Canadian commission at the Paris Exposition, and was later appointed lecturer in mining engineering in the School of Mining, Kingston. He was a member of the Royal Commission to inquire into the mineral resources of Ontario and was elected vice president of the Ontario Mining Institute. Merritt was gazetted a cornet in the Governor-General's bodyguard in 1884, served in the Northwest rebellion (1885), in the Boer War (1899-1902), taking part in many actions, and was promoted lieutenant colonel in 1903. He contributed papers to the *Proceedings* of the Geological Society, London, England; *Proceedings* of the American Institute of Mining Engineers; and *Proceedings* of the Canadian Institute. He published *Economic Minerals of Ontario* (1896) and *Field Testing for Gold and Silver* (1900).

MERRY, ROBERT (1755-98). An English poet, born in London. He studied at Christ College, Cambridge, and began the study of law, but was never called to the bar. Merry traveled extensively throughout Europe, and in Florence was made a member of the so-called Della Crusca Circle. He wrote much for the Florence *Miscellany*, and after his return to England published reams of affected and grandiloquent verse over the signature Della Crusca. He also wrote a number of incoherent dramas, including: *Lorenzo* (1791); *The Magician No Conjuror* (1792); *The Abbey of St. Augustine* (1797). From 1796 he resided in the United States, where his wife, Elizabeth Brunton, was an acceptable actress for many years.

MERRY, WILLIAM WALTER (1835-). An English classical scholar, clergyman, and educator. He was born in Worcestershire and was educated at Cheltenham College and Balliol College, Oxford, where he gained the chancellor's prize for a Latin essay in 1858. He was select preacher to the university in 1878-79 and in 1889-90, and Whitehall preacher in 1883-84; public orator at Oxford from 1880 to 1910; a member of the Hebdomadal Council (1896-1908); and vice chancellor (1904-05). For many years he was engaged in the preparation of editions of the classical authors, published by the Clarendon Press, Oxford. Of these may be mentioned Homer's *Odyssey* (books i to xii, with James Riddell; 2d ed., 1886); a school edition of the same books and another of books xiii to xxiv—of the former 66,000 copies were sold, of the latter 16,000; a series of editions of the plays of Aristophanes, begun in 1879. (Some of these have gone through several editions.) Other works in classical literature are *The Greek Dialects* (1875) and *Selected Fragments of Roman Poetry* (2d ed., 1901).

MERRY DEL VAL, RAPHAEL, CARDINAL (1865-). A Roman Catholic prelate, born in London (where his father was secretary of

the Spanish legation) and educated partly in England, partly in Rome. In 1888 he took orders, in 1892 was made papal chamberlain, and in 1897 became prelate of the papal household. He represented the Vatican at the jubilee of Queen Victoria and the coronation of Edward VII, and was sent on a special mission to Canada; in 1900 was consecrated Bishop of Nicæa in partibus; was secretary of the conclave which in August, 1903, elected Pius X pope; and in October succeeded Cardinal Rampolla as papal Secretary of State. In the conduct of this important office he was criticized for adopting an aggressive policy which helped to intensify the strained relations between the Curia and the French government. In November, 1903, he was created Cardinal. In September, 1914, upon the accession of Pope Benedict XV, Merry del Val was succeeded as Secretary of State by Cardinal Ferrata (q.v.). Although probably the most widely known representative of the Catholic hierarchy, it was not expected that he could be elected Pope, because of the antagonism he had aroused. While Pius was Pope Merry del Val had sought persistently to acquire more power for himself. In October, 1914, he was appointed secretary of the congregation of the Holy Office. He wrote *The Truth of the Papal Claims* (1909).—His brother, DON ALFONSO MERRY DEL VAL (born, 1864), after being long in the Spanish diplomatic service, was appointed Ambassador to Great Britain in 1913.

MERRY DEVIL OF EDMONTON, THE. An anonymous comedy acted in 1607 and printed in 1608. It has been attributed on slight evidence to Drayton by Coxeter, and also ascribed to Shakespeare. Fleay thinks the play, originally called *Sir John Oldcastle*, was written by Drayton for the Chamberlain's Men before 1597, and that the prose story of the same title by T. B., 1608, is not to be identified with the play. It was very popular; Jonson remarks that it was the "dear delight of the public." Allusions to it are found in *Grim, the Collier of Croyden*, and probably in *Merry Wives of Windsor* as well.

MERRY ENGLAND. An old popular name of England, in which the word merry has its early meaning of pleasant.

MERRY MONARCH, THE. A nickname of King Charles II of England.

MERRY MOUNT. The name of a settlement made by Thomas Morton within the limits of the present Quincy, Mass. See MORTON, THOMAS.

MERRY WIVES OF WINDSOR, THE. A comedy by Shakespeare, produced probably in 1597, printed complete in 1623. An imperfect copy, entitled *Sir John Falstaff and the Merry Wives of Windsor*, was printed by Thomas Creede in 1602, bearing evident marks of haste. The play was made for a court performance and is said to have been written at Queen Elizabeth's command, to show Falstaff in love. Some incidents of the plot are taken from two tales in Straparola's *Notti Piacevoli*; from Tarleton's *The Lovers of Pisa* in his *Neues Out of Purgatorie*; from Brainford's "Fishwife's Tale" in *Westward for Smelts*. The buck basket found in the tale of Buciolo in Fiorentino's *Pecorone* is in the comedy the basket of soiled linen in which Falstaff hides. It is notably a play of middle-class people and, like *Much Ado about Nothing*, is mostly prose. A version called *The*

Comical Gallant was made in 1702 by John Dennis, who is one authority for Elizabeth's connection with the play. Another is Rowe in 1709.

MERSCHIED, mër'shit. A town of Germany. See OHLIGS.

MERSEBURG, mër'ze-burk. A town in the Province of Saxony, Prussia, situated on the Saale, about 20 miles west-northwest of Leipzig (Map: Germany, D 3). It consists of the city proper, the free ground of the cathedral, the new quarters, and the suburbs of Altenburg and Neumarkt. Its fine cathedral, begun in the eleventh and finished in the sixteenth century, contains the grave of Rudolf of Swabia, a fine chancel and organ. The Gothic castle, the former residence of the bishops, is now used as an administration building. There are also the Rathaus, the assembly house, and the chapter house. The Gymnasium, founded in 1575, is the chief educational institution. Merseburg manufactures machinery, leather, iron products, toys, textiles, motors, cellulose, cigars, dyes, and beer. It is considered one of the oldest towns of Germany. As early as the ninth century it was the residence of the counts of Merseburg. During the tenth, eleventh, and twelfth centuries it was the favorite residence of the German emperors and the seat of a bishop and many diets. Merseburg was the seat of an important bishopric in the Middle Ages. With the introduction of Protestantism the see passed to Saxony. Its fairs were also of great importance. Near Merseburg the German King, Henry the Fowler, won a great victory over the Hungarians in 933. Pop., 1900, 19,119; 1910, 21,226, chiefly Protestants.

MERSENNE, mâr'sën', MARIN (1588-1648). A French theologian and scholar, born at La Soultière (Maine). He studied at the college of La Flèche, where he had as a fellow pupil René Descartes, with whom he always maintained a close friendship. In 1611 he became a Minim friar. Afterward he taught philosophy at Nevers from 1614 to 1620, and subsequently lived principally in Paris. He was the Parisian representative of Descartes while the latter was in Holland. Later his studies grew more scientific and he published a number of treatises on astronomy and mathematics. He also wrote *Harmonie universelle, contenant la théorie et la pratique de la musique* (1636), and a Latin epitome of it, *Harmonicorum Libri XII* (1636). From these we learn much of the condition of music in the seventeenth century and his own discoveries in the phenomena of vibration.

MERSEY, mër'zi. A river of England, separating the counties of Chester and Lancaster (Map: England, D 3). It enters the Irish Sea by a wide estuary forming the Liverpool channel. This channel is deep and navigable for several miles above Liverpool. By means of a ship canal, which follows for some distance the course of the river and crosses it several times, navigation can be continued to Manchester and beyond. See LIVERPOOL.

MERSHON, mër'shon, RALPH DAVENPORT (1868-). An American electrical engineer and inventor, born at Zanesville, Ohio. He graduated M.E. from Ohio State University in 1890; was employed by the Westinghouse Electric and Manufacturing Company from 1891 to 1900; and thereafter was in practice as a consulting engineer. He installed the electric plant of the Colorado Electric Power Company at Cripple

Creek; reconstructed the transmitting and receiving apparatus of the Montreal and St. Lawrence Light and Power Company, and designed the plants of the Shawinigan Water and Power Company of Montreal and the Niagara, Lockport, and Ontario Power Company. In 1905 he was consulting engineer of the Victoria Falls Power Company (South Africa). He invented a six-phase rotary converter, a compounded rotary converter, and a system of lightning protection for electric apparatus for which he received the John Scott Legacy medal of the Franklin Institute. In 1912-13 he was president of the American Institute of Electrical Engineers.

MERSINA, mēr'sē-nā'. A seaport town in the Vilayet of Adana, Asia Minor, situated on the south coast, 41½ miles by rail west-southwest of Adana (Map: Turkey in Asia, C 3). It is well built and surrounded by fine gardens. The harbor, an open roadstead, is not very deep, and steamers usually anchor a long distance from the town. It is the busiest port on the south coast of Asia Minor, being the outlet for a rich agricultural district. The United States is represented by a consular agent and it is the seat of an American mission. Mersina is of recent origin; its population is estimated at over 15,000, about one-half Christian, of whom the Armenians and the Greeks are in the majority.

MERSON, mār'sōn', LUC OLIVIER (1846-1920). A French decorative and historical painter, born in Paris. He studied under Chassevent and Pils, was awarded the Prix de Rome in 1869, and obtained a gold medal at the Paris Exposition of 1889. His pictures, treating historical and religious subjects, are painted with peculiar, poetic charm, and his drawings have the same delicate, almost tender, quality. His most notable mural paintings are two episodes from the life of St. Louis, in the Palais de Justice, Paris, and decorations by him are in the Opéra Comique, the Hôtel de Ville, the Sorbonne, and the church of St. Thomas d'Aquin. Among his other paintings are "St. Isidore" and "The Annunciation" (1903). He illustrated Victor Hugo's *Notre Dame de Paris* and works by Gautier, Flaubert, and others.

MERTHYR TYDFIL, mēr'thēr tid'vil. A municipal, parliamentary, and county borough in Glamorganshire, south Wales, surrounded by lofty hills and built on the river Taff, about 500 feet above sea level, 22 miles northwest of Cardiff (Map: England, C 5). Merthyr Tydfil is the seat of the iron trade of south Wales, and contains large collieries, celebrated for the excellence of steam coal. The Dowlais Ironworks have 18 blast furnaces, and Cyfartha works produce steel. The town has greatly improved since 1850; it has modern churches, a town hall, public baths, a library, a good water supply, and two profitable sewage farms. It maintains two infectious-disease hospitals. Pop., 1901, 69,228; 1911, 80,990.

MERTON, mēr'ton, WALTER DE (?-1277). An English prelate, founder of Merton College, Oxford. He was educated in the priory at Merton, Surrey, and was ordained to the priesthood. Henry III raised him in 1261 to the lord-chancellorship, from which office he was deposed in 1263 by the barons under Simon de Montfort. He returned to that office in 1272, but in 1274 resigned to accept an appointment to the see of Rochester. He founded at Basingstoke a hos-

pital for superannuated clergymen and travelers in distress, but is best known as the founder of Merton College (q.v.), Oxford, which was completed in 1274. This was originally designed, it would appear, for the education of the secular clergy and offered courses in philosophy, the liberal arts, and theology—in *arte, dialectica, et theologia*, as the Rochester chronicles express it. It became the model of subsequent foundations at both Oxford and Cambridge, and was thus the basis of the collegiate system peculiar to these two English universities.

MERTON COLLEGE. The oldest college of its type in Oxford and the model of all later secular colleges in both Oxford and Cambridge. It was first founded as the House of the Scholars of Merton, in 1263 or 1264, by Walter de Merton (q.v.). The original endowment consisted of his manor house and estate at Malden, Surrey, the income from which was to go to the support of scholars in Oxford, the estate being managed by a resident warden and "brethren." By various changes between 1264 and 1274 the scholars were moved from a rented house to their own property, Merton Hall, acquired for them by the founder, and were put in charge first of a subwarden, then of the warden himself, who had come up from Surrey. The number of scholars, who had been originally confined to the members of the founder's family, was increased, and the collegiate idea of the foundation was crystallized in the Statutes of 1274. The addition of a system of ecclesiastical patronage, the arrangement of the buildings, and the plan, size, and beauty of the chapel, in addition to the scheme of the statutes, had great influence on later foundations. The college has suffered various changes since its establishment, the last of which was its absorption of St. Alban Hall in 1882. There were, in 1911-12, a warden, 19 fellows, 2 honorary fellows, 34 scholars and exhibitors, 4 lecturers, 2 chaplains, college officers, and, in all, some 150 undergraduates. The buildings are among the most interesting in Oxford, being partly of the thirteenth century. Here Henrietta Maria occupied the warden's apartments, while Charles I's court was held at Oxford. Again, in 1665, the year of the plague, Charles II moved his court hither, and his Queen occupied the lodgings formerly used by Henrietta Maria. The chapel, though not completed, is of cathedral size, but has no transepts. Among the worthies of Merton may be mentioned Harvey, the demonstrator of the circulation of the blood, Bishops Patterson and Jewell, Anthony Wood, Sir Thomas Bodley, Sir Richard Steele, and Sir H. Savile. Consult Hastings Rashdall, *Universities of Europe in the Middle Ages*, vol. ii, part ii (Oxford, 1895), and Henderson, "Merton College," in *University of Oxford College Histories* (London, 1902). See MERTON, WALTER DE; OXFORD UNIVERSITY.

MERU, mā'rōō. A fabulous mountain in Hindu mythology, the abode of the gods. It is supposed to stand at the centre of the world, and it towers to a height of 80,000 leagues; the sun, moon, and stars revolve about its summit. Regarded as a terrestrial mountain, it would seem to have been located somewhere to the north of the Himalayas.

MERULO, mēr'ōō-lō, CLAUDIO (1533-1604). An Italian organist and composer, born at Correggio. His real name was Merlotti. A pupil of Girolamo Donati, he began his career as organist at Brescia. In 1557 he came to Venice as second

organist at San Marco. He succeeded to the position of first organist in 1566, and this important post he held for 20 years, when the Duke of Parma offered him the post of court organist. He died at Parma. Not only was he one of the greatest masters of his instrument, but his compositions for organ are of permanent value, being among the earliest specimens of a distinct organ style, which a little later became a most important factor in the development of instrumental music. His vocal compositions consist of several books of madrigals, motets, and masses; his works for organ comprise three books of *Ricercari*, three of *Canzoni*, and two of *Toccate*. Consult G. Gasperini, *Claudio Merulo da Correggio* (Parma, 1904).

MERV, mĕrf. A region in Central Asia now forming a district in the Russian Transcaspian Province, a short distance from the northeast corner of Persia (Map: Asia, Central, J 4). Its area is estimated at about 49,000 square miles. The northern and larger part is a vast sandy plain with very little vegetation. The southern part is more elevated and watered by the Murghab and its tributaries. The summers are long and hot, and the annual average temperature is from about 57° F. to 60° F., ranging from -6° F. to 113° F. The precipitation is very meagre, especially in the northern part. The chief occupation of the inhabitants is agriculture, which is made possible only by irrigation. Unirrigated regions are utilized to some extent for stock raising by the nomadic tribes. The chief centre of agriculture is the oasis of Merv, to which the name was formerly confined. The area of the oasis is about 2000 square miles, and it contains a large share of the population of the district, though there is a considerable nomadic population outside the oasis. The water for irrigation is supplied by the Murghab and a few of its tributaries. Wheat, rye, millet, and barley are the chief cereals raised in the irrigated portions of the territory. The oasis is renowned throughout the East for its fertility. The carpets are regarded as superior to the Persian, and the manufactures of silver hold high rank. Transportation is effected principally by the use of pack animals, although the territory is crossed by the Transcaspian Railway line. Near the railway line are the Imperial estates of Murghab, with extensive irrigation works. The population of the district is variously estimated from 120,000 to 240,000; that of the oasis is about 120,000 and is composed, with the exception of a few Russian Jews and Persians, of Tekke Turkomans, divided into a number of clans. They all profess Islam.

The capital of the district, known as New Merv, is situated on the Murghab and the Transcaspian Railway. It has a number of schools, churches, a meteorological observatory, and some trade. The population is about 12,000, consisting of Russians, Turkomans, Armenians, Persians, and Jews. About 25 miles east of New Merv are the ruins of three cities, of which one, existing in the time of Strabo, was, according to that historian, of great extent and importance.

Merv is a very ancient settlement, its name (Mouru) being mentioned in the Zend-Avesta. In old traditions it is looked upon as the cradle of the human race. It once formed a satrapy of the Persian Empire. An archbishopric of the Nestorian church existed there as early as the fifth century. Occupied by the Arabs in the

seventh century, the city of Merv became the capital of Khorasan and a great intellectual centre, rising to still greater importance in the eleventh century while under the rule of the Seljuks. The prosperity of Merv came to an end with the invasion of the Turkomans about the middle of the eleventh century. The district was almost entirely depopulated by the Monguls under Tulai in 1221. At the end of the fourteenth century it fell into the hands of Timur, and after a short occupation by the Uzbeks at the beginning of the sixteenth century was taken by the Persians, under whose rule it remained until 1787, when it was occupied and later entirely devastated by the Bokharians. About the middle of the nineteenth century it was invaded by the Tekke Turkomans, who became the ruling race (1556). In 1884 Merv was annexed by Russia. In 1898 a strategical railroad from Merv to the frontier of Afghanistan was opened up.

MERWARA. See AJMERE-MERWARA.

MERX, mĕrks, ADALBERT (1838-1909). A German theologian and Orientalist. He was born at Bleicherode, near Nordhausen, and studied at Jena, Marburg, Halle, and Berlin. From 1865 to 1875 he was professor of Semitic philology and theology at Jena, Tübingen, and Giessen. In the latter year he took the chair of theology at Heidelberg. He belongs to the school of liberal theologians, who fully acknowledge the right of unrestricted criticism of the Scriptures. Among his published works are: *Das Gedicht von Hiob* (1871); *Die saadjanische Uebersetzung des Hohenliedes ins Arabische* (1883); "Historia Artis Grammaticæ apud Syros," in *Abhandlungen für Kunde des Morgenlandes* (Leipzig, 1889); *Idee und Grundlinien einer allgemeinen Geschichte der Mystik* (1893); *Die vier kanonischen Evangelien nach ihrem ältesten bekannten Texte* (1897-1905).

MÉRY, mǎ'rĕ', JOSEPH (1798-1866). A French satirical poet, born Jan. 21, 1798, in Aigalades (Bouches-du-Rhône). In 1824 he went to Paris, where he aroused attention through a political satire, *La Villélaide, les Jésuites* (1826), by some Bonapartist poems, and by work on a satirical journal *Némésis*. Later he wrote dramas, romances, and novels remarkable for their exotic descriptions of lands Méry had never seen. Of his once very popular stories, *Héra* (1843) and *Nouvelles nouvelles* (1853) are sufficiently typical. Méry died in Paris, June 17, 1866. Consult Claudin, *Méry, sa vie intime* (Paris, 1866).

MERYON, mǎr'yōn', CHARLES (1821-68). A French etcher, born in Paris. He was educated at the Naval School in Brest and afterward rose to the position of lieutenant in the navy. Failing health caused him to resign, and he took up etching, which he studied at Paris, achieving the highest success in this art. Though strong and precise, his execution is of rare delicacy and his art is highly imaginative. His fame is posthumous; he lived in poverty and discouragement and died in an insane asylum at Charonton. Of his etchings the best known are the series of 23 plates, *Eaux-fortes sur Paris* (1850-54), which fairly evoke the spirit of old Paris, then rapidly disappearing under the improvements of Haussmann. Consult: Wedmore, *Meryon and Meryon's Paris* (London, 1879); Burty, *L'Œuvre de Charles Meryon*, translated by Huish (ib., 1879); Bouvenne, *Notes et Souvenirs sur Charles Meryon* (Paris, 1883); Loys

Delteil, *Peintre-Graveur illustré*, vol. ii (ib., 1907).

MERZ, JOHN THEODORE (1840-1922). An English writer on philosophy, born in Manchester and educated in Germany—at Darmstadt, Giessen, Göttingen, Heidelberg, and Bonn. He lived in Newcastle-upon-Tyne, where he was director in chemical and electrical corporations and a member of the Armstrong College of Durham University. Merz received honorary degrees from Durham and Aberdeen for his book on Leibnitz (1884), in the "Philosophical Classics," and for his remarkable work entitled *A History of European Thought in the Nineteenth Century* (4 vols., 1896-1914; vol. i, 3d ed., 1907; vol. ii, 2d ed., 1912).

MERZIVAN. See MARSIWAN.

MESA, mā'sá. A Spanish word meaning "table" (cf. Latin *mensa*) and used especially in the southwestern United States to designate the small, isolated remnants of plateaus, usually rising abruptly from the surrounding plains, which are found scattered over the region traversed by the Colorado River (Map: Colorado, A 2). The mesas result from the dissection of a plateau, having horizontal strata, but with the upper layer of more resistant rock than the underlying. In many cases the capping stratum represents portions of an ancient lava flow which has been poured over the sedimentary rocks. In the process of denudation the underlying weaker strata crumble under the weathering process, the overlying resistant stratum is thus gradually undermined, and fragments of the latter fall down. Thus the face of the mesa is generally steep, called an escarpment face, and this is maintained during all the time of the process of denudation. The name "mesa" is generally applied to remnants of plateaus of considerable top area, and smaller areas of similar form are called buttes. The Enchanted Mesa and the Mesa Verde are frequently used as types.

The Enchanted Mesa, called by the Indians Katzimo, is situated near the village of Acoma in west central New Mexico. It is a perpendicular sandstone rock rising from a grassy plain. It is of elongated shape, 2050 feet long, and from 100 to 350 feet wide. Above a sloping talus, 100 to 200 feet in height, towers the perpendicular wall to a height of 430 feet above the plain. The summit is nearly level and consists of a hard rock very much weathered and supporting a few stunted cedars. The rock is held in superstitious awe by the neighboring Acoma Indians, and a tradition is current among them that their remote ancestors once inhabited the summit. This mesa has been described by F. W. Hodge in "The Enchanted Mesa," in *National Geographical Magazine*, vol. viii (1897), pp. 273-284, and here he writes of the evidences of a former occupation.

The Mesa Verde is situated in the extreme southwestern corner of Colorado, on the right bank of the Mancos River. It is a plateau 15 miles long and 8 miles wide. Its talus is 300 to 500 feet high, above which rises a precipitous wall of yellow sandstone 150 to 300 feet farther, the top of the mesa being 400 to 800 feet above the plain. The area has enough rainfall to support a covering of grass and a scattering of scrubby cedars and piñons, and from this the mesa derives its name (*Verde* = green). The summit is more accessible than that of the Enchanted Mesa, being intersected by the numerous ramifications of a cañon which opens into

that of the Mancos River. The rock walls of the Mesa Verde are interrupted by numerous horizontal ledges occupied by the ruins of ancient cliff dwellings, some in a remarkable state of preservation. Large numbers of stone implements, potsherds, and some mummies have been found among the ruins. Consult Atwood, "A Geographic Study of Mesa Verde," in *Annals of the Association of American Geographers*, vol. i (1911), p. 95. See CLIFF DWELLER.

MESA. A town in Maricopa Co., Ariz., 18 miles by rail southeast of Phoenix, on the Arizona Eastern Railroad (Map: Arizona, D 4). Among the interesting features of the town are the public library, the Toltec ruins, government experimental farm, Granite Reef Dam, government power plant, and the splendid public-school buildings. Mesa is in a rich agricultural, fruit-growing, and stock-raising region. It has ample water power, derived mainly from the Roosevelt Dam (q.v.). The town was settled in 1879 by a colony of Mormons from Salt Lake City and other places in Utah, but is now composed mostly of non-Mormons. The water works are owned by the municipality. Pop., 1900, 722; 1910, 1692.

MESAGNE, mā-sā'nyā. A town in the Province of Lecce, south Italy, about 10 miles by rail southwest of Brindisi. It is an ancient town, picturesquely situated in a fertile region, producing oil, wine, grain, and fruit. Pop. (commune), 1901, 12,105; 1911, 13,740.

MESARCH, mēs'ark. A term used in the vascular anatomy of plants. In the development of a xylem (wood) strand the first elements to appear are spiral vessels, and this first group of elements is called the protoxylem. If the later xylem elements (metaxylem) develop in every direction from the protoxylem, so that it becomes surrounded by metaxylem, the xylem strand is said to be mesarch. The coördinate terms are exarch and endarch, the former indicating that the metaxylem is developed centripetally from the protoxylem, and the latter that it is developed centrifugally. The result is that in an exarch strand the protoxylem is upon its outer edge; in an endarch strand the protoxylem is upon its inner edge (next to the pith); while in a mesarch strand the protoxylem is embedded in metaxylem. Exarch strands are the most primitive, occurring in all roots and in the stems of the more primitive pteridophytes (as club mosses); mesarch strands are characteristic of the ferns; while seed plants have endarch strands.

MESA VERDE. See MESA.

MESCAL. See AGAVE.

MESCALA, mäs-kä'lā, or **MEXCALA**. A river of Mexico, rising in the State of Tlaxcala, 60 miles east of Mexico City. It flows in a general westerly direction for 430 miles and empties into the Pacific near Zacatula. It is known in its upper course as the Atoyac, and in the lower, where it serves as the boundary line between the states of Guerrero and Michoacán, as the Río de la Balsas. The current is exceedingly swift, and the river is navigable for only a short distance, but it furnishes power to a number of textile and other mills.

MESCALERO, mäs-kä-lā'rō. A small Athapaskan tribe. They receive their name from their use of mescal bread prepared from the maguery root by roasting under cover until it softens into a white, sticky, and sweetish mass, which is said to be extremely nutritious. They

formerly ranged over the arid Pecos and Staked Plain region of Texas and New Mexico, and were constantly at war with the Ute and Navaho, while maintaining a precarious friendship with the Kiowa and Comanche. They lived entirely by hunting and depredation upon the frontier settlements of Texas and Mexico, in company with other roving tribes, and were distinguished for their warlike and cruel disposition. Their shelters were mere wickiups of boughs; they planted nothing and went nearly naked. Since about 1865 they have been confined upon a reservation in southeastern New Mexico. In 1855 they were estimated at about 750. They number now 424. Consult P. E. Goddard, *Indians of the Southwest* (New York, 1913).

MESDAG, mēs'däg, HENDRIK WILLEM (1831-1915). An eminent Dutch marine painter. He was born in Groningen, the son of a banker, and until the age of 35 he followed his father's vocation. Encouraged by his wife, he then studied painting under Roelofs and Alma-Tadema in Brussels, and afterward lived at The Hague. He is one of the best of Dutch marine painters. His style is realistic and simple, and his work is characterized by breadth of treatment, fine atmospheric effects, sober color, and harmony of feeling. He is preëminently the painter of the North Sea. His services to modern Dutch painting are incalculable. Possessed of considerable wealth, he was a liberal patron of his less fortunate fellows and devoted his time and money to the organization of exhibitions and every other means of promoting Dutch art. His works include: "Return of the Fishing Boats" (1875), in The Hague Museum; "The Shore at Scheveningen," "A Calm Sea," and six other paintings, including two portraits, in the Rijks-Museum; "Summer Evening near Scheveningen," in the Berlin Gallery; "After the Storm," in the Brussels Gallery. He also painted an interesting panorama of Scheveningen, which, together with a collection of his own and his wife's work, forms a permanent exhibition at The Hague. In 1902 he presented to The Hague his admirable collection of paintings, including excellent specimens of the Barbizon school and modern Dutch painting, bronzes, porcelains, and rugs, together with the house especially built for it. Among many other honors Mesdag received the cross of the Legion of Honor in 1889.—His wife, SIENTJE MESDAG-VAN HOUTEN (1834-1909), was also a painter of impressionistic tendencies. Consult: Zilcken, *Hendrik Willem Mesdag* (Eng. ed., London, 1896); *Dutch Painters of the Nineteenth Century*, vol. ii, edited by Rooses (ib., 1898-1901); Marius, *Dutch Painting of the Nineteenth Century* (Eng. trans., ib., 1908).

MES'EMBRYA'CEÆ (Neo-Lat., from Gk. μεσημβρία, *mesēmbria*, midday, from μέσος, *mesos*, middle + ἡμέρα, *hēmera*, day; so called because the flowers of many species open only during midday). A family of dicotyledonous herbs or shrubs, now generally called Aizoaceæ. They are mostly natives of warm regions and include about 24 genera and 500 species. The family belongs to the Centrospermales, an order which begins with Chenopodiaceæ (goosefoot family) and culminates in the Caryophyllaceæ (pink family), an order characterized by its conspicuous perisperm. *Mesembryanthemum* is much the largest genus of the family, comprising about 300 species, which form a very characteristic feature of

the flora of South Africa. Two genera are represented in the flora of North America, viz., *Sesuvium*, the sea purslane, two species of which occur on sandy beaches and alkaline plains; and *Mollugo*, the carpet weed, which occurs as a weed in waste places and cultivated grounds throughout North America. The leaves of some species, when burned, yield soda in great abundance. Large quantities of barilla are made from them in the Canary Islands, in Spain, and in Egypt. The seeds of some, as the ice plant (*Mesembryanthemum crystallinum*), and of *Mesembryanthemum geniculiflorum* are ground into flour to make bread. *Mesembryanthemum geniculiflorum* is used as a potherb in Africa. The fruit of *Mesembryanthemum edule* (known as Hottentot figs) is eaten in South Africa, and that of *Mesembryanthemum æquilaterale* (pig's-faces) in Australia. *Mesembryanthemum anatumicum* is called kou by the Hottentots, who beat and twist up the whole plant, allow it to ferment, and chew it like tobacco. When nearly fermented it is narcotic and intoxicating. Some species of *Mesembryanthemum* are common annuals in flower gardens.

MESEN, mā'zyēn. A river in Russia. See MEZEN.

MESENTERON. See ALIMENTARY SYSTEM.

MES'ENTERY AND ITS DISEASES. The mesentery derives its name from being connected to the middle portion (Gk. μέσος) of the small intestine (ἔντερον). It is a broad fold of peritoneum (the great serous membrane of the abdomen) surrounding the jejunum and ileum and attached posteriorly to the vertebral column. Its breadth between the intestinal and vertebral borders is about 4 inches, its attachment to the vertebral column is about 6 inches in length, and its intestinal border extends from the duodenum to the end of the small intestine. It serves to retain the small intestines in their place, while at the same time it allows the necessary amount of movement, and it contains between its layers the mesenteric vessels, the lacteal vessels, and mesenteric glands. These lymph glands are 100 to 150 in number and are about the size of an almond. They elaborate the contents of the lacteals, the chyle being more abundant in fibrin and corpuscles after it has passed through them. The most important affection of these organs is their tubercular degeneration, which gives rise to *tabes mesenterica*, a disease most common in childhood, but confined to no period of life. It may be associated with tubercular infection of other parts of the body, such as pulmonary consumption, tubercular peritonitis, or caries of the spine; but sometimes the mesenteric glands are exclusively affected. The leading symptoms are loss of color and flesh, diarrhœa, and occasional vomiting, pain in the region of the navel, increased by pressure, tumefaction and hardness of the abdomen, with general emaciation. The enlarged glands can sometimes be detected by careful palpation, especially in advanced cases and when the peritoneum is also involved. The progress of the disease is generally slow.

The treatment mainly consists in the administration of cod-liver oil, tonics, and laxatives. When the disease has advanced to a considerable extent, medicines are of little use, except to palliate some of the more urgent symptoms.

Independently of the disease that has just been noticed, inflammation of these glands is by no means uncommon when the mucous membrane

of the small intestine is ulcerated, as, e.g., in typhoid or enteric fever.

The mesentery may be the site of hemorrhages, as in aneurism or some infectious diseases, as smallpox; of embolism or thrombosis; of cysts or of tumors. See also PERITONITIS.

MESGOUAT, TROÏLUS DE. See ROCHE, TROÏLUS DE MESGOUAT.

MESHA, mē'shā (Heb. *Mēsha'*). King of Moab during the reigns of Ahab and his sons, Ahaziah and Jehoram, kings of Israel. (2 Kings iii. 4, 5.) According to his inscription, found at Dhiban, Mesha shook off the yoke of Israel and freed himself from the heavy tribute imposed upon him in the middle of the reign of Ahab, and this is regarded by many historians as more correct than the statement in 2 Kings iii. 5 that the revolt took place after the death of Ahab. Subsequently, however, Jehoram secured the aid of Jehoshaphat, King of Judah, his father's ally, or vassal, and the united armies of the two kings were joined by the forces of the King of Edom. The Moabites were defeated, and the King took refuge in Kir-hareseth, his last stronghold. (2 Kings iii. 6-25.) Having in vain attempted to force his way through the besieging army, he withdrew to the wall of the city, and in the sight of the allied host offered up his first-born son and successor as a propitiatory sacrifice to Chemosh, the national god of the Moabites. The biblical narrative suggests (ib., 26-27), though in a vague way, that Chemosh turned to the succor of Mesha; at all events the Moabites remained masters of the situation, and the attempt to reduce them to subjection failed, though their land suffered much in the struggle. The famous inscription of Mesha seems to come from the period after the death of Ahab (c.851 B.C.) and before the invasion of the allied kings (c.849 B.C.). See MOABITE STONE.

MESHED, mēsh'ēd, or **MESHED**. Capital of the Province of Khorasan, Persia, situated 3800 feet above the sea, in the extreme north-eastern part of the country, 460 miles east of Teheran (Map: Persia, J 4). The city is surrounded by a mud wall. It owes its chief importance to the fact that it contains the tomb of the Imam Riza, a descendant of Ali, the founder of the Shiites. The tomb is contained in a mosque which is one of the most magnificent buildings in the East, richly ornamented with gold, silver, and marble. It is visited annually by more than 100,000 pilgrims. The shrine with adjacent territory is sanctuary for criminals. The city is also the centre of several important caravan routes and had a very extensive transit trade with India and Central Asia, which, however, has greatly decreased since the completion of the Russian railroad from the Caspian Sea to Samarkand and the adoption of adverse customs regulations by the Russian authorities. The town still manufactures and exports fine silks, carpets, shawls, and sword blades. Pop., about 60,000.

MESHED-HOSEIN, mē'shēd hō-sān'. A town of Asiatic Turkey. See KERBELA.

MESMER, FRANZ, or FRIEDRICH-ANTON (1733-1815). A physician and founder of the doctrine of animal magnetism, or mesmerism (q.v.), born at Iznang on Lake Constance. He studied theology at Ingolstadt and medicine at Vienna, where he took his degree in 1766. About 1772 he began, along with Father Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion that there exists a

power similar to magnetism, which exercises an extraordinary influence on the human body. This he called animal magnetism, and published an account of his discovery and of its medicinal value in 1775. Honors were conferred upon him in Germany. In 1778 he went to Paris, where he attracted much attention and made a fortune by his famous magnetic cures. His system obtained the support of members of the medical profession as well as of others, but he refused an offer of an annual pension of 20,000 livres (about \$4000) to reveal his secret; and this, combined with other circumstances, gave rise to suspicion and induced the government to appoint a commission, composed of physicians and scientists, whose report was unfavorable to him. He now fell into disrepute, and after a visit to England retired to Meersburg, where he spent the rest of his life in obscurity.

MESMERISM. The name of the process by which, towards the end of the eighteenth century, Franz Mesmer (q.v.), promulgator of the doctrine of animal magnetism, induced the so-called mesmeric trance or sleep. Since Mesmer's day the subject has been transferred from the domain of charlatanism to that of scientific research. The mesmeric trance is identical with the condition known to-day as induced somnambulism, or hypnotism, or the hypnotic state; it has presented to the observer many highly interesting phenomena. In persons who are favorably disposed for passing into the hypnotic state the condition is easily induced by weak, long-continued, and uniform stimulation of the nerves either of sight, of touch, or of hearing. This state is, on the contrary, almost always easily capable of being brought to a close by some strong or suddenly varying stimulation of the same nerves.

The scientific study of the phenomena presented by hypnotized persons is of great interest and has a definite though very limited sphere of usefulness in the cure of mental and functional disorders. Actual harm may result from the practice of hypnotism upon some nervous and impressionable persons. Moreover, the number of those susceptible to its influence is so small that its general use is impossible. For obvious reasons, women should never be hypnotized without reliable witnesses, and the public use of hypnotism can only appeal to the morbid. Hypnotism tends to destroy self-reliance and to make patients imaginative, weak-minded, and neurasthenic. Suggestion (q.v.) is a mighty aid to the physician, and without producing hypnosis, positive and intelligent assertion can accomplish all that is likely to be done by hypnotism short of the somnambulist stage. A fair realization of the part suggestion plays in therapeutics is one of the recent achievements of the most progressive medical minds. See HYPNOTISM; MENTAL SCIENCE; PSYCHOTHERAPY; SOMNAMBULISM; SPIRITUALISM; SUGGESTION.

MESNE (mēn) LORD. In English law, a landlord of whom lands are held in fee who is himself tenant in fee to some superior lord. The lord of a manor containing freehold lands which are held of him in fee, and who in his turn holds his lands of the crown, answers that description at the present time; the superior lord, in this case the King, being the lord paramount. See FEE; FEUDALISM; TENURE.

MESNE PROCESS. All writs, process, or orders made or issued in an action between its commencement by original writ, summons, or

other primary process and the final process by which the judgment of the court is enforced. This term is not employed under modern practice acts in the United States, but is still employed in the "common-law States" and in England. In the "code states" such process is now included in that covered by the term "interlocutory order, judgment, or decree." See EXECUTION; JUDGMENT; SUMMONS; WRIT.

MESNE PROFITS. The reasonable value of the use and occupation of real property during the period in which a trespasser remains in possession, and which may be recovered by the true owner as an incident to his judgment in ejectment. The mesne profits cover the revenue derived by the trespasser from the land during the period of his wrongful possession, including the value of crops gathered, timber cut, etc., as well as the rent received by him. In the ordinary case the mesne profits are estimated by taking the fair and reasonable net rental value of the premises between the original entry by the trespasser and the restoration of the owner in possession and deducting therefrom all reasonable and necessary expenses for repairs and improvements incurred by the trespasser and the amount of any taxes or assessments paid by him. See DAMAGES; EJECTMENT.

MES/OHIP/PUS (Neo-Lat., from Gk. μέσος, *mesos*, middle + ἵππος, *hippos*, horse). A name sometimes applied to one of the fossil horses of Miocene age. See HORSE, FOSSIL.

MESOSINOSITE. See INOSITE.

MES/OLITE (from Gk. μέσος, *mesos*, middle + λίθος, *lithos*, stone). A hydrated sodium-calcium-aluminum silicate that is intermediate in composition between natrolite and scolecite and apparently crystallizes in the triclinic system. It occurs crystallized, in fibrous masses, and sometimes massive, with a vitreous lustre, and in color is white or of light shades of gray or yellow. Mesolite is found in amygdaloid and other volcanic rocks, especially in Iceland, Scotland, in Pennsylvania and Colorado in the United States, and in Nova Scotia.

MESOLONGHI, mēs'ō-lōŋ'gē. A town of Greece. See MISSOLONGHI.

MESONERO Y ROMANOS, mā'sō-nā'rō ē rō-mā'nós, RAMÓN DE (1803-82). A Spanish essayist, born at Madrid. He entered first upon a mercantile career and while thus engaged he collected the material for his *Manual de Madrid*. As a journalist, he collaborated on the *Cartas Españolas*, and in 1836 he established the *Semanario Pintoresco Español*, which he continued to direct until 1842. The best of his essays are to be found in the volumes entitled *Escenas matritenses* (2 vols., 1836) and *Memorias de un setentón* (1880). Those contained in the former collection give faithful pictures of older Madrid, and therefore have a decided antiquarian value; those included in the *Memorias* present much matter that is now very useful to an understanding of the political, social, and literary aspects of the time. Consult: the edition of his *Obras completas* (8 vols., Madrid, 1881); *Trabajos no coleccionados* (2 vols., ib., 1903, 1905); and a good bibliographical note in G. T. Northup, *Selections from Mesonero Romanos* (New York, 1913).

MES/ONYX (Neo-Lat., from Gk. μέσος, *mesos*, middle + ὄνυξ, *onyx*, nail). A fossil creodont mammal found in the fresh-water Eocene formations of Wyoming and New Mexico. A complete skeleton has been mounted in the museum

of Princeton University. It shows the animal to have had a large head, with strong jaws and stout teeth which were able to crush bones. The body is more bulky in front and smaller and weaker behind, with a remarkably long and powerful tail. It resembled in some superficial respects the modern Tasmanian wolf.

MESOPHYLLOUS PLANT (from Gk. μέσος, *mesos*, middle + φίλος, *philos*, dear, from φιλεῖν, *philein*, to love). An objectionable term for plants which grow in intermediate conditions. "Mesophytic" is preferable. See MESOPHYTE.

MES/OPHYLL (from Gk. μέσος, *mesos*, middle + φύλλον, *phyllon*, leaf). The characteristic tissue of a foliage leaf, including all of the tissues of a leaf excepting the epidermis and the veins. The mesophyll cells contain chloroplasts, and therefore are the cells of the leaf engaged in the manufacture of carbohydrates. In leaves of ordinary exposure the mesophyll is differentiated into two regions: (1) palisade tissue, which develops on the upper side of the leaf and consists of elongated cells standing close together and with their long axes at right angles to the plan of the leaf; and (2) spongy tissue, which is developed on the lower side of the leaf and consists of cells loosely arranged, so as to leave a labyrinth of intercellular spaces. In some cases groups of mesophyll cells may become water-storage tissue, in which case they may lose the green pigment. A general term, applied to all green tissue, whether in the foliage leaf or elsewhere, is chlorenchyma (q.v.). In the foliage leaf chlorenchyma and mesophyll are usually synonymous, but the former is the name of a distinct tissue, while the latter is a name of position and may include more than one tissue. See LEAF.

MES/OPHYTE (from Gk. μέσος, *mesos*, middle + φυτόν, *phuton*, growth, plant). A name given to plants which grow naturally in conditions of intermediate soil moisture. The term is thus in contrast with hydrophyte and xerophyte (qq.v.). To this group belong the most common plants of the forest and grass lands of equable climates. Cultivated areas with very few exceptions are mesophytic. Hydrophytes and xerophytes, then, may thus be regarded as extremes, the one adapted to an extreme of moisture, the other of dryness. On account of the almost uniformly favorable conditions mesophytes are able to survive without any striking adaptations such as are to be found among xerophytes and hydrophytes. However, with the exception of a few remarkably plastic hydrophytes, they exhibit maximum plasticity. It is perhaps not surprising that plasticity is found developed to a high degree among them, the sequence of periods of extreme moisture or extreme dryness tending to rigidity of structures. The vegetation of mesophytic areas is much more dense than that in xerophytic or even in hydrophytic regions, and there is a far greater wealth of species. The struggle for existence is thus more keen, and fewer representatives of the various species may be found, while a xerophytic or hydrophytic plant society may often be characterized by the dominance of one or two species. The keen competition which exists in mesophytic regions may perhaps account for the survival of forms with a high degree of plasticity. The various mesophytic societies are treated under the following heads: FOREST; MEADOW; PASTURE; PRAIRIE.

MES/OPOTA/MIA (Lat., from Gk. μεσοποταμία, sc. γῆ, *gē*, country, country between the

rivers, from μέσος, *mesos*, middle + ποταμός, *potamos*, river). In the widest sense, all the country between the Tigris and Euphrates rivers from Armenia to the Persian Gulf; in a narrower and more proper usage, the northern part of this territory, called to-day by the Arab name El Jezirah (the island peninsula), the southern portion (Babylonia) being known as Irak Arabi. In the Old Testament this territory is called Aram Naharayim (the Aram of the two rivers) and Padan Aram (the plain of Aram). The name, in the form Nahrina, is found in Egyptian inscriptions and in the Amarna letters. Concerning the earliest history of Mesopotamia cuneiform descriptions have as yet given no information. If Uspia and Kikia of Asur were Hittites (see ASSYRIA), it is possible that this Asianic people invaded Mesopotamia before the Assyrians carried their arms through the country into Cappadocia in the twenty-third century B.C. The Hittites, who in 1932 B.C. overthrew the first dynasty of Babylon (see BABYLONIA), are likely to have established themselves in Mesopotamia. In the fifteenth and fourteenth centuries the ruling power was the Mitannians (q.v.). Samsi Adad II (c.1870-1840) had already built a temple to Dagan in Tirka, south of the Khabur. After the decline of the Mitannian power Shalmaneser I (c.1320-1290) conquered northern Mesopotamia, and in the treaty between the Hittite King Tudhaliya and the Amorite Benteshina Assyria appears as suzerain in Mesopotamia. Soon after this Aramaean tribes seem to have settled in the land, and strong kingdoms like the Bit Adini established themselves until Shalmaneser III (860-825) and his successors made themselves masters of Mesopotamia. The most important city in the Assyrian period was Haran. In the division between Media and Chaldaea after the fall of Assyria in 606 Mesopotamia fell to the latter. In 538 it passed under Persian rule, and later belonged successively to the Seleucid and Arsacid empires. The chief cities of this period were Edessa and Harran. (See EDESSA; OSRHENE.) The Romans made it a province. In 363 Jovian surrendered most of it to Persia. In the seventh century it came into the hands of the caliphs. After 1055 much of the land was ruled by petty Seljukian sultans. These were in turn conquered by the Mongols, who captured Bagdad in 1258. The Osmanlis began their conquest early in the sixteenth century, and in 1638 the land passed completely into their power. At present the population is mainly Arab; most of the tribes are as independent of the Turkish government as their brethren in central Arabia, though the country is nominally divided between several Turkish vilayets. There are a few Kurds in the north and a small number of Armenian and Syrian Christians. The land is hilly in the north, but low and sandy to the south. After the Euphrates and Tigris, the chief rivers are the Khabur, Jaghjagha, and Belikh. Bitumen is common and a few petroleum wells are found. The most important towns are Urfa, Mardin, Nesibin, Mosul, El Deir, and Rakka. In early times, when a good irrigation system was maintained, the land was fertile, populous, and the home of an advanced civilization. Owing to its situation, it was open to influences from both the east and the west, from Babylonia and Asia Minor. Perhaps its most prosperous time was under Assyrian and Babylonian rule, but in the early Christian centuries it contained important cities, such as

Edessa and Nisibis. To-day it is desert except along the banks of the natural watercourses.

B. Soane, *To Mesopotamia and Kurdistan in Disguise* (London, 1912), containing a bibliography. See ASSYRIA; BABYLONIA, where the works dealing with the earlier history will be found.

MES'OZO'A (Neo-Lat. nom. pl., from Gk. μέσος, *mesos*, middle + ζῷον, *zōon*, animal). A group of animals regarded as intermediate between the Protozoa and Metazoa. The name was proposed in 1876 by E. van Beneden for a group of filiform bodies living in the liquid bathing the "spongy bodies" or venous appendages (kidneys) of cephalopods. They resemble Infusoria, but are two-layered and pass in their development through a gastrula stage. They were named Dicyema by Kölliker, who, with others, considered them as parasitic worms. Van Beneden regarded these forms as constituting the type of a distinct branch or phylum of the animal kingdom. These mesozoans are represented by two types of individuals, differing externally; one (nematogene) producing vermiform embryos, the other form (rhombogene) infusoriform (but many-celled) young. Packard suggested that Dicyema and allies may be degenerate parasitic platyhelminths derived originally from some low cestode or trematode worm. Parker and Haswell (1897) treat of them in an appendix to the Cœlenterata and state that it has been proposed to call them the Planuloidea, from the resemblance which they bear to the planula larva of the cœlenterates. Sedgwick (*Text-Book of Zoology*, 1898) is inclined to regard them as allied to the Trematoda, to the miracidium larva to which he asserts "they do present some considerable resemblance." Consult E. R. Lankester (ed.), *A Treatise on Zoology*, part iv (New York, 1903).

MES'OZO'IC ERA. One of the main divisions of geologic time, following the Paleozoic era and preceding the Cenozoic era. It is subdivided into the Triassic, Jurassic, and Cretaceous periods. See GEOLOGY.

MESPELBRONN, JULIUS ECHTER VON. See JULIUS ECHTER VON MESPELBRONN.

MESQUITE (mēs-kē'tā) GRASS (Sp. *mesquite*; probably of Mexican origin). A name applied to a number of low-growing tufted grasses that occur in greater or less abundance upon the extensive ranges of the western and southwestern parts of the United States. Species of *Aristida* and *Boutelona* are among the mesquite grasses, *Boutelona oligostachya* and *Boutelona curtipendula* being the best known. Curly mesquite is *Hilaria cenchroides*. It forms a dense sward with leafy stems a few inches to a foot high. It matures standing, as do the other species, and is excellent fodder until rotted by the winter rains. While valuable for grazing, it is too low growing to be cut for hay.

MESQUITE TREE (*Prosopis juliflora*). A shrub or tree belonging to the family Legumi-

nosæ, found from central Texas to eastern California, and southward through Mexico and Central America to Chile and Argentina, and also in Jamaica. It is also known as honey locust, honey pod, algaroba, and has been introduced in the Hawaiian Islands, where it is highly prized for its timber, shade, and for its pods, which are an important stock food. In the United States the tree attains its best development in the valleys of western Texas, New Mexico, and Arizona. In some places it is the only tree. According to some botanists the shrubby form is the species while to the larger tree of Arizona and Sonora the name *Prosopis juliflora velutina* is given. There is some doubt regarding the specific identity of the Hawaiian tree. According to its surroundings, the mesquite varies from a straggling, spiny shrub to a widely branched tree 50 feet high and 3 feet in diameter, the latter size being attained in rich valleys where water is available to the deeply penetrating roots. When once established it withstands extreme heat and drought. The wood is exceedingly durable and is much used for posts, house

MESQUITE TREE.

foundations, and similar structures, as well as for fuel. The leaves, which are eaten by stock, have about the same composition as alfalfa hay. The pods, which grow in clusters of from 2 to 10 and are from 4 to 8 inches long, are slender, white or yellow, contain a number of small hard seeds, and are rich in sugar, on which account they are eagerly eaten by cattle, horses, and mules. When eaten without preparation much of the nutritive value is lost, since the seeds are voided without being digested; but when gathered, dried, and ground their value is greatly increased, since the nitrogenous beans are saved. Two forms of gum are produced by the mesquite tree. One, resembling gum arabic, exudes as small clear or amber-colored drops from the trunks. It makes an excellent mucilage, and has been employed in laundries and for confectionery. The other, obtained from wounds in the trunks, occurs in black, brittle, larger masses. It contains as much as 20 per cent of tannin, and with some form of iron is used by the Mexicans as a black dyestuff. During the flowering period, which lasts for about two months, the trees are visited by bees for the abundant nectar, which makes a clear honey of very agreeable

flavor. Mexicans make a cathartic by pounding the inner bark in water and adding salt to the mixture. A second species, *Prosopis pubescens*, is known as the screw bean or curly mesquite. It is a shrub or small tree growing in situations similar to the previous one. Its pods are spirally curled into close rigid cylinders. The uses of this species are very similar to those described above.

MESS (OF. *mes*, Fr. *mets*, dish (of food), It. *messò*, *messà*, course at table, from Lat. *missus*, p.p. of *mittere*, to send). A military and naval term originally signifying a dish or portion of food, but now used in the sense of a number or association of officers or men taking their meals together. The officers' mess or messes at an army post in the United States army are established and have quarters assigned for such purpose, under the supervision of the commanding officer. In campaign company officers usually mess with their organizations. Battalion officers mess with the companies or provide their own. The regimental commander and his staff form one mess or may mess with the band. To reduce transportation the superior commander may require all officers to mess with organizations. Whenever possible the enlisted men mess together by companies, under the supervision of the captain. An officer appointed by the post commander has charge of the "general mess" for enlisted men when such a mess is authorized and created by combining several companies. In campaign enlisted men mess by company when possible. Often it is necessary to mess in squads or have individual cooking.

The system of messing, as regards the soldier, is practically the same throughout Europe, varying in comfort and food according to the country and army organization.

On board ship the admiral messes alone or with the captain, if agreeable to both. The ward-room mess includes all ward-room officers. The junior officers (ensigns, if not in the ward room, naval cadets, pay clerks, etc.) have a separate mess room, as have also the warrant officers (boatswains, gunners, carpenters, warrant machinists, pharmacists). The enlisted force in most ships forms the "general mess." The men are divided into convenient units or messes, according to the size of the tables; the chief petty officers and those of the first class have their own tables, and when possible are granted special privileges in their messing arrangements. In ships on board which the "general mess" system has not been established the crew is divided into several messes, according to the number.

To each officers' mess in the navy are allotted a cook, steward, and servants, the number of the latter depending upon the number of officers in the mess. The servants (or mess attendants, as they are called) are not merely waiters and personal attendants, but in action they are ammunition passers.

MESSA DI VOCE, mēs'sà dē vō'chà (It., setting of the voice). A term used in the art of singing, meaning the gradual swelling and again diminishing of the sound of the voice on a note of long duration.

MESSAGE, mē'sà'zhà', ANDRÉ CHARLES (1853-). A French composer and conductor, born at Montluçon. He began his musical studies at the Ecole Niedermeyer in Paris and completed his training under Saint-Saëns. In 1876 he won the prize offered by the Société des Compositeurs Français for the best symphony.

For a number of years he was organist at St. Paul's in Paris, until the success of some lighter operas secured him the position of conductor at the Opéra Comique in 1898. From 1901 to 1907 he was the artistic director at Covent Garden. In 1907 he was appointed first conductor at the Grand Opéra in Paris, and at the same time joint director with Broussan. He resigned the directorship in 1914, but continued as conductor. He directed the first Paris performance of *Parsifal*. In 1908 he succeeded Marty as conductor of the Concerts du Conservatoire. His compositions (almost exclusively operas) include *La fauvette du temple* (1885); *La basoche* (1890); *Mme. Chrysanthème* (1893); *Le Chevalier d'Harmental* (1896); *Les petites Michus* (1897); *Véronique* (1898); *Les dragons de l'impératrice* (1905); *Fortunio* (1907); *Beatrice* (1914).

MESSALA CORVINUS, MARCUS VALERIUS (c.70 B.C.-c.1 B.C.). A Roman soldier, orator, and patron of letters. He was educated in part at Athens, and, having returned to Rome after Caesar's assassination and previous to the formation of the second triumvirate, became a member of the Senatorial party. He was third in command of the Republican army at Philippi, and stormed the camp of Octavius, whom he almost captured. Having escaped, with a fairly well organized force, to the island of Thasos, he later accepted terms from Antony, against whom, however, at Actium, he brilliantly commanded the centre of Octavius' fleet, and whose abrogated consulship he filled (31 B.C.). Appointed proconsul of Aquitania, he completed the reduction of that province and received a triumph. He was also at one time a prefect in Asia Minor, and became a special member of the College of Augurs. He was reckoned, with Gaius Asinius Pollio, the last orator of the old school. He was a liberal patron of men of letters, of a group distinct from that which gathered under the auspices of Mæcenas. Consult Wiese, *De Corvini Vita et Studiis Doctrinæ* (Berlin, 1829), and the article "Valerius, 43," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

MESSALIANS. See MASSALIANS.

MES'SALINA, VALERIA. The most infamous woman in the annals of the Roman Empire. She was the daughter of M. Valerius Messala Barbatulus, and third wife of the Emperor Claudius, whom she married before his accession in 41 A.D. (See CLAUDIUS I.) Taking advantage of the weakness and stupidity of the Emperor, she indulged in the most wanton and flagrant atrocities, both moral and political. If we are to judge by the Roman historians, her character was unspeakably vile, and her boundless ambition could be satisfied only with the destruction of all who seemed to thwart her plans. The best blood of Rome flowed at her pleasure. She retained her influence over the Emperor, who remained unaware of her infidelities; but when, during a short absence of Claudius from Rome, she actually committed the folly of going through the forms of a public marriage with C. Silius, whom she had compelled to divorce his wife, the affair was brought to the Emperor's attention by the freedman Narcissus, and Claudius reluctantly gave orders for her death. She was killed by a tribune of the guards, 48 A.D. Consult: Stahr, *Römische Kaiserfrauen* (Berlin, 1865); Tacitus, *Annales*, xi, 1-38; *Juvenal*, vi, 115-135; x, 333; xiv, 331; J. B. Mayor on *Juvenal* at the places cited.

MESSANA. See MESSINA.

MESSA'PIA (Lat., from Gk. Μεσσηπία). The name applied by the Greeks to Calabria (in the classical sense), a peninsula in the southeastern part of Italy, extending from Tarentum to the Iapygian Promontory. The chief towns were Rudia, where Ennius (q.v.) was born, Brundisium (see BRINDISI), Uria, and Uzuntum. The Messapii, inhabitants of this part of the country, were known also as the Iapyges, or Iapygii. Their language survives in some inscriptions, about 50 or 60 in number, consisting mostly of proper names. On these consult: Theodor Mommsen, *Die Unteritalischen Dialekte* (1850); A. Torp, *Indogermanische Forschungen*, vol. v (1895); R. S. Conway, *The Italic Dialects* (2 vols., Cambridge, 1897); I. P. Droop, *Annual of the British School at Athens*, vol. xii (Athens, 1905-06).

MESSENE, mēs-sē'nē (Lat., from Gk. Μεσσηνή). The capital of Messenia, in the Peloponnesus, founded by Epaminondas (369 B.C.) (Map: Greece, Ancient, B 3). It lay at the foot of Mount Ithome, surrounded by a stone wall 5½ miles long and of great strength. This wall is still well preserved in places, especially at the Arcadian Gate, which is an exceptionally fine example of Greek fortification. The stadium, theatre, and other ruins can be easily traced, and excavations in 1895 by the Greek Archaeological Society brought to light a fine colonnade and other remains of the ancient agora.

The town was settled by the descendants of the ancient Messenians (see MESSENIA), whom Epaminondas invited to return, and was therefore the hereditary enemy of Sparta, contributing not a little to the continual internecine strife which marks the history of the Peloponnesus from the middle of the fourth century B.C. to the Roman conquest. The modern Messene, or Nisi, is some distance from the ancient site, which is partly occupied by the little village of Mavromati. Consult K. Baedeker, *Greece*, pp. 410-412, with plan (4th Eng. ed., Leipzig, 1909).

MESSE'NIA (Lat., from Gk. Μεσσηνία). A district in the southwest part of the Peloponnesus, bounded on the east by Laconia, on the north by Arcadia and Elis, and on the south and west by the sea (Map: Greece, Ancient, B 3). It consisted of extensive plains, watered by the Pamisus and other streams. These plains were famous for their fertility, and particularly for their wheat harvests. At an early period, after the Doric conquest (see DORIANS), it rose to power and opulence. Its chief cities were Methone and Pylos. In late times Messene was the capital. Messenia is chiefly noted for its two wars with Sparta, known as the Messenian wars, the first of which seems to have occurred in the eighth century B.C., the second (of which Aristomenes is represented as the hero) in the second half of the seventh century B.C., though the authorities on which our accounts of both wars rest are far from satisfactory. In both instances the Messenians were defeated, and after the second war a part of the population emigrated to Sicily. The peopling of Messana (see MESSINA) was much later. The remainder of the inhabitants were reduced to the position of helots. A revolt of the latter, who fortified themselves on Mount Ithome and held out for 10 years, is known as the Third Messenian War (464-455 B.C.). The invasion of the Peloponnesus by Epaminondas in 370-369 led to the

return of the Messenians to their land (see MESSENE) and the revival of their old state, which continued independent, though in alliance at times with the Macedonians, until the Roman conquest (146 B.C.). Messenia is the name of one of the nomarchies of the modern Kingdom of Greece, with Kalamata as its capital. Consult: C. Bursian, *Die Geographie von Griechenland*, vol. ii (Berlin, 1868); A. Philippson, *Der Peloponnesus* (ib., 1892); J. G. Frazer, *Pausanias*, vol. iii (2d ed., New York, 1914).

MESSIAH (transliterated in Gk. *Messias*, *Messias*, or *Meas*, from Aram. *Mashiha*, the *h* having been slurred over in pronunciation, the equivalent of Heb. *ha-Mashiah*, the anointed, translated into Gk. *χριστός*, *Christos*, Christ). A title given to the king or pontiff in ancient Israel and Judah because of his anointment as vicegerent of the deity and ruler of the people, and in later times a designation of the expected deliverer from foreign oppression and founder of a world-wide Jewish empire. Saul (1 Sam. xii. 3, 5, xxiv. 7, 11), David (2 Sam. xix. 21, xxiii. 1), and Zedekiah (Lam. iv. 20) are spoken of as Yahwe's anointed. In Isa. xlv. 1 the title seems to be applied to Cyrus; doubts, however, have been expressed, both on metrical and other grounds, as to whether the words "to Cyrus" formed a part of the original text. (See **ISAIAH**.) The anointed priest referred to in Lev. iv. 3, 5, 16 is clearly the high priest, who, during the Persian period, was the head of the state and therefore was spoken of as the Messiah, the anointed one, quite as naturally as the kings of preëxilic times. The same custom evidently continued in the Ptolemaic and Seleucid periods, as Joshua ben Jozadak is alluded to as the anointed prince in Dan. ix. 25, and the cessation of the legitimate high-priesthood is expressed by the phrase "the anointed is cut off" in Dan. ix. 26. (Cf. Wellhausen, *Israelitische und jüdische Geschichte*, 7th ed., p. 234, Berlin, 1914.) The priest kings of the Hasmonæan dynasty, as possessors both of the throne of David and the pontificate, naturally received this title. (See **MACCABEES**.) Ps. xviii. 50, xx. 6, xxviii. 8, lxxviii. 10, lxxxix. 39, 52 are regarded by many scholars as referring to some of these rulers, though it is doubtful in some instances whether one of the actual kings, Aristobulus I and Alexander Janæus, or a princely pontiff like Jonathan, Simon, or John Hyrcanus is meant. There appears to be no passage in the Old Testament in which the title is unmistakably used with reference to a future monarch. It has been thought, however, that this is only an accident, and that such an eschatological figure is alluded to here and there under other names. Thus, Shiloh (Gen. xlix. 10), the star (Num. xxiv. 17), the Prince of Peace (Isa. ix. 6), the branch (Isa. xi. 1), Immanuel (Isa. vii. 14), the righteous Shoot (Jer. xxiii. 5), my servant David, and the shepherd (Ezek. xxxiv. 23, xxxvii. 24) have been considered by some scholars as possibly designating the Messiah. They have sought a justification for expecting such veiled allusions in certain Babylonian and Egyptian prophecies that have recently come to light and seem to them to point to analogous eschatological speculations among the nations by which Israel and Judah were influenced. Thus, Zimmern has called attention to a cuneiform inscription describing a time of prosperity when a righteous king shall reign over the land. (*Zum Streit*

um die Christusmythe, Leipzig, 1910.) A Petrograd papyrus, a wooden tablet at Cairo, and an ostrakon at Liverpool contain a prophecy which is said to have been made by a priest in the time of Snefru, but probably belongs to the twelfth dynasty, predicting (ex eventu) the power and prosperity of the founder of this dynasty, Amenemhat I. The admonitions of the sage Ipuwer to a king of the nineteenth dynasty in a Leyden papyrus, published by Gardiner (*The Admonitions of an Egyptian Sage*, Leipzig, 1909) and interpreted also by Breasted (*Religion and Thought in Ancient Egypt*, New York, 1912), speak of a shepherd of men in whose heart there is no evil, and ask "Where is he to-day? Doth he sleep perchance? Behold his might is not seen." The text is obscure, and it is not clear whether the sun god Re, or a future king, or even the monarch addressed is intended. While these texts are fragmentary, of doubtful interpretation, and insufficient to prove a connection of prophetic speculation in general, and the Messianic idea in particular, with Babylonian and Egyptian thought, there is nothing strange in the expression of the hope for a good king, and it would not be remarkable if certain designations of a great and noble ruler should prove to have been used by different peoples, independently or through imitation. Nor can it be affirmed a priori that the Hebrews could not have associated with kingship, present or future, that divine character which is so clearly assigned to it in ancient Egypt at all times and in Babylonia in the earliest periods. But thus far the evidence adduced is quite inconclusive. It is by no means certain that Shiloh is a name; the star in Balaam's oracle seems to point to David; Immanuel appears very clearly to be the name which a woman in Isaiah's time, expecting soon to be a mother, will give to her child; a descendant of the old royal family living in the exile seems to be referred to in Isa. ix. 6, xi. 1; and the same is likely to be the case with the passages in Jeremiah and Ezekiel alluding to my servant David (a David redeivus), the righteous Shoot, and the shepherd. As ampler material for such comparative study of ancient eschatology is brought to light it is possible that one or the other of these terms may appear more likely than is the case to-day to be veiled allusions to the Messiah. Critical scholars find it extremely difficult to discover any passage in the Hebrew Bible that refers to the Messiah as a future deliverer. The Psalter of Solomon, however, can no longer be pointed out as containing the earliest distinct and unmistakable reference to this Messiah; for it is probable that the Documents of the Covenanters of Damascus, published by Schechter (*Fragments of a Zadokite Work*, Cambridge, 1910), in which the hope of a coming Messiah is expressed, were written as early as c.100 B.C., and the sect to whose tenets this belief no doubt belonged from the beginning was formed soon after the overthrow of the legitimate Zadokite pontificate by the Tobiads in the reign of Antiochus IV (175-164 B.C.). The Messiah expected by these Covenanters was to come in the future from Aaron and Israel, not from David and Judah. Unless it hides under some cryptic forms, the figure of the eschatological Messiah would, therefore, seem to appear in literature as a coming high priest somewhat earlier than as a coming king.

But the elements out of which the Messiah as

an eschatological magnitude was formed had long been in existence. There had been a tendency to attach much importance to the anointing of rulers. From Saul to Zedekiah, from Joshua to Aristobulus II, the leader of the state, whether king, pontiff, or priest king, had been consecrated with oil. Originally unction was an application of sacrificial fat. The pouring of oil upon the stone in which the divinity dwelt was a sacrifice. The King was a holy being to whom this offering was made. With the anointing a spirit entered into him (1 Sam. xvi. 13); he was sacrosanct, his body must not be touched (1 Sam. xxiv. 10); he was gradually removed from the gaze of the people and seen only by his officials (2 Kings xix. 15). The pontiff as ruler of Israel was Yahwe's anointed, a son of oil (Zech. iv. 14), having access to the celestial court (Zech. iii. 7). It is held by some scholars that in the Hasmonæan age the priest king by virtue of his anointment was regarded as Yahwe's Son and as a god sitting on his throne. (Ps. xlv, lvii, lxxxii.) It is not considered strange by those holding this view that a victorious king engaged, as it seemed to his admirers, in the conquest of the world should at that time have been addressed as god by a court poet. (Ps. xlv. 6.) There had also been a tendency to repose extraordinary faith in the dynasty founded by David. The reason for this may have been its remarkable longevity; perhaps also its promised prosperity. As long as princes of this family lived and received signal honors at the hands of Chaldean and Persian kings, as was the case with Jehoachin, Sheshbazzar, and Zerubbabel, the hope of national independence naturally connected itself with these shoots of the old stock. Thus, the elevation of Jehoachin from his dungeon to royal dignity in 561 B.C., and the birth of his son, Sinpalazur (Sheshbazzar), seem, according to some scholars, to have led a poet to express the hopes of Isa. ix. 1-6, xi. 1-6, and the presence of Jehoachin's grandson, Zerubbabel (q.v.), as governor in Jerusalem at the beginning of the reign of Darius Hystaspis raised expectations of his restoring the old dynasty. (Hag. ii. 23; Zech. viii. 8, iv. 6 et seq., vi. 12.) The gradual disappearance of prominent members of the Davidic family no doubt gave room for independent aspirations. Sanballat (q.v.) may have been right when he declared that prophets in Jerusalem had announced Nehemiah as the coming King. (Neh. vi. 7.) Simon became Prince as well as high priest, and Aristobulus I King, without belonging to the Davidic family. But the strength of the legitimist feeling may be seen both in the fiction by which the occupant of David's throne was designated as his son, and in the indignant protest of the Pharisees against this fiction. This loyalty to the legitimate line, and the increasing difficulty of finding a leader who should also be a genuine descendant of David, necessarily removed into the future the Messianic King. Of great importance was also the tendency, always strong in Israel, to look beyond present conditions for better things to come. While the great prophets before the Exile announced impending judgment, there were always those who held up cheerful pictures of the future to the people. After the Exile it was especially the author of Isa. xl. et seq. who inspired hope and courage by his promises of good. He indeed did not look forward to a Messiah, but he did much to develop that apocalyptic mood

out of which this figure was born. The same is true of the Book of Daniel, which seems to have been written in part in the third century and in part in the year 165 B.C. It reveals a marked growth of the apocalyptic imagery, but the Messiah holds as yet no place among its eschatological figures. The manlike being appearing on the cloud (chap. vii) is probably Michael, the celestial representative of Israel. The Maccabæan uprising and the establishment of a native dynasty encouraged this disposition to map out the future. But while Yahwe's anointed actually sat upon the throne of David and was conquering the neighboring nations, there was no reason for putting the Messiah in the future. The atmosphere of the Psalter is saturated with a desire for divine judgment upon the heathen nations and breathes a pathetic confidence in the dynasty occupying the Davidic throne. The enthusiasm seems to have been shared by the Egyptian Jews. In the *Sibylline Oracles* (iii, 652 et seq.) there seems to be a reference to Simon as a godsent king who will put an end to evil war. From the standpoint of the Erythræan Sibyl, Simon may be said to be a king sent from the sun, even as Cyrus is called a king from heaven (iii, 286). The passage was probably written in the time of Ptolemy IX, Euergetes II (145-117 B.C.). Ethiopic Enoch i-xxxvi, written in the reign of John Hyrcanus (135-104 B.C.), contains no allusion to a king, and Ethiopic Enoch xc, 37, 38 seems to be a late addition to the book lxxxiii-xc, which apparently was written c.106 B.C. An elaborate eschatology had thus been developed in which the Messiah, according to this view, held no place. On the other hand the overthrow of the Zadokite high-priesthood and the assumption of the pontificate by the illegitimate line of Tobiad and Hasmonæan rulers appear to have led the Zadokites to look hopefully for a Messiah from Aaron and Israel, i.e., a high priest of the old line, not a son of David and member of the tribe of Judah. But the way was prepared by veneration for the anointed ruler of the state, loyalty to the old dynasty, the Davidic or the Zadokite, and speculation about the world's future. Roman oppression caused a fusion of these elements. The anointed king that was needed must be a genuine son of David, and as no claimant to the throne of the legitimate line presented himself, he necessarily belonged to the future. The Roman yoke was all the more galling as the Jewish people had for a century indulged in a dream of empire and imagined itself in the midst of the actual conquest of the world. But even this cruel disenchantment could not quench the spark of ambition. The Pharisees saw the cause of the calamity in the Hasmonæan usurpation of the throne of David, as the *Psalter of Solomon* shows, and looked to God to provide the genuine Son of David, strengthening their faith by the prophetic word. They understood the Psalms of David to be songs indited by the great monarch, and naturally interpreted the language in which the actually reigning King had been referred to as prophecies of the coming Messiah. Similarly, the words of ancient prophets originally referring to their contemporaries of the Davidic family or to the dynasty itself were explained as divine announcements of the coming deliverer. But in spite of this support in the popular exegesis of the Bible, the Messianic hope seems to have been cherished only in limited circles. Whether the idea was influenced at the outset by

Mazdayasnian thought is doubtful; in its later development it may have borrowed some features from the Saoshyant (q.v.). This Persian Messiah has no political character. He was expected to raise the dead and to renew the world. (*Yasht*, xix, 92 et seq.) The Messianic idea seems to have had little hold upon the Alexandrian Jews. It is not certain that the translators of Isa. ix. 5 and Ps. cx. 3 had the Messiah in mind; in Num. xxiv. 7 the Davidic house is meant, and the rendering of Gen. xlix. 10, "he is the expectation of the nations," is not likely to be original. It is doubtful whether *Sibylline Oracles*, iii, 46-62, 75-92 belongs to the time of the first triumvirate and Cleopatra or to the time of Galba, Otho, and Vitellius; in the latter case the widow is Rome, and the holy ruler may be none else than the immortal God and great king mentioned in the same connection. The Book of Wisdom contains no allusion to the Messiah. Philo declares that the Israelites shall return to Palestine "led by a divine or more than human apparition" (*De Exsecrationibus*, iii, 437), and that if the future kingdom of peace shall be disturbed a man will come, according to the promise, to subdue the nations, God granting to the pious auxiliaries in psychic power and physical strength (*De Præmiis et Pœnis*, ii, 421-428). But he seems to have thought of the divine glory and of deliverance through manly qualities rather than through a man. The Slavonic Enoch knows nothing of a Messiah. The same silence concerning this figure is found in such Palestinian works as *Ecclesiastes*; the *Assumption of Moses* (i-vi), written in the beginning of our era; the *Book of Jubilees*; and the original *Testaments of the Twelve Patriarchs*. It is held by many that, aside from the *Psalter of Solomon* there is no unmistakable reference to the Messiah in any literary production that can be dated with certainty as earlier than the time of Jesus. But the description given in this work (xvii, xviii) of the coming king shows with sufficient clearness that some men in Israel in the first century B.C. looked forward to the appearance of a descendant of David, who would be a conqueror of nations and a righteous ruler and whom they called the Messiah. And the recent discovery of the Zadokite work (see ZADOKITES) has shown that the term was applied in the second century B.C. to the expected high-priestly ruler, the Messiah from Aaron and Israel. According to Matt. xxii. 15, 16 (Mark xii. 13) there was a party of the Herodians. Tertullian declares that "the Herodians said Herod was the Christ." (*Præscr.* 45.) It is not improbable that the King who built the most splendid temple Jerusalem had ever had and restored the Davidic kingdom, even though it was by the favor of Rome, was thus looked upon as the promised Messiah by his courtiers. Judah of Gamala in Galilee seems to have been regarded as the Messiah by many and undertook an insurrection in 7 A.D. (See JUDAS OF GALILEE.) He was supported by Zadok, a disciple of Shammai. The immediate cause of the rebellion was the census of Quirinius on the accession of Archelaus. He was put to death, but his followers continued as a sect. (Josephus, *Wars*, ii, 118.)

Jesus of Nazareth was crucified under Pontius Pilate as a political criminal claiming, in defiance of the authority of Rome, to be King of the Jews. It is believed by some that he never claimed himself to be the Messiah. The Synoptic Evangelists believed, indeed, that he was the

Messiah. But this belief may have been based on the conviction that he had been raised from the dead. For a time, at any rate, he avoided assuming any distinctive Messianic title, and on several occasions forbade his disciples to say that he was the Messiah. From their point of view they could explain this attitude only as a persistent attempt to keep his Messiahship a secret. This secret was known to God, who might in due time reveal it, and to the demons, who were punished for prematurely announcing it, but not to men. The disciples seem, however, to have regarded the term Son of Man as a self-designation of Jesus by which he intended to hint at his Messianic claims without directly disclosing them. But this belief, it is argued, may have been erroneous, and so indefinite a term as "man" cannot very well have been a Messianic title and is not found in Jewish literature as such. The life and teaching of Jesus offended all influential parties in the nation, while the enthusiasm and indiscretion of his disciples readily furnished immediate excuse for a false accusation. Pilate could scarcely avoid regarding him as a disturber of the peace and handed him over to be crucified on the ground of the loose charge preferred against him. Similarly, there is no evidence that John the Baptist regarded himself as the Messiah, though his disciples at a later time may have considered him as such.

According to the traditional view, still held by many Catholic and Protestant scholars, the Messianic belief was embedded in Hebrew history and interwoven with the deepest life of the people. The promises which formed and fed it are thought to reach back to the earliest Jewish annals, and the belief itself is regarded as resting upon traditions coeval with the origin of the human race. The Messianic idea is supposed to have been inseparably connected with the provision for the redemption of man after the fall and gradually unfolded through the history of the chosen people.

From this standpoint the evolution of the Messianic idea is traced through four distinct epochs, three within the limits of the Hebrew canon and the fourth outside it. The first of these ends with Moses. In the protangelium there is the primal promise. The seed of the woman is to bruise the serpent's head. This promise takes shape in the family of Abraham, in whose seed all the nations of the earth are to be blessed. Paul argues in Gal. iii. 16 that the seed is a personal Messiah. His characteristics are gradually unfolded in the Shiloh of the dying Jacob (Gen. xlix. 10), in the star of Balaam (Num. xxiv. 17), and the prophet of Moses (Deut. xviii. 18, 19), as the lawgiver, teacher, and deliverer of Israel. The second period centres in the reigns of David and Solomon. The promise of a kingdom to David and his house forever is regarded as precluding a mere continuation of his dynasty on an earthly throne, but implying a superhuman royalty of which there is supposed to be a series of pictures in the Messianic psalms, which are believed to be pervaded with the expectation of a coming deliverer. In Ps. ii, xlv, lxxii, and cx, e.g., this traditional interpretation sees a picture not only of the Messiah's inheritance and the blessings and extent of his kingdom, but of the King himself reigning among men and bringing to his subjects righteous judgment, salvation, and redemption. He is both priest and king. He is David's Lord

as well as his son. His empire is spiritual. Its rule is world-wide and time-embracing. He is to reign until his enemies become his footstool. The third period extends to the close of the Hebrew canon and includes, according to tradition, the richest mine of Messianic prophecy in the Old Testament. Messiah as the servant of God is regarded as the central figure of Isaiah's prophecies. This expected king, this root of Jesse, will "stand for an ensign of the people." He will be the rallying point of the world's hopes, the true centre of its government. (Isa. xi. 10.) He is portrayed as the mighty God, the everlasting Father, the Prince of Peace. (Isa. ix.) The picture of the suffering servant of Yahwe in the fifty-third chapter is considered as a prophetic anticipation of the events in the judgment hall of Caiaphas and before Pilate's bar. Jeremiah is supposed to have depicted the future deliverer as a king executing judgment and justice in the earth (Jer. xxiii. 5) and Zechariah is thought to have painted him as an enthroned priest (Zech. vi. 13). Daniel vii, according to this view, applies to the coming Messiah the title Son of Man, whose dominion is "an everlasting dominion which shall not pass away." Finally Malachi is held to have referred to him as the angel of the covenant, whom Israel was seeking and who would "suddenly come to his temple." (Mal. iii. 1.) The fourth epoch extends from the close of the Hebrew canon to the beginning of the Gospel era. Among the Jews of Alexandria the Messianic hope at this time is supposed to have deteriorated, while among the Palestinian Jews it survived and flourished. The Hellenized peoples would naturally be absorbed in the current speculations regarding the Sophia and the Logos and long absence from Palestine, and a hesitancy to avow startling beliefs among unfriendly critics, would tend to quench all interest in the future of Jewish nationality. Nevertheless the expectation of a Messiah existed both among the common people and in more intellectual circles at the beginning of the Christian era. The Galilean peasantry and the Pharisees alike expected the fulfillment of the national hopes. An oppressed and suffering people naturally looked for a secular prince who would free them from the heathen yoke, and when Jesus entered upon his public ministry, Messiahship meant to the masses and the classes of Jewry simply emancipation from Roman rule. But Jesus did not lend himself to this type of Messiahship. He is supposed to have claimed to be the divine Messiah of David and Isaiah. The conversation between him and Peter at Cæsarea Philippi is understood as implying on his part an acceptance of the Messianic title, and Peter's confession is taken as the supernaturally imparted recognition of Jesus as the Messiah. In the Fourth Gospel the same designation of him is used by the Samaritan woman (John iv. 25, 26) and accepted by Jesus, and Andrew says to his brother Simon: "We have found the Messiah, which is, being interpreted, the Christ" (John i. 41 et seq.).

According to the traditional view, the title Son of Man was the Christ's self-chosen designation of himself. To Jewish ears it is supposed to have been a clear assertion of Messiahship. Some think that in consequence of the prophecy of Daniel it became a popular and official title of the Messiah. In one part of the Book of Enoch (q.v.), which, however, is of uncertain date, the judgment day of Messiah, identified

with Daniel's son of man, stands in the forefront of the eschatological picture. Jesus, when standing at the tribunal of Caiaphas, is reported as having said to his judges: "Hereafter shall ye see the Son of Man sitting at the right hand of power and coming in the clouds of heaven" (Matt. xxvi. 64), and a similar prediction is found in his prophecy over Jerusalem (Matt. xxiv. 30). Those who accept the genuineness of these sayings think that it was no merely generic title, but the constant setting forth of his Messianic claims, and that it brought down upon him the wrath of the scribes and Pharisees. The Sanhedrin, the highest court of Jewry, is supposed to have condemned him because he claimed divinity. "We have a law and by our law he ought to die because he made himself the Son of God," said the members of this court to the Roman governor, according to John xix. 7. "He hath spoken blasphemy," cried the high priest, according to Matt. xxvi. 65.

It should also be stated that between the critical estimate first given and the traditional interpretation just outlined many scholars have assumed a mediating position, rejecting the bulk of supposed Messianic prophecy and the accuracy of the New Testament interpretation of it, while still maintaining that Jesus regarded himself as the Messiah and gave to the Messiahship as to the kingdom a more spiritual significance.

In 37 A.D. a Samaritan appeared as a leader of a rebellion in Tirathana. Precisely what claims he made for himself is not clear from the account of Josephus (*Ant.*, xviii, 85 et seq.). There are many indications that after this time a more transcendental character was given to the Messianic conception, not only among the Jews who looked forward to a return of Jesus as the Messiah, but also in other circles of Jewry. Theudas, who announced himself as the Messiah in the reign of Claudius, did not depend upon military strength or political diplomacy, but looked for a miraculous establishment by God of the Kingdom of Israel in place of the Roman Empire. He was beheaded by Cuspius Fadus in 46 A.D. (Josephus, *Ant.*, xx, 97 et seq.) The Egyptian (c.58 A.D.) mentioned by Josephus (*Ant.*, xx, 169 et seq.) probably claimed to be only what the historian calls him—a prophet. But Menahem, son of Judah, the Galilean, who appeared during the siege of Jerusalem, led the attack upon the Roman garrison clothed in royal garments and fell a victim of his Messianic pride and arbitrariness. An apocalyptic fragment of Jewish origin, preserved in Rev. xi. 1, 2, xii, sets forth figuratively how the Messiah has already been born, but is hidden secure against Roman persecution, to appear in due time. This idea that the Messiah has been born in the Jewish community, but has already as a child been translated, is similar to the conception found in the Babylonian Talmud (*Sanhedrin*, 98 b), where the Messiah is a deceased descendant of David who rises from the dead to accomplish the delivery of Israel. Both of these notions were due to the conviction that God would provide a genuine son of David. A translated hero would naturally return on the clouds of heaven. Thus, in the *Apocalypse of Baruch*, written after the fall of Jerusalem, the Messiah is "revealed" (xxix, 3, xxxix, 7) and "returns in glory" (xxx, 1) to rule until the world of corruption is at an end (xl, 3), sparing some and putting others to death (lxxii, 2-6). In the *Apocalypse of Ezra*, written c.97 A.D., the Mes-

siah is to be revealed during 400 years and then die together with all men, whereupon the present age will end and a new world begin, after seven days of silence, with the resurrection of the dead and the appearance of the Most High on the judgment seat (vii, 28 et seq.). The woman that brings forth a child, as in Rev. xii, loses him when she is about to give him a wife and flees into the wilderness (ix, 43 et seq.). The lion rebuking the eagle is said to be the Messiah, who has been preserved for the end from the seed of David (xii, 3 et seq.). Finally the manlike or angelic being that rises from the sea and flies with the clouds of heaven, destroying an army with the fire proceeding from his mouth, is declared to be the Messiah (xiii). In spite of the marked influence of Jewish-Christian thought, the emphasis is strongly put upon the assertion that God is not to judge His creation through any one (v, 56, vi, 6). It is possible, however, that even this step was taken by the Jewish interpolator of the parables of Enoch. (See ENOCH, *Books of*.) In the original vision God alone is the judge and there is no Messiah; but the book seems to have been annotated and expanded by a writer who looked forward to the revelation of a chosen instrument, not merely for the punishment of the nations, but for the judgment of the world—a man destined to sit upon a glorious throne to judge angels and men (xlv, 3, 4, xlv, li, liii, 6, lv, 4, lxi, 8, 9). This picture has finally been retouched by a Christian hand. The Aramaic original is lost, but even the Ethiopic translation renders it possible to distinguish between the early passages, where a *bar nasha* in the generic sense of man occurred, and the places where the Christian title has been subsequently introduced. The original work may have been written in the time of Caligula, and the Jewish expansion in the reign of Domitian. After this a reaction against the transcendental Messianic idea set in. This was developed in Christianity as it separated itself from Judaism. The Messianic idea became fused with metaphysical speculation of Greek origin to such an extent that ὁ *χριστός*, “the anointed one,” the etymological equivalent of “the Messiah,” finally conveyed a meaning absolutely foreign to the original conception.

The figure of Simon bar Kozeba (or Bar-Cochba) was probably as close a realization of the popular Jewish ideal of a Messiah as history ever produced. Of him alone can it be said that he was not only recognized by his people as the Messiah at a time when the Messianic idea had reached its full development and regarded himself as such, but also succeeded temporarily in redeeming Jerusalem from foreign oppression. In less than a year he conquered 50 fortified cities and 945 towns and villages. His army consisted of 200,000 men. For two years and a half he reigned as King. Only after 52 battles could Julius Severus vanquish him in 135 A.D. There is something sublime in this King of Zion bidding Imperial Rome defiance. The terrible persecutions that followed the Hadrianic insurrection did not quench the Messianic hope. This is shown by the “Eighteen Prayers”; by Trypho, who told Justin Martyr that all Jews believed the Messiah would come, a man born of men; and by Celsus, who in 178 A.D. no doubt correctly represented his Jew as cherishing this expectation. The Targums also indicate its continuance. The idea of a Messiah ben Joseph who is to rule until Messiah ben David comes may be an early

Jewish concession to the Ebionitish Christians who believed that Jesus was the son of Joseph; or it may be another form of the belief, already met with in the Documents of the Damascus Covenanters, that the Messiah would come from Israel and not from Judah. Only in late writings is there any reference to a suffering Messiah, though the notion of sufferings of Israel previous to the establishment of the Messianic kingdom is common. The end of the Roman Empire and the victories of the Mohammedans naturally stirred afresh the hope of a return to Palestine and the coming of the Messiah. In 716-721 Serenus, a Galilean, appeared as a Messianic reformer, after the fashion of Mohammed, rejecting certain rabbinic regulations as to food and marriage and gaining many followers. But when he was brought to task by Yazid II, the Omniad Caliph, he lacked the courage of his convictions and was handed over to the Jewish authorities for punishment. From 745 to 755 Abu Isa exercised a great influence as a reformer, abolishing the law of divorce and the sacrificial cult and maintaining himself with a large army against Merwan II and Abdallah. After his death he had followers into the tenth century. Yudghan, of Hamadan, on the other hand, pursued no political ends. He sought only to reform Judaism, being an ascetic and a believer in the transmigration of souls and the allegorical interpretation of the Bible. He died c.800 A.D., though his followers believed him to be still living and destined to return in the appointed time. In 1160 David Alrui, of Amadia, Persia, proclaimed himself to be the Messiah in Azerbaijan. His plan was to use the weakness of the Abbaside caliphate for the establishment of a free Jewish state, and he attracted to himself large masses of Jews; but he was murdered by his father-in-law before he could carry out his vast enterprise. A Messianic cult community, the Menahemites, cherished long his memory and ideal. Abraham ben Samuel Abulafia, of Saragossa, announced himself as the Messiah in 1280. He was a mystic and occupied himself much with cabalistic speculations. The expulsion of the Jews from Spain drove many earnest minds to the prophetic writings. Even such a statesman as Isaac Abarbanel wrote works in which he announced that 1503 would be the year of redemption. In the sixteenth century David Reubeni and Solomon Molko appeared in the rôle of the Messiah. The former pretended to be the brother of a prince reigning in Arabia and was received with great honor by Pope Clement VII. The latter, born in 1500, was a Christian who became a convert to Judaism and seems to have sincerely believed in his mission. He is said to have prophesied accurately the inundation of Rome in 1530 and the earthquake in Portugal in 1531, and thereby gained a great reputation. He was saved from death in Rome by Clement VII substituting another man for him, but suffered martyrdom courageously in 1532. His followers long believed that he had escaped death this time also. The most important Messiah after Solomon Molko was Sabbathai Zewi (1626-76). He was born in Smyrna and belonged to a family of Spanish Jews. His brother was the agent in Smyrna of an English mercantile house, and through him Sabbathai became acquainted with the speculations of Christian Pietists who expected the second advent of Christ in 1666. He was an eager student of cabalistic works. His personality was very attractive, and in all lands Jews were drawn to him and ac-

cepted him as their heaven-sent leader. The enthusiasm was boundless, and the hope of a return to Palestine filled thousands of hearts. Sabbathai intended to abrogate the law, establish a new code based on the Cabbala, introduce the doctrine of a Trinity consisting of three persons—the Ancient of Days, the Messiah, and the female Shechinah. In the year 1666, however, he was ordered to appear before the Turkish authorities at Constantinople. Here he finally abandoned the Jewish faith and became a Moslem. The disenchantment was great, but a sect of Sabbathians continued to honor him as the Messiah. It is obvious that the Messiahs of Judaism have sometimes been mystics, obeying what seemed to them a divine call, sometimes political leaders taking up a heroic struggle for liberty, sometimes men of personal ambition and unscrupulous methods. But Jews, Christians, and Mohammedans owe much moral vigor and spiritual uplift to the Messianic hope.

MESSIAH, THE. 1. A poem by Alexander Pope, which appeared in the *Spectator*, May 14, 1712. It is a sacred eclogue, imitating Vergil's *Pollio*. 2. An epic poem by Klopstock (q.v.). 3. An oratorio by Handel, composed in 1741 and given first in Dublin, April 13, 1742, in aid of charity, and in the United States (for the first time in its entirety) Dec. 25, 1818 (Boston).

MESSIDOR, mēs'sé'dôr' (Fr., from Lat., mes-

sis, harvest + Gk. δῶρον, *dōron*, gift). The tenth month of the French Revolutionary Calendar, beginning on June 19 in years 1 to 7, and on June 20 in years 8 to 13.

MESSINA, mēs-sē'nà (anciently *Messana*). The capital of the Province of Messina, Sicily. It is in the northeast corner of the island, on the Strait of Messina, 59 miles by rail northeast of Catania (Map: Italy, E 5). It is situated between a sickle-shaped harbor on the east and a chain of abrupt conical peaks on the west, rising to a height of 3700 feet. The climate is very even. The mean temperature is 66° F. The city suffered practically complete destruction on Dec. 28, 1908, by an earthquake, which, measured by destruction of life and property, was the severest ever recorded. Prior to that time Messina was, after Palermo, the most important city of Sicily. Messina was substantially built and had some fine lava-paved thoroughfares, affording views of the bay and of Calabria across the strait. The city itself had no very famous attractions for sightseers, having retained few of its striking antiquities, owing to a rather calamitous career; for prior to 1908, notably in 1783, it had suffered especially from earthquakes. The most interesting structure was the cathedral, dating from Norman times, having been begun in 1098 and finished by Roger II. It was a mixture of different architectural periods, and little of the original edifice remained to the building destroyed in 1908.

Among the leading secular edifices were the municipal palace, completed in 1829, and the villa Rocca Guelfonia, with Norman remains. The museum in the convent of San Gregorio contained a few paintings, some marbles and other antiquities, and a collection of majolica vases. The manufacturing interests were not extensive. The chief products were hardware, silk, muslin, and linen, and Messina had some fame for satins and damasks. The commerce was large and was facilitated by the excellent harbor, to which the importance of the city was chiefly due. Since the earthquake of 1908 the city has been reoccupied, and its rebuilding is in progress. The harbor is still busy with traffic in silk, oil, wine, oranges, lemons, fruit essences, coral, etc. Messina ranked seventh in 1911 among Italian ports in respect of the total tonnage entered and cleared (5402 vessels, of 4,166,367 tons net). There is direct steamship communication with Naples and Marseilles. The university, opened in 1538, had an enrollment of 574 students in 1907-08 and 238 in 1911-12. Messina is the seat of an archbishop. Pop. (commune), 1881, 126,497; 1901, 149,778; 1905, 158,812; 1911, 126,557.

The outskirts and environs are delightful, affording magnificent views of the sea as well as of Mount Etna. On the west rises the former fort of Castellaccio, and not far away to the south is Fort Gonzaga, on an historic spot. The new Campo Santo, before the earthquake, was beautiful, with its graceful Greek colonnades and wonderful views. The Telegrafo—the summit of a pass near Messina—is much visited for its scenery. Here was supposed to be the Charybdis of the familiar legend, opposite Scylla, on the Calabrian coast.

History. Messina is a town of great antiquity, its foundation being ascribed to pirates from Cumæ in the eighth century B.C., when it was known as Zancle (a sickle), in allusion to the shape of its harbor. At the end of the fifth

century B.C. the town was occupied by fugitives from Samos and Miletus, and it soon after passed to Anaxilas, the tyrant of Rhegium, who introduced there Messenians from the Peloponnesus, by whom the name of the city was changed to Messana. After the death of Anaxilas, Messana became a republic and maintained that status until its destruction by the Carthaginians during their wars with Dionysius of Syracuse at the beginning of the fourth century B.C. It was rebuilt by Dionysius, but soon fell again into the hands of the Carthaginians, who were finally expelled by Timoleon in 343 B.C. During the war between Agathocles (q.v.) of Syracuse and Carthage, Messana sided with the Carthaginians. After the death of Agathocles the town passed into the hands of the Mamertines (q.v.), whose appeal to Rome brought on the First Punic War. This war left Messana in the possession of Rome, and the town subsequently attained considerable commercial importance. It later gained Roman citizenship, perhaps from Julius Caesar; Augustus established a colony there. In 831 A.D. the town was taken by the Saracens, and in 1061 was conquered by the Normans. In 1194 it became a part of the dominions of Henry VI (q.v.) of the German Empire, and had the same history as Sicily (q.v.) until 1282, when it passed to the Spaniard Peter I. Except for a few years it remained under Spanish rule till 1713. The town became a flourishing seat of trade in the Middle Ages and later received important privileges from Charles I of Spain, which added greatly to its prosperity. During the struggle between the aristocratic faction, or Merli, and the democratic faction, or Mavizzi (c.1672-78), the Senate appealed for aid to the French, who occupied the city, but soon abandoned it, after having defeated the combined fleet of Spain and Holland. Left in the hands of the Spaniards, the city was deprived of its political liberties, and soon lost its commercial importance. The plague of 1743 and the earthquake of 1783 carried off a considerable part of its population. On Dec. 28, 1908, the city was demolished by an earthquake, and about 96,000 persons were killed.

MESSINA, ANTONELLO DA. See **ANTONELLO DA MESSINA**.

MESSINA, STRAIT OF (It. *Faro di Messina*, Lat. *Mamertinum Fretum*). The channel separating Sicily from the southern point of Italy and connecting the Ionian with the Tyrrhenian Sea (Map: Italy, E 5). It is 24 miles in length and from 2 to 12 miles in breadth. Regular tidal currents run through the strait, which is of great depth, in some places exceeding 4000 feet. See **SCYLLA** and **CHARYBDIS**.

MESS/MATES, ANIMAL. See **COMMENSALISM**.

MESS/MER, SEBASTIAN GEBHARD (1847-). An American Roman Catholic archbishop, born at Goldach, Switzerland. He was educated in St. George College at St. Gall, Switzerland (1861-66), and at the University of Innsbruck in Austria (1866-71). Ordained a priest in 1871, he was thenceforth until 1889 professor of theology at Seton Hall College, South Orange, N. J., and in 1890-92 was professor of canon law at the Catholic University of America, Washington, D. C. He was consecrated Bishop of Green Bay (Wis.) in 1892 and was appointed Archbishop of Milwaukee (Wis.) in 1903. He edited Devivier's *Christian Apologetics* (1903) and Bishop England's *Works* (7 vols., 1908) and is author of *Praxis Synodalis*

(1883); *Canonical Procedure* (1886); *Spirago's Method* (1901); *Outlines of Bible Knowledge* (1910).

MESSUAGE, mēs'wāj (OF. *masage*, a tenement, from *mas*, a house, manse). A legal term employed in conveyancing as substantially equivalent to the phrase "dwelling house and appurtenances," and most commonly construed as meaning the curtilage, courtyard, orchard, if there is one, etc. See **APPURTENANCE**; **CURTILAGE**.

MESSYS, or METSYS, QUINTEN. See **MATSYS, QUINTEN**.

MESTCHERSKY, mēst-shēr'ské, PRINCE VLADIMIR PETROVITCH (1845-1914). A Russian writer and editor. He became an intimate friend of both Alexander III and Nicholas II. In 1878 he founded and thereafter edited the *Grashdanin*, considered by some the most reactionary paper in Russia. He published some 12 novels, in which he portrayed the social conditions in St. Petersburg in a realistic and often coarse manner. His books include: *Women of St. Petersburg*, *The Nihilists*, and *Men of the Great World*. Mestchersky was sentenced to one week in prison in 1914 for publishing information regarding a mutiny in the Russian navy. Russians nicknamed him "the Knower" because of his intimate knowledge of court and cabinet matters. Throughout his life he fought strenuously every reform and progressive movement.

MESTIZO, mēs-tě'zō (Sp., mongrel, from Lat. *mixtus*, p.p. of *miscere*, to mix). The ordinary term in use in Spanish-American countries to denote the offspring of white and Indian parentage, and usually understood to mean the offspring of a white father by an Indian mother. The equivalent term in French Canada is *metis* and in the United States half-breed. The offspring of an Indian and a *mestizo* is called *mestizo-claro*, of a negro and *mestizo* a *mulato-oscuro*, of a mulatto and *mestizo* a *chino*.

MES'TOME (from Gk. μέστωμα, *mestōma*, fullness, from μέσος, *mestos*, full). In botany the conducting portion (hadrome and leptome) of a vascular bundle, which means the tracheary vessels of the xylem and the sieve vessels of the phloem.

MESTRE, mēs'trā. A town in the Province of Venice, north Italy, 5 miles by rail northwest of the city of Venice, on the border of a lagoon (Map: Italy, D 2). The town has a sixteenth-century palace and a fourteenth-century clock tower. There is a considerable transit trade; also manufactures of machinery, silk goods, and bricks. Pop. (commune), 1901, 11,680; 1911, 17,306, including Malghera.

MESTU'RUS (Neo-Lat., from Gk. μέστος, *mestos*, full + οὐρά, *oura*, tail). A fossil actinopterygian fish of the family Pycnodontidae, found in the Jurassic rocks of Europe. The body was flat and high and was covered with rhombic ganoid scales that are most peculiar in being united to each other by jagged sutures. The mouth is small and provided with powerful grinding teeth on the palate and sharp cutting teeth in the jaws. See **GANOIDEI**.

MESVINIAN. See **PALEOLITHIC PERIOD**.

MÉSÁROS, mā'sā-rōsh, LÁZÁR (1796-1858). A Hungarian patriot. He was born at Baja, studied theology and law, and in 1813 joined the Hungarian army in the campaign against Napoleon. He was colonel of a Hussar regiment in 1848, when Batthyányi called him to be Minister of War in his cabinet. In the same

year Mészáros took command of an expedition against the Rascians in his native county of Bács. This proved a complete failure, and in January, 1849, his army was defeated with great loss before Kaschau. For a brief time he was nominally commander in chief of the Hungarian forces and shared with Dembinski in the defeats at Szőreg and Temesvár. He then fled to Turkey. After residing for some years in England and France, Mészáros emigrated to the United States. He died at Eywood, Herefordshire, England, on his way to Switzerland.

META, mā'tā. One of the principal tributaries of the Orinoco. It rises in the Eastern Cordillera of the Colombian Andes, near Bogotá, and flows in a northeasterly direction to its junction with the Orinoco, on the boundary between Colombia and Venezuela (Map: Colombia, C 2). Its length is about 700 miles, for the greater part of which it is navigable for small steamers, though its channel is filled with numerous islands.

METABETCHOUAN, mēt'ā-bēt-chōō-än'. The principal southern affluent of St. John Lake (q.v.), Canada (Map: Quebec, G 2). It is 90 miles long and near its mouth occur its fine falls, 236 feet high.

METABOLISM (from Gk. μεταβολή, *metabolē*, change, from μεταβάλλειν, *metaballein*, to change, from μετά, *meta*, beyond + βάλλειν, *ballein*, to throw). The total changes occurring within the plant or animal body in foods, inorganic nutrients, and even living substance during the life of the organism. The construction of more complex materials from simpler ones is spoken of as anabolism, and the breaking down of the complex substances to simpler ones as katabolism. It was once thought that the metabolic activity of an organism consisted mainly or exclusively in building complex labile living substance, followed by the decomposition of this substance. This conception really led to the use of the terms "anabolism" and "katabolism." It seems evident now that many synthetic and analytic processes occur in the organism without the protoplasm at the same time passing through corresponding changes. The function of the protoplasm in many of these changes is apparently that of the production and control of enzymes involved in the processes. There is much evidence for the extreme lability of living matter and of some of the compounds entering into it, so that it is not unlikely that synthetic and analytic changes are occurring in it also with various changes of conditions.

In plant physiology the term "metabolism" is used in essentially the same sense as in animal physiology. The first step in the anabolism of green plants is photosynthesis. The carbohydrates first formed are probably hexoses. These are in part condensed directly or by the intermediate formation of pentoses into the storage or frame-building carbohydrates—starch, inulins, cellulose, hemicellulose, and wood structures. The rest of the carbohydrates form the carbon source for the construction of a great variety of organic compounds of the cells, the more important of which are fats, lipoids, amino acids, amines and alkaloids, glucosides, and proteins. In the synthesis of fats the sugar is first transformed to glycerine and fatty acids, and these condensed into the fats. Lecithin is a lipid always present in the living cell. It is really a fat in which one molecule of fatty acid is substituted by phosphoric acid bearing a

nitrogen-containing radical, cholin. The synthesis of lecithin is a very complex process and seems to run parallel with that of amino acids. Amines and alkaloids, both nitrogen-containing compounds, seem to have their origin in amino acids. The proteins are synthesized by two general steps. The various amino acids entering into the proteins are first formed. These are then condensed into proteins. Several of these compounds bear nitrogen, phosphorus, or sulphur in addition to the elements found in carbohydrates. These elements are derived from the salts of nitric, phosphoric, and sulphuric acids. The step of perhaps greatest interest in anabolism or assimilation is the formation of protoplasm itself from various of these substances. Of this we know nothing except that living protoplasm always contains proteins, fats, lipoids, and carbohydrates, the first in very high percentage. Just how these substances are united or arranged to constitute living matter we do not know, for the act of analysis itself leads to their separation and rearrangement. In the formation of nonliving structures like cell walls and starch grains enzymes such as cytochrome and amylase seem to play a main rôle. It is possible that in the synthesis of protoplasm itself such condensing enzymes are active; if so, their great lability prevents their isolation and study.

There are autotrophs that synthesize their organic materials from carbon dioxide and water by means of chemical energy (chemosynthesis in contrast to photosynthesis), or energy gained from oxidizing simple substances like hydrogen sulphide, ammonia, hydrogen, methane, and carbon monoxide. We know almost nothing of the details of their assimilative processes, but they are likely similar in general outline to assimilation in green plants.

In heterotrophs either the carbon source or both the carbon and nitrogen sources must be organic substances such as sugar, alcohol, organic acids, amino acids, peptones, or even in some cases proteins. While the anabolic processes are in general reduction or endothermic processes, the katabolic changes involve in large part oxidation or exothermic changes. It must be mentioned, however, that purely condensative and digestive processes (condensation of glucose to starch, or amino acids to proteins, or the reverse digestions) are almost nil in energy consumption and production. The main katabolic processes of the plant are digestion, respiration, and fermentation, which are fully treated under these terms.

Metabolism, in Medicine. In medicine under metabolism are understood the process of, and the chemical and tissue changes produced in, the human body by the assimilation of food. Metabolism considers therefore not only the action of the living cell upon a substance and the change produced in the substance as well as in the cell, but also the change in the tissue of the body to which the cell belongs, i.e., the nutrition of the body. There are two kinds of metabolism: (1) *anabolism*, the constructive and assimilative changes by which matter becomes protoplasm (a substance of the lower order changed into one of the higher); (2) *katabolism*, the destructive or retrograde change by which protoplasm becomes finally waste product (a substance of the higher order changed into one of the lower).

MET'ACEN'TRE (from Gk. *μετά*, *meta*, after + *κέντρον*, *kentron*, centre). It is shown in hydrostatics that a floating body is acted on by two equal forces in opposite directions—one vertically down through the centre of gravity of the body itself, the other vertically up through the centre of gravity of the volume which was occupied by the liquid now displaced by the body. If the body is at rest these two forces must lie in the same vertical line; but the question of the stability of this equilibrium depends upon what happens when the floating body is tipped slightly. If the forces bring it back to its former position the equilibrium is stable; if they make it tip still farther the equilibrium is unstable. Imagine a line drawn in the floating body so as to pass through the centres of gravity of the body and of the displaced liquid when the body is in equilibrium; this line is called the axis. Now imagine the body tipped slightly, thus making the axis inclined to the vertical; the line of action of the vertical upward force will intersect this line at a point called the metacentre. If the metacentre lies above the centre of gravity of the body the two forces will form a couple tending to restore the body to its former position, where the equilibrium was stable. If, on the other hand, the metacentre is below the centre of gravity of the body the forces form a couple tending to tip the body farther, and so the equilibrium was unstable. An elongated floating body like a ship has a *transverse* metacentre and a *longitudinal* metacentre. The former is the one most commonly considered. The metacentric height is the vertical distance between the centre of gravity and the metacentre. It is evident that this must always be a positive quantity; for if the centre of gravity were above the metacentre there would be no force tending to keep the vessel upright and it would capsize. See SHIPBUILDING.

MET'ACHRO'SIS (from Gk. *μεταχρῶνναι*, *metachrōnnynai*, to change color, from *μετά*, *meta*, after + *χρῶνναι*, *chrōnnynai*, *χρῶν*, *chrōzein*, to color, from *χρῶσις*, *chrōsis*, color,

in the size of the pigment cells of the inner layer of the skin. These specialized pigment cells are called chromatophores, and the remarkable changes in the color of the skin of the chameleon, of the tree toad, the squid, etc., depend on the distribution of these pigment cells, which dilate (becoming highly ramified) and contract under certain kinds of irritation. The pigment (q.v.) varies in color in different species and in different parts of the body, being black, brown, yellow, and sometimes even red or green. In the goby Heincke found that the chromatophores which are yellow or greenish yellow when distended become orange colored when contracted, while the orange or red ones when shrunk become brown or even black; and he detected in the goby a special kind of chromatophores which were filled with iridescent crystals of marvelous delicacy, appearing when dilated as specks of metallic sheen.

These changes may be due to the direct influence of the stimulus of light, or indirectly through the eyesight. Semper says that Lister demonstrated as long ago as 1858 that the activity of the chromatophores depends solely on the healthy condition of the eye. As soon as the eyes are destroyed or the optic nerve is divided the chromatophores do not function. He was confirmed in this view by Pouchet's experiments on fishes and crabs, showing that the chromatophores lost their power of contraction if the two sympathetic nerves were destroyed at the root.

Heincke's observations in some respects contradict those of Pouchet. Biedemann (1892), on the other hand, has claimed that the color cells change their shape owing to the direct action of the light and of temperature. He shows that the slightest change of temperature affects the mutual disposition of the pigment cells, and consequently the color, of the frog. It is enough to keep the animal in the hand to provoke a contraction of its black cells. The amount of blood supply also has a definite effect. Steinach also (1891) has proved that light acts as a direct stimulus. Biedemann therefore appears to have proved that the chief agency of changes of color is not in the sensations derived from the eyes, but in those derived from the skin. On the other hand, recent interesting experiments by Sumner seem to show that the color changes adapting the pattern of flounders to artificially patterned bottoms are due to stimuli received solely through the eyes.

It is well known that the underside of flatfish is white or colorless. This is due to absence there of pigment cells. These, however, are present in very young flounders, but as they grow unsymmetrical the fish turns the left side upward, and the chromatophores disappear from the right or under side. Cunningham experimented with young flounders by placing a mirror below the aquarium at an angle of 45° and cut off the light from above. In the larger number of specimens thus treated, after several months, more or less of the skin of the lower side was pigmented. He thus proved that the absence of

SECTION OF A FROG'S SKIN.

a, epidermis; b, cutis, with black, star-shaped, deep-seated cells; c, d, yellow pigment cells in a thick, single layer close under the epidermis.

CHROMATOPHORES OF A FROG.

a, wholly contracted; b, c, half relaxed; d, wholly relaxed; e, wholly contracted (a capillary vessel); f, g, h, expanded color cells.

from *χρῶν*, *chroia*, *χρῶν*, *chroa*, skin, color). Color change, as that of the chameleon, in adaptation to surroundings, due to changes

pigment on that side in the normal fish is due to its position in shadow. It thus appears that the absence of the pigment or of color is due to the absence of light—a mechanical or physical cause.

MET'AGENESIS. See ALTERNATION OF GENERATIONS; PARTHENOGENESIS.

MET'AKINE/SIS (Gk. *metakinesis*, transposition). A term in biology suggested by Jaekel to express the results of cenogenetic modification, since the process involves a thoroughgoing modification of a form in a way impossible in the adult and only possible in a larval or early stage, or in which the various organs are not yet specialized. Consult Jaekel, *Ueber verschiedene Wege phylogenetischer Entwicklung* (Jena, 1902; reviewed in *Science*, vol. xvii, New York, 1903). Compare PALINGENESIS.

METAL. See HERALDRY.

METAL, FUSIBLE. See FUSIBLE METAL.

METAL CASTING. See FOUNDED.

METAL'DEHYDE. See ALDEHYDE.

METAL LATH. See LATHS AND LATHWOOD.

METALLIC INK. See INK.

METALLIC PAINT. See PAINT, MINERAL.

MET'ALLOG'RAPHY. The study of the structure and constitution of metals and alloys and their relation to the physical properties. Sorby, who was the first to make rock sections, examined the structure of iron and steel for comparison with that of meteorites in 1863. Martens in 1878 took up the work. Osmond and Werth's "Structure cellulaire de l'acier fondu" (*Comptes Rendus*, vol. c, p. 450) and Wedding's paper on the microstructure of malleable iron appeared in 1885 (*Journal Iron and Steel Institute*, vol. i, p. 187). Since then metallography has grown until now it is a recognized method of testing and of research.

The Structure of Metals. The old idea of the structure of metals was based on an examination of fractures, and from this came the terms "crystalline," "granular," "fibrous," "amorphous," etc. The microscope has proved, however, that all metals are crystalline, that the appearance of the fracture may have no relation to the structure of the metal but depends not only on the method of breaking but also on the mechanical and thermal treatment the metal may have undergone. All metals which have cooled down from the liquid state are built up of crystalline grains with distinct orientation, the size and shape depending chiefly on the rate of solidification and the mass of the metal.

A section of a small ingot of pure zinc, after deeply etching with dilute nitric acid to bring out the grain structure, is shown on the accompanying plate. It shows the growth of crystals perpendicular to the cooling surface of the mold, also the central pipe or shrinkage cavity characteristic of most metals—for as most metals

freeze they contract. When the metal is poured into the mold heat flows from the hot metal to the cold mold and a point is reached when the metal next the mold is at its freezing point. Crystals start to grow in all directions, but are soon restricted from growing laterally by adjacent crystals, which leaves only one direction in which they can grow, viz., towards the still liquid mass of metal, which is opposite to the direction of flow of heat, so that they grow perpendicularly to the isothermal lines of the metal. This method of growth is clearly shown at the bottom corners of the ingot in Fig. 1.

In a thin casting these crystals perpendicular to the surface of the mold soon meet at the centre and the fracture of such a metal would be columnar. In thicker castings, however, the process of freezing is slower, the thermal gradient between the centre and the outside becomes less and less, and a point is reached when the still liquid metal begins to crystallize at a number of independent centres. These crystals grow in all directions until they meet adjacent crystals, and in this way the centre of the metal is composed of equidimensional grains. Thus we get a difference in structure between the outside and the centre of the ingot or casting, the outside being columnar, the interior granular.

The method of growth of crystals is well shown by the skeleton crystals found in the interior of the pipe or shrinkage cavity of large castings. This is illustrated on the plate Fig. 2, a specimen of lead obtained by taking a crucible of molten metal, chilling the surface, and, when a crust of solid metal had formed, pouring out the still liquid interior. The crystals grow with definite axes, which are well shown on the surface of small ingots of most metals. Fig. 3, magnified 30 diameters, is the surface of a small ingot of the metal cadmium. It shows several skeleton crystals or dendrites. These form the framework of the grains and are left standing out in strong relief because they were the first to freeze, and as they froze the metal contracted until the whole mass was solid. A section, however, would show the metal to be built up of

FIG. 15.

polygonal grains as in Figs. 5, 8, or 15. On deep etching each grain shows its own particular orientation, appearing light or dark according to the way it is cut, as seen in Fig. 1.

The structure of a metal shows no change when strained within the elastic limit, but when

once this is passed there is a permanent deformation. If a polished surface be examined after such straining, within the grains are seen a number of parallel lines and bands which change in direction as we pass from one grain to the next. As the strain increases these slip lines and slip bands increase in number and are found in more than one direction within each grain, and the grains themselves become elongated and drawn out as the strain becomes more severe. Figure 4, magnified 30 diameters, shows the slip bands produced in zinc. The orientation of the grains can be seen, while within the two largest grains the slip bands appear white and change in direction as we pass from one grain to the next. In some metals the grains appear capable of being elongated and drawn out indefinitely as, e.g., copper. Figure 5, magnified 200 diameters, shows the grain structure of pure copper. Figure 6, magnified 400 diameters, shows the structure of a cold-drawn copper rod, deeply etched, in which the grains are very much drawn out and show a crosshatched effect due to the slip lines. Some metals, like lead and tin, behave differently, for when the strain has been very severe, as in rolling, the grains are first distorted and then broken down and the structure becomes composed of a broken-up conglomerate. When a metal is strained by cold work, as in rolling or drawing, the elastic limit and tensile strength are greatly increased and the metal becomes much harder, but as a rule the ductility falls off proportionately.

On annealing such a strained metal recrystallization takes place and crystals or grains grow with distinct polygonal boundaries and generally show marked twinning (Fig. 16), the grain size

Fig. 16.

depending on the time and temperature of annealing, the amount of work the metal has undergone, and upon its cross section or mass. The strength falls off and the metal becomes comparatively soft and its ductility increases. Figure 7, magnified 400 diameters, shows the structure of a cold-drawn copper tube after annealing at a dull red heat. The original structure was the same as seen in Fig. 6. The deep etching reveals the twin structure more prominently than the grain structure. Both the twinning and the grain structure can be developed by annealing in hydrogen. Figure 8, magnified 400 diameters, shows this same cold-drawn copper, polished and then reheated to

1000° C. in an atmosphere of hydrogen. The polygonal grain boundaries show up distinctly, while the alternate light and dark bands show the twinning. The whole structure is in marked contrast with that of Fig. 6.

The recent researches of Beilby and others tend to confirm his theory that cold working of a metal produces an amorphous modification due to flow on the surfaces of the planes of slip, which modification is harder, stronger, and less ductile than the crystalline one. Reheating to temperatures around 300° C. causes the transformation from the amorphous to the crystalline state and restores the ductility.

The Constitution of Alloys. The constitution of binary alloys is shown by the thermal diagram, which in terms of temperature and composition shows the changes which occur when an alloy freezes and as it cools down in the solid state. Portevin and Bornemann have collected those so far published, while Guertler's textbook discusses them exhaustively. Under the microscope three distinct constituents—pure metals, chemical compounds, and solid solutions—are found. A chemical compound is one in which we get a complete merging of the constituent metals in definite atomic proportions, while in a solid solution we have a complete merging but in indefinite proportions.

Now, alloys are solutions and can be classified according to solubility. We have two main divisions as follows:

A. No compounds are formed.

Solubility in liquid state	Solubility in solid state
1. Complete	{ a. Complete b. Limited c. Zero
2. Limited	{ b. Limited c. Zero
3. Zero	{ c. Zero

B. Compounds are formed.

1. The compound occurs at a maximum on the freezing-point curve.
2. The compound forms by reaction between one of the metals and the liquid from which it has crystallized. In heating it dissociates before reaching its melting point.

We can further subdivide group B according to the solubility of the compounds in each of the metals, as under group A.

The Thermal Diagram. To construct the thermal diagram we use temperature time or cooling curves of individual alloys. Type cooling curves are shown in Fig. 17. They indicate the changes in the rate of cooling as the alloy changes from the liquid into the solid state. The first curve is that of a pure metal. Cooling down in the liquid condition is shown from *a* to *b*. The horizontal *bc* shows the arrest in cooling due to the latent heat of fusion as the metal freezes. At *c* the metal is completely frozen, while from *c* to *d* we have regular cooling in the solid state. The rest of the curves are those showing the freezing of type alloys.

Having obtained cooling curves of a suitable number of alloys of a pair of metals, and plotting the breaks of these curves on a temperature-composition diagram, curves can be drawn to indicate the beginning of freezing or the liquidus and the end of freezing or the beginning of melting, the solidus. Above the liquidus the alloy is completely liquid, and below the solidus all is solid, while between these two curves we

have a mixture of liquid and solid. The changes in composition of the liquid and solid are also given by these two curves. The composition of a liquid at any particular temperature is given by the liquidus, while the composition of the

of freezing is shown by the solidus $AmyB$. Each alloy of this series has a cooling curve similar to Diagram II, Fig. 17. The alloy begins to freeze at x and is completely solid at y . For example, take the alloy xy , shown in Diagram I,

FIG. 17. TYPE COOLING CURVES.

Campbell, *Proceedings of the American Society for Testing Materials*, xiii, 1913.

solid freezing out at that temperature is shown by the solidus.

Following the classification given above, the first type of thermal diagram is as follows:

Case A 1 (a). Completely soluble in both the liquid and solid states. This is shown in Diagram I, Fig. 18, in which the temperature is indicated in the vertical scale and percentage composition in the horizontal. The point A is

Fig. 18. It begins to solidify at the point x . The solid which begins to freeze out is not pure A, but a solid solution whose composition is given by the solidus at this temperature or m . Now, as the alloy freezes the composition of the solid solution freezing out changes from m to y and the composition of the liquid changes from x to n . The solid alloy consists of homogeneous grains of a solid solution of the metals A and B.

FIG. 18. TYPE THERMAL DIAGRAMS OF BINARY ALLOYS.

the freezing point of the pure metal A, while B is that of the pure metal B. Then the beginning of freezing of any alloy of A and B is shown by the curve $AxnB$, which is the liquidus. The end

So it is that all the alloys of A and B, when solid, consist of solid solutions of A and B, or alpha, which form a continuous series from pure A and pure B and vary uniformly in physical

properties. Their structure can be represented by Fig. 15. When strained beyond the elastic limit slip lines appear as in a pure metal. Cold work elongates the grains as in Fig. 6, while annealing such cold-worked material causes a recrystallization, as in Figs. 7 and 8, diagrammatically shown in Fig. 16, with more or less marked twinning. As examples of this type we have *Cu-Ni*, *Au-Ag*, *Au-Pt*, *Cu-Pt*, *Fe-Mn*, *Fe-Co*, *Ni-Co*.

Case A 1 (c). The two metals are completely soluble in all proportions when liquid but insoluble when solid. The diagram is II, Fig. 18. The addition of A to B lowers the freezing point, while the addition of B to A also lowers the freezing point, and two curves are produced which intersect at the point *C*. *ABC* is the liquidus, *dCe* the solidus. Any alloy from *d* to *C* begins to freeze on reaching the temperature *AC*,

Fig. 19.

by separating out crystals of the pure metal A. In the alloy represented by *xy*, A freezes out from *x* to *y*. At *y* the composition of the liquid has reached *C* and it then freezes as a mechanical mixture of A and B and forms the ground mass for the crystals of A. Similarly any alloy between *C* and *e* begins to freeze by the formation of crystals of B. The alloy of the composition *C* is that with the lowest freezing point, which by definition is called the eutectic. As the ground mass of all alloys of this type is composed of *C* it consists of a mechanical mixture of A and B. The structure of any alloy between *d* and *C* is represented by Fig. 19, where the white grains of A are surrounded by a matrix of eutectic. Curve III, Fig. 17, shows the cooling curve of such an alloy. Cooling down uniformly in the liquid state is shown by *ax*. At *x* the metal A begins to freeze out and freezes from *x* to *y*. From *y* to *c* the eutectic freezes and at *c* the alloy is completely solid. The cooling curve of the eutectic alloy *C* is shown in Curve IV, Fig. 17. The horizontal *bc* shows the freezing out of the eutectic at constant temperature. As examples of this type we have *Pb-Ag*, *Bi-Ag*, *Bi-Au*, *Pb-Sb*, *Cd-Bi*, *Cd-Zn*, *Sn-Zn*, *Hg-Zn*.

Case A 1 (b). The two metals are partially soluble in each other when in a solid state. A eutectic occurs. The diagram is III, Fig. 18. The liquidus is similar to that of the last diagram, but the solidus is given by *AdCeB*.

This is because the metal A will hold *d* per cent of B in solid solution, while the metal B will hold *e* per cent of A in solid solution and the eutectic only makes its appearance between *d* and *e*. Any alloy from pure A to *d* per cent of B is a solid solution of B in A, or alpha, while any alloy from pure B to *e* is a solid solution of A in B, or beta. This freezes in the same way as in Case A 1 (a). Alloys between these two limits consist of crystals of alpha or beta surrounded by the eutectic of composition *C*, which is a mechanical mixture of alpha and beta and not of A and B. The structure of any such alloy can be represented by Fig. 19. The method of freezing can be shown by following the alloy *xy* as in the last case. The alloy begins to freeze at *x* by separating out a solid of the composition *m*. As the temperature falls this solid changes from *m* to *d*, while the liquid changes from *x* to *C*. At *y* we have crystals of composition *d* surrounded by the liquid *C*, which is the eutectic. When completely frozen, therefore, the alloy consists of crystals of alpha surrounded by the eutectic. The curves *df* and *eg* show that the amount of B which A can hold in solid solution and the amount of A which B can hold in solid solution decrease with fall of temperature. In other words, the curves *df* and *eg* are the solubility curves of B in A and A in B in the solid state. As examples of these alloys we have *Cu-Ag*, *Bi-Sn*, *Bi-Pb*, *Sn-Pb*, *Sn-Al*, *Sn-Cd*, *Pb-Cd*, *Pb-Hg*, *Ni-Au*.

Case A 1 (b). The two metals are partially soluble in each other when solid. No eutectic occurs. The diagram is shown in IV, Fig. 18. Here the addition of B to A lowers the freezing point, but the addition of A to B raises it. The two curves forming the liquidus intersect at the point *L*. The solidus is shown by *AdeB*. As in the last case alloys from pure A to *d* and from pure B to *e* consist of solid solutions, alpha and beta. Between *d* and *e*, however, the alloys are composed of grains of alpha surrounded by beta, shown in Fig. 20, the alpha being white, the beta black. Taking the alloy *xy* as an example, freezing begins at *x* by the separation

Fig. 20.

of a solid solution as in the last case. At *y* we have crystals or grains of *d* in a liquid whose composition is *L*. Here a reaction occurs between the liquid *L* and the solid alpha of composition *d*, and a solid beta, of composition

e, is produced, forming a ground mass to the alpha grains. The cooling curve of such an alloy is given in III, Fig. 17, where *xy* indicates the freezing out of the alpha and *yc* the formation of beta by the reaction between this alpha and the liquid *L*. Alloys between *e* and *L* show no alpha when solid, because it is all used up through the reaction. This is illustrated by the alloy *uvw*, where solid alpha begins to freeze out on reaching *u* and continues to separate until the temperature *v* is reached. Here the reaction occurs between the alpha and the liquid *L*, and all of the alpha is used up. Then the temperature falls from *v* to *w*, and the composition of the solid beta changes from *e* to *w*, so that when frozen the alloy is composed entirely of beta. The cooling curve is shown in V, Fig. 17, where *uv* is the separation of alpha, the horizontal *vc* is the reaction, while the *cw* is the further separation of beta as the temperature falls. At *w* the whole mass is solid. As before, the lines *df* and *eg* are the solubility curves of B in A and A in B in a solid state. *Cd-Hg*, *Pt-Ag*, *Fe-Au*, *Cu-Co*, *Cu-Fe*, the brasses and bronzes (in part), are examples of this type.

Case B 1. A compound occurs. Its freezing point is a maximum on the liquidus. Take the simplest case where A and B form a compound, J, which is insoluble in either A or B in the solid state. The resulting diagram is shown in V, Fig. 18. This is really compounded of two simple curves of the type II, which represent the alloys of A and J and the alloys of B and J. At *C* we have the eutectic of A and J, at *F* we have the eutectic of B and J. The liquidus is *ACJFB* and the solidus is *dCegFh*, and freezing occurs as already described in Case A 1 (c), while the structures are similar to that of Fig. 19. As examples we have *Zn-Mg*, *Pb-Mg*, *Sn-Mg*, *Cu-Mg*, *Al-Mg*, *Al-Sb*, *Cd-Sb*, *Cu-P*, *Cu-As*, etc.

Case B 2. The compound forms by reaction between one of the solid metals and the liquid from which it crystallizes. Diagram VI, Fig. 18, shows this case. *ALCB* is the liquidus, *eCdJh* is the solidus. The point *C* is the eutectic of the compound J and B. When solid, alloys from B to *g* are composed of crystals of B in the eutectic. Alloys from *g* to *f* show the compound J surrounded by the eutectic, which is a mechanical mixture of J and B. Alloys from A to *f* are composed of grains of A in a ground mass of J. Taking the alloy *xy*, it freezes out pure A from *x* to *y*, and at this temperature the liquid has the composition *L*, and reacts with the solid A to form the compound J. When all of the liquid is used up the alloy consists of cores of A in a ground mass of the compound J. In Fig. 20 the white areas represent A, the black ground is J. The cooling curve of such an alloy can be represented by III, Fig. 17, *xy* representing the freezing out of A and *yc* the reaction which forms J. The alloy *uvw* begins to freeze out pure A. At *v* this pure A reacts with the liquid *L* and is all used up. As the temperature falls the liquid continues to freeze out more J and the composition of the liquid changes from *L* to *C*, as the temperature falls from *v* to *w*, when the eutectic freezes and the resulting alloy is composed of J surrounded by the eutectic of J and B. The cooling curve of this alloy is shown in VI, Fig. 17, where *uv* shows the freezing out of A, *vc* the reaction between the liquid *L* and the solid A to form J, whereby all of the A is used

up. *cw* shows the further freezing of the compound J, and *we* is the freezing of the eutectic of J and B. This type diagram can be modified by showing partial solubility of the metals in the compound. The freezing will take place as already described, except that instead of pure A we would have alpha, etc. As examples of this type we have *Ag-Sn*, *Ag-Sb*, *Au-Sb*, *Au-Pb*, *Fe-Zn*, *Al-Zn*, *Al-Ni*, *Al-Co*, *Mn-Sn*, *Pt-Pb*.

The last case is where J and B do not form a eutectic and is shown in Diagram VII, Fig. 18. Alloys from pure A to *h* freeze as in the last case. Alloys from *h* to B resemble those in Diagram IV. For example the alloy *uvw* begins to freeze with the separation of pure A. At *v* this A reacts with the liquid *L* to form the compound J. As the temperature falls from *v* to *w* more J freezes out and the liquid changes from *L* to *K*. At *w* we get the reaction between J and the liquid *K* to form beta of the composition *e*, so that when solid the alloy consists of J surrounded by beta, as in Fig. 20. The cooling curve of such an alloy is given in VI, Fig. 17, where *uv* shows the separation of pure A, *vc* the reaction to form the compound J, *cw* the continued freezing out of J, while *we* is the reaction between the liquid *K* and the compound J to form beta. Tin and antimony are alloys of this type, the compound of *Sb-Sn* being formed.

TERNARY ALLOYS

If we wish to show variation in composition of three metals we have to use the triaxial diagram. In Fig. 21 the corners of the equi-

FIG. 21.

lateral triangle represent the pure metals A, B, and C. The composition of any alloy within the triangle is given by the perpendicular distances to the sides. For example, in the alloy *g* the per cent of A is represented by the perpendicular from *g* to *BC*, the per cent of B is represented by the perpendicular from *g* to *AC*, while the per cent of C is represented by the perpendicular from *g* to *AB*. The binary alloys of A and B are represented by the line *AB*. The binary alloys of B and C and A and C are represented by the sides *BC* and *AC* respectively, and these three sides are projections of such binary diagrams as are shown in Fig. 18. Temperature must be indicated perpendicular to the plane of the triangle and a solid figure results. Only one case will be shown, that in which the pairs of metals are completely soluble in the liquid state and insoluble in the solid. Each pair therefore can be represented by Curve II, Fig. 18. In Fig. 21 the side *AB* being a projection of Fig. 18, II, the point *f* is the projection of the eutectic *C*. Now if we use arrows to indicate fall of temperature we should show a

fall of temperature from *A* to *f* and from *B* to *f*, representing the curves *AC* and *BC* in Diagram II, Fig. 18. In the same way *d* and *e* represent the binary eutectics of *AC* and *BC*, the ternary eutectic being the alloy with the lowest freezing point, represented by point *g*, as shown by curves from the points *d*, *e*, and *f*, and this divides the triangle into three areas. The metal *A* freezes out of any alloy within the area *Adgf*, *B* freezes out in the area *Begf*, while *C* is the first to freeze within the area *Cdge*. The method of freezing of all the alloys is similar. Take the alloy *x*, which begins to freeze by separating out crystals of *C*, and the composition of the liquid changes from *x* to *y*, a projection through *C*. From *y* to *g* *A* and *C* freeze out side by side, forming, as it were, a binary matrix to the crystals of *C*. When the composition of the liquid reaches *g* the ternary eutectic freezes as a mechanical mixture of *A*, *B*, and *C*. Thus the line *dg* represents the binary *A* and *C*, the line *fg* the binary *A* and *B*, while the line *eg* shows the simultaneous freezing of *B* and *C*. The cooling curve of a ternary alloy is given in Fig. 17, VII, where *xy* denotes the freezing of the metal *C*, *yg* the simultaneous freezing of *C* and *A*, while *ge* is the arrest denoting the freezing of the ternary eutectic of *A*, *B*, and *C*. As examples of this type we have the series *lead-tin-bismuth*, which was worked out by Charpy, *lead-tin-cadmium* and *bismuth-tin-cadmium*, given by Stoeffel. By taking pairs of metals shown in the different diagrams of Fig. 15 the ternary diagram is greatly modified, and examples of this have been worked out by Geer, by Sahmen and Vegesack, and by Campbell.

Partial Solubility in the Liquid State. In the cases we have discussed so far the solubility in the liquid state was complete, for when the component metals were melted together a homogeneous liquid resulted. Certain pairs of metals, however, have only a limited solubility in the liquid state, and, when melted together within certain limits, separate out into two liquid layers. Each liquid is saturated with the other metal, but as the temperature is raised the amount which each metal can dissolve of the other increases so that at a certain temperature (the critical temperature) each liquid has the same composition and one homogeneous liquid results. Now by determining the variation in composition of each layer with variation in temperature we can construct a pair of solubility curves which show the amount of *A* dissolved in *B* and the amount of *B* in *A* for each particular temperature. These two curves meet at the critical temperature, and we get the completed solubility curve.

Now according to the way in which this solubility curve cuts the freezing point curves shown in Fig. 18, so will the constitution of the alloys vary, and any alloy whose composition lies within the points where the solubility curves cut the liquids will be found when solid to consist of two layers.

As examples we have *lead-zinc*, *bismuth-zinc*, *copper-lead*, *chromium-copper*, *chromium-silver*, *chromium-aluminium*, *chromium-tin*, *chromium-lead*, *manganese-lead*, *cobalt-lead*, *nickel-lead*, also *copper* and *copper oxide*, *copper* and *copper sulphide*, *iron* and *iron sulphide*.

In the case where the two metals are insoluble in each other at the beginning of freezing we have two liquid layers, each consisting of the pure metal. Each layer freezes at its own

particular temperature, that of the freezing point of the pure metal. As examples we have *aluminium-cadmium*, *aluminium-lead*, *iron-lead*, *iron-silver*, *cobalt-silver*.

Changes in the Solid State. So far the changes which an alloy undergoes when it changes from the state of a liquid solution to a solid have been considered. Solid solutions may undergo very similar changes as they cool down, which changes may be represented by diagrams similar to those in Fig. 18. For example, in Fig. 18, Curve II, suppose the alloys above *ACB* exist as homogeneous solid solutions. The same explanation of the diagram holds good except that the pure metals are precipitated from the solid instead of freezing out of the liquid as before. Thus, the alloy *xy* on reaching *x* begins to precipitate pure *A* from each grain of the solid solution and this continues down to the temperature *y*, when the residual grain has the composition *C*. Here it splits up into a mechanical mixture of *A* and *B* very similar to a eutectic. The alloy *C* is not the alloy with the lowest freezing point, but the one with the lowest transformation point, hence we call it the eutectoid.

Such changes in solid solutions are found in brass and in bronze, where the beta solid solution breaks down into a mechanical mixture of alpha and the compound *Cu₃Sn* at about 500° C. For example, a bell metal of 20 per cent tin and 80 per cent copper if quenched from just above 500° C. would have the appearance of Fig. 20. If slowly cooled, however, this structure of alpha surrounded by beta would change at 500° C., because the beta breaks down into a mechanical mixture of alpha and *Cu₃Sn* at this temperature and its structure would then resemble Fig. 19. Each grain of alpha contains about 12 per cent of tin in solid solution, while the groundmass or eutectoid contains about 26½ per cent of tin, partly as alpha, partly as the compound *Cu₃Sn* (with 32 per cent tin).

In the aluminium bronzes a similar eutectoid occurs. The alpha is saturated with aluminium at 7½ per cent. The eutectoid contains 12 per cent aluminium; thus alloys between 7½ and 12 per cent resemble Fig. 19. The eutectoid transformation occurs at 550° C. The most important eutectoid change, however, occurs in the iron-carbon series, and to this change steel owes most of its well-known properties.

The Iron-Carbon Diagram. We now recognize that wrought iron, soft, medium, and hard steel, cast iron, both white and gray, belong to a continuous series of alloys and consist of the following constituents in varying proportions: *ferrite* or pure iron, soft and malleable; *cementite* or carbide of iron, *Fe₃C*, hard and brittle, 6.67 per cent carbon; *pearlite*, the eutectoid of ferrite and cementite, 0.9 per cent carbon. The above are found in steel, while in addition we find graphite in cast iron. Now, on heating, the eutectoid, pearlite, changes at about 700° C. from a mechanical mixture of ferrite and cementite into a solid solution called *austenite*, which, as the temperature is raised, is capable of dissolving more and more ferrite or cementite as the case may be. Austenite is a solid solution of carbon in iron, which is capable of hardening on quenching.

The occurrence and the temperature limits of the above constituents are shown in Fig. 22, which is the diagram for iron-iron carbide or cementite.

The freezing-point curve or liquidus is *ADL*, while the solidus is the curve *AEDF*, the end of freezing or, in heating, the beginning of melting. The alloy *DT* is the eutectic and consists of a mechanical mixture of austenite and cementite. On freezing, alloys from 0 to 2 per cent carbon consist of austenite and are steels, alloys with over 2 per cent of carbon are cast irons and consist of grains of austenite set in the eutectic (*DT*) if less than 4.2 per cent carbon, or of crystals of cementite surrounded by the eutectic if more than 4.2 per cent carbon.

An alloy between 2 and 4.2 per cent carbon can be well represented by Fig. 19, the grains being the excess austenite, the matrix the eutectic of austenite and cementite. The white cast iron in Fig. 14 shows the eutectic structure typically.

The diagram also shows the changes which

than 0.9 per cent carbon they are composed of cementite and pearlite.

The iron carbon diagram is not yet definitely settled and its development has been the source of much controversy on account of the difficulties encountered. Osmond determined the three forms of iron—alpha, which exists up to 780° C. and is magnetic; beta, which exists from 780° to 900° C. and is nonmagnetic; gamma, also nonmagnetic, exists above 900° C. and has the property of dissolving a maximum of 2 per cent of carbon. The first comprehensive temperature-composition diagram was given by Roberts-Austen (*Fourth Report to Alloys Research Committee*, plate ii, 1897. Institution of Mechanical Engineers, London; *Fifth Report*, 1899), and this consisted of the lines shown in Fig. 22, *ABC*: *aBf*, the graphite-austenite eutectic; *GOS*; *MO*; *PSK*; *SE* in part.

Fig. 22.

take place in the solid solution austenite. Iron exists in three modifications: above 900° C. it is in the gamma condition, is nonmagnetic, and can dissolve carbon up to about 2 per cent; below 900° C. it cannot dissolve carbon, being in the beta condition down to 780° C. and nonmagnetic (i.e., *G* to *M*); below 780° C. it is in the alpha or magnetic condition. Therefore austenite is a solid solution of carbon in gamma iron and at 1125° C. is saturated at about 2 per cent carbon. However, the amount of carbon in solution falls with the temperature and cementite precipitates, as shown by the curve *ES*, which is the solubility of cementite in gamma iron. Again, the curve *GOS* indicates the precipitation of ferrite from the solid solution austenite. *GO* yields beta ferrite, *OS* the magnetic or alpha variety. At 700° C., or temperature *PSK*, we have the formation of the eutectoid pearlite from austenite of 0.9 per cent carbon. From 0 to 0.9 per cent carbon steels consist of ferrite and pearlite, while with more

Rooseboom applied the phase rule to Roberts-Austen's work and modified the diagram by adding the line *Aa*, joining the point *a* by a line to the summit of the curve denoting separation of cementite at 1.8 per cent carbon and 1000° C. A horizontal line was drawn from this point, indicating a reaction between austenite and graphite to form cementite. Above 1000° C. we are dealing with austenite and graphite and *aBf* is the austenite-graphite eutectic. Below 1000° C. we have no graphite in a state of equilibrium, all the carbon occurring as cementite. (*Journal Iron and Steel Institute*, 1900, ii, p. 311.)

Stansfield in a paper on the "Present Position of the Solution Theory of Carburized Iron" (*Journal Iron and Steel Institute*, 1900, ii, 317) suggested a radical change. Instead of the line from *a* (denoting the further separation of graphite) cutting the cementite line *SE*, a line *an* is drawn to the left of and parallel to *ES* so as to cut *GOS*. This new line *an* shows the

solubility of graphite in austenite, which is much less than that of cementite in austenite. In other words, if cooled slow enough the 2 per cent of carbon which iron holds in solid solution ought to be rejected as graphite and not as cementite. According to the phase rule only two constituents can be present in equilibrium, and as graphite is the more stable, these two constituents must be ferrite and graphite.

Benedicks sums up the previous work and shows (*Metallurgie*, 1908, part ii) that we are dealing with two distinct and separate systems:

1. *White cast iron. Metastable.* Alloys of *austenite* and *cementite*. Produced by rapid cooling, low silicon, high manganese, etc. The solidus is shown in Fig. 16 by the curved line *AEDF*, the eutectic freezing at about 1125° C.

2. *Gray cast iron. Stable.* Alloys of *austenite* and *graphite*. Produced by slow cooling, high silicon, low manganese, low sulphur, etc., and more liable to occur in iron of high carbon content. The liquidus is *ABC*, the solidus *AaBf*, and the eutectic freezes at 1135° C. Mottled cast iron consists of grains of gray surrounded by a network of white. The gray appears to have solidified a little ahead of the white, giving us a grained structure, diagrammatically shown in Fig. 19. Thus we have two systems, graphite-austenite or cementite-austenite, on freezing. The austenite, however, is not stable, but changes over with fall of temperature. This it can do by separating out cementite along the curve *ES* or graphite along the curve *an*.

Goerens and Gutowsky concluded from their experiments that graphite is always the product of the decomposition of cementite, for cast iron freezes as austenite-cementite, but just below the freezing point may be changed over into austenite-graphite wholly or in part. (*Metallurgie*, vol. v, p. 45.)

Upton holds that white cast iron is the product of undercooling, and that Roseboom was correct in stating that the stable constituents on freezing were graphite and austenite. (*Journal of Physical Chemistry*, vol. xii (1908), p. 507.) At a lower temperature these react to form a carbide of iron resembling cementite. The main points of his diagram are: graphite + austenite = Fe_3C at 1095° C.; at 800° Fe_3C changes over into Fe_3C and austenite; at 615° Fe_3C breaks up into Fe_3C and alpha iron (ferrite). A later research is Wittorf's (*Revue de Métallurgie*, 1912, p. 600), whose diagram shows a stable eutectic of austenite and Fe_3C at 1180° C. and 4.1 per cent carbon. Below 1130° C. Fe_3C decomposes into austenite and graphite.

The whole subject has been thoroughly discussed by Guertler (*Text-Book of Metallography*, vol. ii), who concludes that the stable system is as according to Wittorf, and that we have two metastable systems. The first shows the eutectic of graphite and austenite at 1150° C. with a eutectoid of alpha and graphite at 750° C. The second is our ordinary white cast iron with the eutectic of cementite (Fe_3C) and austenite at 1135° C. and the eutectoid of Fe_3C and alpha ferrite at 710° C. as already described. (Figs. 11 and 14.) However, at present the most satisfactory working diagram is the double one showing the two systems, stable and metastable.

The diagram explains in a very satisfactory manner the changes which take place from 0 to 2 per cent in the steel division, as in Fig. 22.

Starting with 0 per cent C or wrought iron,

Fig. 9 is a section of a piece of pipe skelp (magnified 35 diameters) etched with 10 per cent nitric acid. It consists of grains of pure iron or ferrite with more or less regular polygonal boundaries and some dark patches of slag, which are elongated in the direction of the rolling. Ingot iron shows the same structure, but without the included slag, because the metal was cast from the liquid state and is steel with only a trace of carbon and other impurities. In pipe steel of say 0.07 per cent carbon we find the same grain of ferrite, but in addition there are small dark-etching areas of pearlite containing 0.9 per cent carbon. As we pass from this low-carbon steel to that containing 0.9 per cent we find the amount of pearlite increases until it finally composes the whole grain. Figure 10, magnified 40 diameters, shows a piece of medium carbon steel cut from a 3½-inch shaft. The white areas are ferrite, the dark are pearlite. Under very high magnification pearlite is seen to be a mechanical mixture of ferrite and cementite, as shown in Fig. 11, where the fine hard white plates are cementite set in a groundmass of softer ferrite. The black patch is a particle of manganese sulphide. Now when the carbon reaches 0.9 per cent the whole steel is composed of pearlite, and in any steel up to this point the changes which take place on cooling from high temperatures are the same. Above the line *GOS* (Fig. 22) the metal is composed of homogeneous grains of austenite. The higher the temperature to which it is heated the coarser the grain. On cooling down no change occurs until the curve *GOS* is reached. The steel shown in Fig. 10 after forging cooled down normally until it reached the temperature *GOS*, when ferrite began to separate out and continued until at 700° (*PS*) the residual austenite grain changed over into pearlite.

With increase in carbon the pearlite increases and the temperature at which ferrite precipitates decreases, following *GOS*.

Above 0.9 per cent carbon a new constituent, cementite, appears as hard, bright envelopes around the grain. This cementite separates out in high-carbon steels when they cool down to the line *ES*, just as ferrite separated out of the low-carbon steel. The change in the residual austenite grain into pearlite occurs at 700° C., or *SR'*, as before.

HEAT TREATMENT

As a general rule a coarse structure means weakness. When a metal or alloy freezes, dendrites or pine-tree crystals generally form. Figure 1 shows typically the normal ingotism. In an ingot or casting of steel similar dendrites form and we have to break them up either by mechanical work or by heat treatment. Rolling or forging at a high temperature breaks them up, and the greater the amount of reduction of section brought about by the mechanical work, the finer the grain, as in the hot working of any metal or alloy. In the case of a casting we produce a fine grain by annealing or, more correctly, refining. When the temperature reaches the curve *AD* the metal begins to freeze and is completely frozen on reaching *AE*, Fig. 22. The rate at which the metal passes through this freezing range determines the grain size. When solid the casting consists of dendrites, or grains of austenite. No further change takes place on cooling until *GOS* is reached. Then ferrite begins to separate out around and in each grain

until on reaching *PS* pearlite forms. To obtain a very fine structure we have to reheat the casting to just above the line *GOS* in order to take the coarse ferrite into solution, for this gives us the finest grain. Heating to temperatures below *PS* causes no change of structure. On passing this temperature the coarse pearlite changes over into very fine-grained austenite. To complete the refining, however, we must get rid of the coarse ferrite, which we do by heating just above *GOS*. Thus the lower the carbon in the steel the higher the refining temperature. The changes which take place on heating are at a slightly higher temperature than on cooling, which is due to lag, so that in practice we have to heat say 25° C. above the line *GOS* for complete refining. Manganese, etc., make the lag more pronounced.

Occasionally such heat treatment fails to give complete refining. This is due partly to the fact that a steel casting may contain films of manganese sulphide and silicate, which act as nuclei on which the ferrite precipitated on cooling from *GOS* down to *PS*, and partly due to segregation of phosphorus.

In the heat treatment of high-carbon steel we have to heat just above *SE* to refine the casting, but such heat treatment, as a rule, gives a coarse grain, especially with very high-carbon content. But most high-carbon steel for tools, etc., comes in the form of forged or rolled bars and rods which have a comparatively fine grain. With very high carbon heating to just above *SE* causes overheating and often breaks down the carbide of iron, with the production of graphite. But on account of the fact that the envelopes of cementite tend to break down and form globules, heating to just above *PSK* generally refines the steel.

Hardening and Tempering. Hardening is heating to the austenitic condition and suddenly cooling, as by quenching in water, oil, etc. The more rapid the cooling the harder the steel; the greater the content of carbon the harder the material. The higher the temperature above *GOSK* to which the steel is heated the coarser the grain and therefore the more brittle. Hence the correct temperature to heat the steel for hardening is that point where it has just completely transformed into austenite, which is just above *GOSK*. It is not necessary to heat above *SE*, for cementite is already very hard.

Theoretically we ought to be able to prevent any change in the solid-solution austenite by extremely rapid cooling. In practice, however, this is impossible, and we find more or less decomposition in the quenched material. This decomposition is of two kinds. The outside of the grain of austenite may be changed over into a dark etching constituent called troostite; the nearer the centre of the bar, the more troostite occurs. In Fig. 13 is shown a steel with 1.4 per cent carbon quenched from a white heat. The section is taken from near the outside and the troostite occurs as dark-etching irregular envelopes to the grains of austenite and rounded patches within the grain. The centre of the bar showed comparatively little of the austenite, most of the grain having decomposed into troostite, for in the centre the cooling is much slower. Hence with very large sections it is impossible fully to harden the interior, for the heat is not conducted away rapidly enough to suppress the change of austenite towards pear-

ite completely. The second method of decomposition occurs within the grain itself. Curious chevrons and needles appear, with some semblance of octahedral symmetry. This is martensite. Figure 12 shows it in a steel with 2 per cent of C, $\frac{1}{8}$ inch square, quenched from 1100° C. The thin envelope to the very coarse grain is cementite. The grain itself shows the typical chevron structure of martensite. Martensite is extremely hard, austenite (found pure in nickel or manganese steel) is comparatively soft. Troostite is less hard and less brittle than martensite. Troostite itself changes over into submicroscopic pearlite, called sorbite, which is extremely strong and ductile. There is a whole range of structures between typical austenite, troostite and martensite, and sorbite, depending on the size of the section, the rate of quenching, and the temperature of quenching. The temperature from which the material was quenched determines the grain size.

Material as quenched is usually hard and brittle. By reheating to over 200° C. to 300° C. we "temper" the material, which causes a further decomposition of the austenite within the grain, but does not alter the grain size. The brittleness is decreased, with some loss of hardness. Within the grain the martensitic structure becomes more pronounced through the formation of troostite and sorbite and then becomes hazy, and finally sorbite and pearlite, and then pearlite alone, result, and the material is then dead soft.

Casehardening and Cementation. This is accomplished by heating wrought iron or low-carbon steel into the gamma range, packed in carbonaceous material, such as charcoal, bone meal, lampblack, etc., or by means of carbonaceous gases. According to Giolitti (*The Cementation Process of Iron and Steel*, 1915) the gamma iron absorbs carbon mainly through the agency of carbon monoxide gas.

The process of casehardening can be readily followed under the microscope. When the specimen has not been quenched a cross section can be cut and the changes in structure followed as they pass from the outside of cementite plus pearlite, or pearlite alone, through a zone of pearlite into ferrite plus pearlite, which gradually decreases in amount until finally the normal material is reached, which shows the limit of carbon penetration.

Alloy Steels. The metallography of alloy steels forms a subject in itself. They may be classified into three groups according to the predominant constituent: (1) pearlitic, (2) martensitic, (3) austenitic, of the air-cooled specimens. The presence of the alloy profoundly affects the critical temperatures, especially *GOSK*, and the ease with which the transformations occur. As an example of group 7 we have nickel steel with 3.5 per cent nickel. This closely resembles ordinary carbon steel in structure, although the grain size is usually finer, and when quenched the martensite is very much more pronounced. Chrome-steel, nickel-chrome, chrome-vanadium, nickel-chrome-vanadium, silico-manganese, etc., are all pearlitic. When quenched and tempered, however, martensite is very predominant and there are marked differences both in properties and structure. Manganese steel (Mn 12 per cent), when slowly cooled or cast, is composed of austenite with more or less carbide in and between the grains,

as in Fig. 12; for the manganese present has suppressed the *GOSK* change (Fig. 22) entirely and we have only the curve *ES* left. Quenching from 1050° C. prevents the separation of the carbide and the material is composed of polygonal grains of austenite. (See Fig. 8.) As examples of the third group we have air-hardening and high-speed steel, but their structure is by no means typical martensite. Small white grains of carbide usually occur in a more or less complex groundmass which may be at times austenite, at others martensite, at others pearlite. The differences, however, run parallel with the difference in hardness and physical properties.

Functions of Metallography. In conclusion, metallography does not compete with chemical analysis or physical testing. It supplements them. Chemistry tells us what elements are present; metallography shows us how they occur in regard to grain size, segregation, inclusion of impurities, etc. It is a method of determining cause of failure as well as of distinguishing material. In some cases this is easily done, as, e.g., distinguishing between wrought iron and steel, properly and improperly refined castings, segregated rail steel, etc. Some problems are more difficult, as the study of hardened alloy steels, especially high-speed, the corrosion of tubes, both of iron and steel, and of brass, etc. As in all scientific work, the answer comes sooner or later, and subjects at present unsolved may in time be unraveled by metallographic means.

Bibliography. Several publications available for consultation have devoted considerable space to metallography, viz., the *Zeitschrift für anorganische Chemie* (Leipzig); *Zeitschrift für physikalische Chemie* (ib.); the *Journal of the Iron and Steel Institute* (London); the *Revue de Métallurgie* (Paris); *Métallurgie* (Aachen), now divided into "Ferrum" and "Metal und Erz"; the *Journal of the Institute of Metals* (London); while the *International Journal of Metallography* (Berlin) is devoted to it exclusively. Several introductory textbooks have appeared, notably C. H. Desch, *Metallography* (New York, 1910); G. H. Gulliver, *Metallic Alloys* (Philadelphia, 1913); Rosenhain, *Introduction to Physical Metallurgy* (New York, 1914). The theoretical side is most ably dealt with in William Guertler, *Metallographie* (Berlin, 1912 et seq.), of which two volumes had been published in 1915.

Special papers of importance as dealing with the beginnings of the science are H. C. Sorby, in *Report of the British Association for the Advancement of Science*, vol. ii, p. 189 (London, 1864); *Journal of the Iron and Steel Institute*, vol. i, p. 140 (1886), and Martens, in *Zeitschrift des Verein deutscher Ingenieure*, vol. xxi (Berlin); also his papers in *Stahl und Eisen*, vol. ii (Düsseldorf, 1882), and *Verhandlungen des Vereins zur Beförderung des Gewerbfleisses* (Berlin, 1882).

For results of cold working of metals: *Journal of the Institute of Metals*, vols. vi, ix, xii (London, 1911-13); Grard, in *Proceedings of the International Association for Testing Materials* (New York, 1912); Galy-Aché, in *Revue de Métallurgie*, vol. x (Paris, 1913); Rosenhain, in *Engineering*, vol. xcvi (London, 1913).

For constitution of alloys, consult studies by Portevin, in *Revue de Métallurgie*, vols. v, vi (Paris, 1908-09), and Bornemann, in *Die binären Metallegierungen* (1909, 1912).

For studies of ternary alloys, consult: Stoeffel, in *Zeitschrift für anorganische Chemie*, vol. liii (Leipzig, 1900); Geer, in *Journal of Physical Chemistry*, vol. viii (Ithaca, 1904); Sahmen, in *Zeitschrift für physikalische Chemie*, vol. lix (Leipzig, 1907); Campbell, in *Proceedings of the American Society for Testing Materials*, vol. xiii, p. 657 (Philadelphia, 1913).

METALLURGY (from Gk. *μεταλλουργός*, *metallourgos*, metal working, from *μέταλλον*, *metallon*, metal, mine + *ἔργον*, *ergon*, work). The art of extracting metals from their ores and adapting them to the various purposes of manufacture. As the oldest written records of the world's history contain references to metals and their uses, the indications are that metallurgy is an art that was practiced in very early times. The ancient Egyptians and Hebrews were skilled in the working of metals, and the art must have been known and practiced before the dawn of history. Metallurgy may be divided generally into two grand divisions, mechanical metallurgy and chemical metallurgy. Mechanical metallurgy is that procedure usually included under the head of ore dressing (q.v.) and means the mechanical separation of a metal from its ores without recourse to chemical assistance. When the metals occur in a native state this procedure is possible, but, since such occurrence is comparatively rare, purely mechanical metallurgy is not widely adopted. There are a few cases in which it is applicable, such as when native gold occurs in coarse form. In such cases the rock may be broken fine enough to liberate the particles of gold, which then may be separated from the rock by water concentration. Chemical metallurgy includes all processes in which chemical changes are essential. This branch includes by far the greater part of the systems actually in use. The recovery of metals from all ores in which they occur in other than free and native condition involves chemical changes and is therefore within the realm of chemical metallurgy.

Most systems of ore treatment are a combination of mechanical and chemical metallurgy. In a broad way there are five systems under which all metallurgical processes may be classified. These are *concentration*, *amalgamation*, *leaching*, *roasting*, and *smelting*. *Concentration* is the removal of the gangue or barren part of an ore from the rich or mineral-bearing part, or, in other words, concentrating the metal into much smaller bulk than it occupied in the original ore mass. There are two methods of accomplishing this result. The first is by *gravity separation*, in which either water or air is used as a suspending medium, allowing the heavier metal-bearing portion to settle and thus separate itself from the siliceous gangue. *Flotation*, the second system, separates mineral from gangue by virtue of causing the former to float on the surface of water, either by the use of oil, oil and acid, or by utilizing the principle of surface tension. Flotation is a comparatively new process, the field of which is constantly widening. It is being largely applied at the present time in the wet treatment of copper.

Amalgamation is that system of metallurgy which makes use of the property which mercury possesses of amalgamating readily with gold and silver. Ores are crushed and mixed with mercury, the resulting amalgam being then separated by washing out the remaining gangue. The amalgam is then subjected to a distillation

process in which the mercury is volatilized, leaving the pure metal behind. The amalgamation treatment is usually limited to those ores in which gold occurs free and uncombined, since the metal in chemical combination is not amalgamable. Occasionally silver ores may be amalgamated, an example being the rich ores of the Cobalt district, in Canada, but silver rarely occurs native and is therefore not often amalgamable. See **GOLD**.

Leaching is the system of extraction in which the ore is treated with aqueous solutions of a solvent which acts upon the metal to be recovered. Three classes of solutions are used under special circumstances—acid, saline, and alkaline. As an example of the first may be mentioned the leaching of copper ores with sulphuric-acid solutions. Use of saline solutions may be typified by the leaching of precious-metal ores with cyanide solutions or the leaching of silver ores with sodium hyposulphite. Among alkaline treatments are the ammonia solutions often used for dissolving copper oxide from ores. Leaching may be accomplished by grinding the ore to a granular form consisting of particles varying in size from 0.5 inch to 0.002 inch, placing it in tanks equipped with false filter bottoms, and applying the solvent solution at the top, allowing it to percolate through the ore bed; or the rock may be ground to an exceedingly fine condition and mixed with the solvent solution, being maintained in suspension by mechanical means and separated after the treatment period by filtration or settlement. Other methods which have been well known are included in leaching—chlorination for example. The class includes all the wet metal-dissolving processes.

The roasting system of treatment includes those in which the ore is heated with access of air, but short of the point of fusion. In this way carbonates, such as those of zinc (ZnCO_3) and lime (CaCO_3), are brought down to the oxide form, the mineral losing carbonic-acid gas. The process also serves to drive off elements which occur in combination with some minerals, as, e.g., the roasting of sulphides, driving off the sulphur as sulphur dioxide and leaving usually an oxide of the metal. Roasting is widely practiced, but can only rarely form a complete cycle of metal production from ore.

Smelting is the final great class of metallurgical processes and may be called the most important of all of them, since it produces by far the greatest quantities of metal. The process consists of the application of heat together with the addition of materials which induce chemical reactions, the result being molten metal and a melted slag composed of the ore gangue and materials which have been added as flux. The process is one which is applied in special ways to a wide variety of metal ores. It may, and often does, account for the entire cycle between crude ore and metal in the form of raw material for manufacture. Smelting is accomplished usually in furnaces of one of two types—the reverberatory furnace, in which the material to be treated is placed on a bed separate from the fuel or heating agent; and the shaft or blast furnace, in which fuel for generating the required heat is mixed with the ore and flux charge.

Smelting is an extremely ancient process, since the extracting of iron from its ores in blast furnaces was practiced among the hill

tribes of India at least 3000 years ago. Iron ore and charcoal are put into a small blast furnace, worked with a goatskin bellows, and several hours are required to produce the small quantity of iron a man might carry in one hand. Smelting is utilized in the recovery of iron, copper, lead, zinc, gold, silver, antimony, nickel, and many other metals. In the recovery of many of these metals it is not the only process which may be used, but in the cases of iron, copper, lead, and some others it is practically the only system in commercial use. Gold and silver are recovered by practically all the classes of metallurgical treatment, but a great quantity is produced directly through smelting.

Electricity has become largely used in metallurgy in recent years, and its application has given rise to the coining of the term "electrometallurgy." It is not, however, a division of the metallurgical art, since the basic principles have not been changed in its use. Electrical action is employed to provide, either more conveniently or more cheaply, means for generating heat or inducing chemical changes that were formerly obtained in some other way. For example, electric furnaces have been built for smelting iron by the heat of the electric arc. Here electricity has supplied heat in a convenient way, but the process of smelting has been in no way changed. In a like way many metals are precipitated from their solutions by the use of the electric current, promoting economy and convenience, but acting essentially as auxiliaries to the formerly known processes. It seems, therefore, that the creation of a metallurgical division under the heading of electrometallurgy is hardly justified at this time. An ore can often be treated entirely by systems that come under but one of the general metallurgical methods, but often a combination of two or more of them is required to effect the recovery of a single metal, and at times all of them are used upon one ore. Thus, a gold ore might be subjected to amalgamation, concentration, and leaching with cyanide solutions, and the concentrates produced might be roasted and finally smelted, thus combining in the treatment of a single ore some process under each of the general divisions of metallurgy. Some of the mechanical operations of metallurgy pertaining to treatment of ores are described under **ORE DRESSING**; other mechanical operations, referring to the working of metals, as well as the chemical treatment, which differs in detail for each metal, are described in the articles on the various metals. See **ALUMINIUM**; **COPPER**; **GOLD**; **IRON AND STEEL**; **LEAD**; **MERCURY**; **NICKEL**; **PLATINUM**; **SILVER**; **TIN**; **ZINC**; **ETC.**

Hofman, *General Metallurgy* (New York, 1913); W. C. Roberts-Austen, *Introduction to Study of Metallurgy* (6th ed., Philadelphia, 1910); and the works cited in the articles on the various metals.

METALS AND METALLOIDS. See **PERIODIC LAW**.

METAL WORK. A term applied to decorative objects made of metal. The metals and alloys most often used are iron, bronze, brass, gold, silver, copper, tin, and lead, and the principal methods of treatment employed are casting, hammering, spinning, drawing, and stamping. (For description of these processes, see

FOUNDING; REPOUSSÉ.) Because of its scarcity and value the use of gold has generally been confined to small objects of personal luxury and adornment, although the Greeks frequently used it, in connection with ivory, for statues of the gods. (See **CHRYSELEPHANTINE; PLATE; JEWELRY.**) The use of silver is also thus limited, though to a less extent. Although copper in a pure state was employed for ecclesiastical ornaments from the twelfth to the fifteenth century, its chief use has always been as an alloy with tin in the form of bronze. In this form it is the metal most used by sculptors for both statues and reliefs. This is due to the fact that its high fluidity when melted, its slight contraction upon cooling, and its hardness render it peculiarly adapted for casting. (See **BRONZE;** and on bronze doors, see **DOOR.**) Brass, an alloy of copper and zinc, was used during the Middle Ages for sepulchral slabs, the design and lettering being engraved. (See **BRASSES, SEPULCHRAL.**) Modern lamps and lighting fixtures are usually made of brass, but sometimes of bronze; andirons and other fireplace furniture, of iron, sometimes with brass ornaments. Brass plate lends itself to spinning just as naturally as tin plate (iron or steel plate coated with tin) does to stamping. The domestic dishes and utensils that formerly in Europe and America were made of copper, brass, or pewter, are to-day, except in the Orient, stamped inexpensively by automatic machines out of tin plate. By reason of its great contraction upon cooling iron is less adapted to casting; but its extreme malleability and adhesive qualities when heated only to redness render it easy to forge under the stroke of the hammer. From the thirteenth century to the eighteenth it was extensively used with high artistic success for screens, gates, and the like, though the attempted revival in our day cannot be pronounced equally successful. (See **IRON AND STEEL.**) Steel is also extensively used in the beautiful inlay work of Oriental nations. During the Gothic centuries iron was the favorite metal of the locksmith; among the Greeks and Romans, and since the beginning of the Renaissance, brass and bronze. See **LOCK; DAMASKEENING; INLAY; INDIAN ART.**

Architecture. The metals chiefly used in architecture are iron and steel, bronze, copper, lead, and zinc. Their uses may be broadly divided into the structural and the decorative.

Iron and Steel.—It is only within the past century that these have come into extensive use for structural purposes. Their applications in modern fire-resisting structures are treated in the articles **FIREPROOF CONSTRUCTION** and **SKYSCRAPER** (qq.v.). Another important field of use—and, indeed, that for which they are peculiarly adapted and to which they were applied long before the development of modern fireproof construction—is the roofing of wide spans by means of trusses. The earliest example of this use, which the French inaugurated and have developed with consummate artistic skill, was the iron dome which replaced the earlier wooden dome of the Halle au Blé, Paris (now the Bourse du Commerce), after the fire of 1811, and which is still in perfect condition. In 1839 an iron-framed roof was built over the vaults of Chartres Cathedral. In both of these the main members were of cast iron. The great Halles Centrales in Paris by Baltard (1846-52) and the Crystal Palace at London (1851) employed cast-iron columns with trusses chiefly of wrought

iron. In all modern work wrought iron and steel have almost completely displaced cast iron. Very notable French examples of artistic construction in iron were the exhibition buildings of 1878, 1889, and 1900; the roof of the "Salle des Machines" (1889) had a span of over 360 feet, with pointed-arched trusses of great beauty. In the vaulted ceilings of the Bibliothèque Nationale, Bibliothèque Ste. Geneviève, and church of St. Augustin the French in 1850-72 made interesting experiments in combining a decorative iron framework with brick, terracotta, or plaster fillings. The earliest iron structure in the United States was the beautiful Crystal Palace of the World's Fair at New York in 1858, in Bryant Park; it was unfortunately destroyed by fire the same year. The iron and glass roof of the train shed of the first Grand Central Depot in New York (1871) was an unusually elegant work; but, in general, American examples lack the elegance of the French. The widest span ever roofed with iron (or steel) and glass was that of the Liberal Arts Building of the Chicago World's Fair (1893); the arched trusses had a clear span of 387 feet and a height of 211. Many very beautiful bridges have been built with spans of steel arches; e.g., the Eads Bridge at St. Louis, the Washington Bridge over the Harlem at New York, the Alexander III Bridge at Paris, etc. It was the great cost and scarcity of iron that prevented its wide use for construction previous to the nineteenth century; but an iron beam bedded in cement was found among the ruins of the Baths of Caracalla (Rome, 202 A.D.), proving that the Romans used it in exceptional cases. In the Middle Ages its chief use was for gates, grilles, decorative hinges, and (in Italy) tie-rods; in the Renaissance it appears also in balconies and balustrades.

Bronze.—For decorative work in architecture bronze holds the place of honor. It was early hammered into reliefs by the Assyrians (Balawat Gates) and the Mycenæans; cast in large masses by the Phœnicians, as in the columns "Jachin" and "Boaz" for the Temple of Solomon (c.1000 B.C.), and the great laver for the court of the same temple; employed by the Romans for the roof of the Pantheon portico (c.120 A.D.) and for its superb doors; in the Middle Ages for bronze-plated and solid-bronze doors of great splendor; in the Renaissance and in modern times for sculptural adornments of all kinds—for doors, grilles, railings, candelabra, and such objects as mast bases (e.g., those at Venice in front of St. Mark's); and also for the minor adornments and details of furniture, tombs, etc.

Copper, zinc, and lead in sheet form are used for covering roofs in place of slates or tiles, and for gutters and spouts, on account of their resistance to the weather. Copper and lead, beaten or cast into decorative forms, are used also for the finishing and adornment of roofs, in the forms of hip rolls, crestings, finials, and the like; and copper and galvanized iron for gutters, *chénœaux*, or high gutter fronts, and even cornices. The use of sheet metal for hollow counterfeits of stone is a reprehensible modern device for cheap pretentiousness which, though widely practiced as an organized trade, deserves no mention as a fine art. The use of bronze in sculpture does not belong in the scope of this article. See **SCULPTURE.**

Bibliography. The authorities on the tech-

nique and history of the different kinds of metal work will be found under the titles cited above. Among the special manuals on the subject which have been written at different periods are: the treatise of the Monk Theophilus, "*Diversarum Artium Schedula*" (twelfth century), published in *Quellenschriften für Kunstgeschichte*, VII. (Vienna, 1877); Cellini, *Trattati dell'oreficeria e della scultura*, edited by Milanesi (Florence, 1856); Vasari, *Tre arti del disegno*, part ii, edited by Milanesi (ib., 1882); Garnier, *Manuel du ciseleur* (Paris, 1859); Hefner-Altenach, *Serrurerie du moyen âge* (ib., 1869); W. W. Kent, *Architectural Wrought-Iron* (New York, 1888); F. S. Meyer, *Handbook of Art Smithing* (ib., 1896); *Lexicon der Metalltechnik* (Vienna, 1900); Codron, *Travail des métaux dans les ateliers de construction mécanique* (London, 1901); Haas, *Der Metallarbeiter* (1902); J. S. Gardner, *English Ironwork of the XVII and XVIII centuries* (ib., 1911).

METAL-WORKING MACHINERY. The purpose or function of both of the two general classes into which metal-working machinery is divided is to apply power to the forming or shaping of metallic raw material into the desired finished or wrought forms as required by commerce, industry, or the engineer's designs. In one class are the power-driven machines which are designed to produce one article only in great numbers (and possibly in varying sizes) and usually with some degree of automatic action so far as human supervision is concerned. These are properly styled *special machines*. Such are screw-making machines, bolt threaders, nut tappers, gear cutters, spring-making machines, and the like. They usually turn out a product complete, or a process complete, with little or no requirement for subsequent finishing. The other class of power-driven forming or shaping machines includes those which are not special but general in their function and operation, adaptable for doing all kinds of work in their classes on all shapes of stock or raw material. These are properly called *machine tools* and are controlled by the intelligence of the workman and are not to be designated as automatic in any sense. They can of course be made to produce large numbers of duplicate articles, but this is not their normal use. They usually perform a process, or one of several processes, on an article in the course of its production, but they are not machines of production or manufacture in the sense that the special machinery is which turns out a finished product in one completed continuous operation.

It is obvious that the special-machine class of metal-working machinery is as large and as diversified as the mechanical ingenuity of designers and the needs of economic manufacture. Such machines have found their greatest development in the construction of parts for sewing machines, typewriters, arms, cartridge work, motor vehicles, and metallic articles in general.

Metal-working machinery in both classes operates to form or shape the stock or raw material, first by bending or pressure, which creates no chips or leavings; second, by shearing, which separates the blank or work from the general mass or stock, again without chips when dies are used; third, by a paring process, in which the metal which is superfluous is reduced to chips by a cutting tool acting upon the surface or by abrading machines or grinders

which comminute the material attacked. Machine tools will include in the first class hammers, presses, and riveting machines; in the second class punches and shears; and in the third class drills, lathes, and boring machines,

FIG. 1. RIVETER.

planers, surfacers, and milling machines for producing plane surfaces, and emery wheels for sharpening and for producing true surfaces.

Tools of Pressure or Impact. The important tools in this class are hammers and riveting machines. These, however, usually act on metal which has been softened and made plastic by heat, and are therefore more properly forging machines. See FORGE, FORGING.

Riveters are employed for driving and heading hot rivets in making riveted connections in boiler work, in bridge work, structural work, etc. They are built in a great variety of forms, but the most usual portable form derived from the larger stationary types has a U-shaped frame or yoke having at the ends of the arms interiorly projecting dies, one of which is stationary while the other has a reciprocating motion. The rivet after being inserted in the hole is squeezed endwise between these two dies until it clamps the work together and a head is formed. Figure 1 shows a common form of such portable riveter.

FIG. 2. HYDRAULIC PRESS.

The moving die is operated by means of a steam or compressed-air cylinder. The more massive stationary machines are designed for boiler shells and flues, and the work is presented to

them by cranes. Such riveters are often operated by hydraulic pressure.

Presses are used for forming sheet metal into desired useful forms by means of pressure between dies. Figure 2 shows a hydraulic press for such work as watchcase making which is operated by a belt-driven pump. The same type of machine of larger capacity will be used for flanging boiler plate or shaping armor plate for vessels. The operation of presses of this style is described in the article on the hydraulic press (q.v.). Presses are made for both the hot and cold working of metals. A form of hot-working press, generally horizontal in action, used in bending axles and frame members for motor vehicles, rails, and other structural shapes, is called a bulldozer. The illustration Figure 3 shows a familiar form of bulldozer press. The cold sheet-metal-forming presses for lighter shapes are usually vertical and can produce quite complicated forms in several successive processes. The drop press is also in this class.

Bending rolls are used for bending metal plates to suitable curves for boiler and tank work. They usually consist of three rolls, arranged in the form of a triangle, between which the plate is drawn by the rotation of the rolls.

FIG. 3. BULLDOZER PRESS.

The relative adjustment of the rolls determines the curve to which the plate is bent. The accompanying plate shows a horizontal bending roll operated by a special steam engine. These rolls will take in plates 24 feet wide. Vertical rolls of similar construction are also made.

Tools for Shearing or Punching. The tools in this group operate by cutting metal of relatively thin stock, so as to separate a desired shape from a larger mass of stock or to cut holes in the latter by a punching process. The metal is sheared along the parting line, and the tool must have power to overcome this considerable and massive resistance along an area of some magnitude and extent. Punches operate by the thrust of a cylindrical or spirally ended cylinder plunger or tool forced through the metal, while the edges of the desired hole are held up and limited by a die below it. Single and multiple punches are built capable of punching one or several holes at once. For light work punches are usually driven by belts, but for heavy work individual steam engines or hydraulic cylinders are the motive powers used. Where holes are to be punched at regular intervals automatic spacing tables are often used in connection with punches. Figure 4 shows a single punch of familiar construction. Horizontally acting punches are also constructed.

Shears are used for cutting off or shearing metal plates and shapes, and resemble punches in construction and operation except that the punching tool and die are replaced by cutting edges which slide past each other like the blades of scissors. Figure 5 shows a type of plate

FIG. 4. PUNCH.

shears. Machines of this kind are built wide enough to shear plates 10 feet wide. For shearing angle-iron and other shapes special forms of shears are often made.

Tools for Paring Chips from the Stock. Tools in this class are historically the oldest, since they are developed from the hand-operated devices of the earliest industries. The principal tool in this group is the lathe, sometimes called the "king of machine tools." Here the work is revolved by power, and the point of the cutting tool held rigidly against undesired motion and fed parallel to the axis or at right angles thereto will cut away by a wedging action the metal which is outside of the surface of revolution to an extent determined by the position of such cutting point. Lathes turn cylinders, cones, and surface of revolution. They can also bore or generate hollow surfaces of revolution. They are driven either by belts or electric motors self-contained in their structure, with or without gearing. They have capacities from the smallest machine used by dentists and jewelers up to

FIG. 5. SHEARS.

the massive ingot lathes or those for machining the driving wheels of locomotive engines or the flywheels of steam engines. The work, firmly held in a chuck, revolves in the lathe, and the tool is rigid except for the feed motions im-

parted to it. The axis of revolution may be either horizontal or vertical. The lathe passes into the boring machine when the work is held rigidly on a chuck or faceplate and the tool is driven by power and fed to its work. Boring machines are used in boring and rifling guns and gun tubes and sleeves and in making true cylinders for engines and motor vehicles.

The boring machine is differentiated from the drill or drill press only by the diameter of the hole it cuts or forms. The drill usually forms its hole by cutting into the solid; the boring machine cuts on the sides of a hole already formed and does not cut at the bottom or end of such hole. A drill does not cut holes over 2 inches in diameter; a drill cuts on its end and not its sides. The lathe as a general machine tool can be transformed into a special machine for rapid production by the expedient of mounting special cutting elements or tools in a head of proper construction and feeding these tools in succession against the revolving stock. As these carrying heads resemble a turret of a warship in form and movements, such lathes are called turret lathes. The turret is usually on a vertical axis and is borne on a bed carriage; horizontal turrets are used in certain designs. The use of stops eliminates the necessity of pauses to caliper or measure the work in progress, and the entire product will be of the same dimensions until the tools wear.

Drill presses similarly become special tools when multiple spindles in determined relations to each other bore several holes at once at standard distances and positions. The plates illustrate standard drills and boring machines. The universal form of the drill press is the radial drill, in which the drilling spindle has adjustments for position both laterally and in and out and the work is held rigidly upon a faceplate or table or on a floor plate which is truly at a right angle to the drill spindle in all the positions of the latter.

The second group of tools which shape by cutting chips from the surface are the planers and shapers, which have linear motion only. In the planer the tool is held rigidly except for feed motions and the work moves against the tool; in the shaper the work is held in a chuck or on a table and the tool reciprocates back and forth over it. The planer will develop a surface as nearly plane as are the ways which control the motion of the bed; the shaper will develop a surface as plane as the springing of the tool carrier will admit. The latter machine is limited to work on smaller flat or curved surfaces. The slotter is a shaper with the stroke vertical instead of horizontal, and is used for working and finishing locomotive frames, for key-seating and similar work where it is convenient to have the work lie in a horizontal plane and be formed by paring metal at right angles to its greatest dimension.

The planer rarely or never becomes a special machine; the shaper becomes one when its principle is used to form the teeth of gears by having a reciprocating cutter develop the elements of a tooth profile by following the outline of a former having the desired shape, while the gear blank is held continually in the line of the axis of its proposed revolution. Planers and shapers usually cut in one direction or traverse only; to save time the idle traverse is made at higher speed. Such tools are said to have quick return.

The fourth group of machine tools acting to form metals by cutting or paring the surface is that in which the work is rigidly held except for feed motions and the cutting tool revolves against or over the work. The cutters have multiple cutting edges like a circular saw. Hence they last a long time before regrinding makes a readjustment necessary, and duplicate shapes and dimensions can be cheaply and exactly reproduced in manufacture. Such machines are called milling machines, and the revolving cutters are called mills. The mill may have a desired profile to produce a desired shape on the stock over which it moves as it revolves. Milling machines may have vertical or horizontal axes for the cutters. A special form of edge miller is called a profiling machine. Millers may generate and cut spirals or helices, and are much used for cutting the teeth of gear wheels. They then become special machines, but can easily be made automatic as respects the dividing of the circumference of the wheel into equal parts and cutting the tooth space of the required shape. Figure 6 illustrates the so-called plain milling machine and Figure 7 the range in types of cutters which may be used.

FIG. 6. PLAIN MILLING MACHINE.

The milling machine is the highest development of the machine tool in its class and with the turret lathe lies at the bottom of American supremacy in rapid and cheap production. It will work to a dimension varying only one-half of one-thousandth of an inch from a desired standard size.

The metal saw is in the class of the milling machine for cutting beams and other metallic masses, like armor plate, to shape. The saw may have inserted "bits" of hardened steel in a softer plate, or diamond facets may be similarly used, or the teeth may be made in the saw disk itself. In Figure 8 is shown the beam saw where the beams are clamped in place and the revolving saw traverses at right angles. Less usual is the toothless saw, a disk of soft steel, about three-sixteenths of an inch thick and perhaps 42 inches in diameter. This disk is made to revolve with a speed at the circumference of

15,000 feet per minute, and grinds its way through the metal. If the speed is increased to about 25,000 feet per minute, it becomes a fusing disk and melts the abraded particles. The work should be slowly revolved as fed to

FIG. 7. MILLING CUTTERS AND TOOLS.

the fusing disk to prevent excessive local heat and change of shape in the work.

The United States is a large manufacturer of metal-working machinery, the exports under this specific title having increased from \$3,716,709 in 1904 to \$14,011,359 in 1914.

Bibliography. A large number of books dealing with machine shops and tools are available, but in most cases the most recent practice will best be described in the current files of such journals as the *American Machinist* (New York), *Power* (ib.), *Machinery* (ib.), and *Journal of the American Society of Mechanical Engineers* (ib.); while the catalogues of the more important machine-tool makers can be studied with considerable profit. METAMERISM (from Gk. *μετά*, *meta*, after + *μέρος*, *meros*, part). In zoölogy a term equivalent to segmentation, as seen in the worms whose body is divided along the primary or longitudinal axis into segments, homologous with each other, which are technically called somites or metameræ. Each metameræ or segment contains a chamber or compartment of the body cavity and a section of the alimentary canal and other organs. The external appendages, or the so-called segmental organs, are said to be segmentally or metamERICALLY arranged. Metamerism is most obviously exhibited in worms and arthropods, as the lobster, myriapods, and insects. Vertebrate animals, also, in the nervous system and some of the other organs, show a tendency to a repetition of segments, i.e., to metamerism.

METAM'NEH. A town of Galabat (q.v.).

METAMORPHIC ROCKS. One of the three great divisions of the rocks (see ROCK) characterized generally by a foliated or schistose structure and including: (1) rocks which have been shown to be altered (metamorphosed) igneous rocks (q.v.); (2) rocks which have been shown to be altered sedimentary rocks (q.v.); and (3) rocks which, while resembling one or both of these types, do not allow of a definite determination of their origin. This implies that the product of metamorphism acting upon a sedimentary rock may be indistinguishable from the result of the same agencies acting upon an igneous rock. There are, however, certain limits of composition fixed by the laws of consolidation of rock magmas that restrict somewhat the composition of metamorphic rocks which can have had an igneous origin, the processes of metamorphism having been shown in the great majority of instances not to have altered in an important way the ultimate composition of the rock as a whole. The metamorphic rocks are as a class those of which the processes involved in their alteration have been active within the crust of the earth, and are exclusive of those formed through the chemical action of the atmospheric agencies, the latter class being generally designated residual rocks (q.v.). See METAMORPHISM.

Metamorphic Sedimentary Rocks. The principal metamorphic sedimentary rocks are definitely related to the unaltered sedimentary rocks, principally, however, in respect to composition. Thus marble (q.v.) and crystalline limestone (q.v.) are metamorphosed limestone, and dolomitic marble is the product of metamorphism of dolomite. Quartzite (q.v.) and quartz schist result from the metamorphosis of arenaceous rocks, and by the recrystallization of

contained iron ore or by the impregnation by ferruginous material they become jaspilite (q.v.) or hematite rock. The argillaceous rocks produced by the same processes are slate, phyllite, mica schist, hornblende or actinolite schist, garnetiferous schist, staurolitic schist, and the rarer types of hornfels or hornstones (q.v.), albite schist and chiastolite schist.

Metamorphic Igneous Rocks. The types included under this head may generally be recognized by the partial preservation of the peculiar textures of igneous rocks; such, e.g., as the granitic, porphyritic, vitreous or glassy, spherulitic, pearlitic, etc. (See IGNEOUS ROCKS.) These structures are, however, almost always obscured by the presence of parallel or approximately parallel sets of fissile planes which are collectively referred to as the schistosity of the rock. (See METAMORPHISM.) There may be several sets of these fissile planes, but when two or more are present it is generally impossible to determine whether the rock had an igneous or a sedimentary origin, and it would be relegated to the third class of metamorphic rocks. It has been found that igneous rocks which were originally glassy in texture are liable to devitrification, the product of which process is a rock of microcrystalline or cryptocrystalline texture. Metamorphic rocks of this derivation are named in terms of the rocks from which they have been derived with the addition of the prefix *apo*; as, e.g., aporhyolite, from rhyolite (q.v.). If, however, the induced texture is that of schistosity or foliation alone, a structure which must be referred to the processes known as dynamic metamorphism, the original name of the igneous type is joined to the textural term "gneiss"; as, e.g., *granite-gneiss* from metamorphism of granite (q.v.). *Granitoid gneiss* is the equivalent of granite-gneiss. The third class of metamorphic igneous rocks owe their origin chiefly to the chemical alteration (recrystallization) of igneous rock types with the abundant development of new minerals out of old ones. Such rocks are steatite or soapstone (q.v.), from the development of talc, and serpentine rock (q.v.), from the development of serpentine, in rocks of dominant magnesian composition.

Consult: Zirkel, *Lehrbuch der Petrographie*, vol. iii (Leipzig, 1894); Diller, "The Educational Series of Rock Specimens Collected and Distributed by the United States Geological Survey," in *United States Geological Survey, Bulletin 150* (Washington, 1898); Pirsson, *Rocks and Rock Minerals* (New York, 1908); Rosenbusch, *Elemente der Gesteinslehre* (Stuttgart, 1910).

METAMORPHISM. A term commonly used by geologists to indicate the profound changes which some rocks have undergone. It is particularly applicable to those modifications that are usually accompanied by an increase in hardness and degree of crystallization from the original conditions. Metamorphism may lead also to the mineralogical reconstruction of rocks. The changes which occur in the outer zone of the earth's crust as the result of weathering and hydration are embraced under the term "katamorphism." The metamorphic processes are characteristic of the deeper zone under the influences of heat and pressure. The phenomena of metamorphism are commonly met with in nature, particularly in the regions underlain by ancient rocks, where the processes of upheaval and subsidence and volcanic forces have operated

through long periods of time. The degree to which rocks have been changed varies from mere hardening in some cases to an extreme marked by complete alteration in structure and composition.

Kinds of Metamorphism. Strata in the vicinity of igneous intrusions, as dikes and bosses of granite, are more or less metamorphosed and show an increase in hardness and crystallization. In this kind of metamorphism, called *contact metamorphism*, the amount of change effected depends upon the character of the invading rock and the rock that has been invaded, and also upon the proximity to the contact. Deep-seated igneous masses exert greater influence than surface flows of lava, doubtless because of the greater heat and longer period of cooling; while those of acid composition in which there are large quantities of occluded gases and vapors are more effective than basic types. The character of the strata invaded by the igneous rock largely determines the extent to which new minerals are formed; sandstone usually shows no change beyond a hardening or recrystallization of the quartz particles, but clay rocks, such as shales and slates, exhibit a complete rearrangement of the chemical constituents with the formation of new minerals. Limestones are also greatly changed along the contacts with igneous rocks, undergoing a crystallization so as to form marbles and developing new minerals by combination of the materials in the limestones with those given off by the igneous intrusions. In such contact zones valuable ore deposits may be present, especially deposits of copper, lead, and silver ores.

A second form of metamorphism by which rocks have been influenced over wide areas depends upon the energy developed by the great stresses and movements within the earth's crust; this is called *regional or dynamic metamorphism*. The first stages of regional metamorphism are indicated by hardening and the loss of volatile substances; but, as the strains of compression and shearing increase, the rock assumes a schistose structure and its constituent minerals are more or less completely recrystallized. The change effected may amount to a thorough transformation, as from an unaltered sediment to a homogeneous crystalline mass resembling an igneous rock. In most cases the influence of pressure in producing such metamorphism is manifest in the foliated or schistose structure which the rocks exhibit.

Causes of Metamorphism. Heat, pressure, and moisture are the most effective agencies in producing the changes known as metamorphism. The influence of heat is shown in igneous contacts, but it is also an accessory in regional metamorphism, although pressure is here the dominant factor. Moisture, which is present in all classes of rocks, assists in decomposing minerals and in the formation of new compounds. The phenomena of metamorphism have been imitated in an experimental way by subjecting specimens of various rocks to the influence of heat and pressure. Consult Archibald Geikie, *Text-Book of Geology* (London, 1903), and Johnston and Niggli, "The General Principles Underlying Metamorphic Processes," in *Journal of Geology*, vol. xxi (Chicago, 1914). See GEOLOGY; METAMORPHIC ROCKS.

METAMORPHOSES. The name of two famous Latin works, one in verse, by Ovid (q.v.), the other in prose, by Apuleius (q.v.).

METAMORPHOSIS (Lat., from Gk. *meta-*

μόρφωσις, from μεταμορφοῦσθαι, *metamorphousthai*, to be transformed, from μετά, *meta*, a prepositional prefix often suggesting the idea of change, + μορφή, *morphē*, form). In the mythology of the ancients, those transformations of human beings into beasts, stones, trees, and even into fire, water, etc., in fables with which that mythology abounded. Writings dealing with such transformations were called metamorphoses (q.v.). See APULEIUS; OVID; FOLKLORE; WEREWOLF.

METAMORPHOSIS, IN ANIMALS. A change of form in the postembryonic life of an individual animal. The term is also applied to the change in form of homologous parts in different species.

The young of many animals pass through a series of changes of form, in each of which the animal is adapted to changes in its surroundings, involving alterations in its mode of life,

HYPERMETAMORPHOSIS OF OIL BEETLE.

a, first larva; b, second larva; c, third larva; d, pupa; e, mature beetle.

slight if the change of body form is slight, thoroughgoing and radical if its body becomes profoundly modified. As examples of a complete metamorphosis may be cited the life histories of the jellyfish (q.v.), the starfish, mollusks, crustaceans, insects, and also the salamanders, toads, and frogs. The result of this change of habits and form undoubtedly is to prevent the extinction of the species, since if at a given moment the parents were swept out of existence, the young, living under very different circumstances, would survive, develop, and represent the species. Again, in the marine species of worms, crustacea, etc., the free-swimming young (larvæ) are borne about by oceanic and tidal currents, and in this way what in adult life are the most sedentary forms become widely distributed from one part of the world to another. On the other hand, the larval forms of fixed marine animals serve as food for fishes, especially young fishes, and numerous invertebrates. Thus, were it not for the metamorphoses of animals, many species would become extinct sooner than they do, while the great overplus of larval forms gives to many other species of animals a secure hold on existence.

As an example of metamorphosis we may cite that of a butterfly. Its life is divided into four stages—the embryo passed within the egg, the larva, pupa or chrysalis, and imago. Such an insect after hatching lives, so to speak, three different lives, having distinct bodily structures and existing under very different conditions as regards food, enemies, etc. The caterpillar, e.g., has big jaws, which in the winged or adult state are entirely wanting or so modified that the mouth is a suctorial one. Other radical changes are observable in the body and appendages and also in the internal organs. The term "larva" (q.v.), as applied to the first stage of animals, is a very variable and indefinite one, that of insects in general being a much more highly organized

animal than the larva of a worm, starfish, or crustacean. Primitive wingless insects (synaptera) do not pass through a metamorphosis. The metamorphosis of higher insects, whether winged or wingless, is of two sorts—complete and incomplete. The butterfly furnishes an example of complete metamorphosis. An example of incomplete metamorphosis is that of locusts or grasshoppers. In these insects the freshly hatched young differs from the adult only in being without wings. The different stages of metamorphosis are not primitive, inherited from some early form, but are acquired characters; the nauplius stage of most crustacea, and the caterpillar, maggot, or grub of insects, are forms which were adaptations to changed modes of life, inducing use or disuse of certain organs. At first insects were ametabolous and it was not until perhaps the middle of the Paleozoic era that insects with a metamorphosis began to exist.

Hypermetamorphosis. A condition in insects wherein they pass through more than the three normal stages. The best-known examples are the supernumerary stages of *Meloë*, *Stylops*, etc. In the oil beetle (*Meloë*) the freshly hatched young is an active, minute campodiar-like larva, which is found on flowers. It crawls from these to the bodies of bees and is carried by them to their nests, where it feeds upon the bee eggs. This sedentary mode of life reacts upon the organism, and after molting in the second larval stage it is grublike, the body thick, soft, and fleshy (carabidoid stage), and it feeds on honey. At the next molt the insect is motionless and nearly footless (semipupal stage). It then changes to a third larval form, when it resembles the maggot or larva of a bee. It then transforms into a genuine pupa, and finally into the beetle.

Suppressed Metamorphosis. This phenomenon, or direct development, is a curtailment or absolute loss of primitive larval characters, or a forcing back of larval features or structures, until they are either passed through in the embryo before hatching or entirely lost, due to the lapse of heredity. This abbreviated metamorphosis is seen in the Crustacea, as the lobster (q.v.), and more especially in certain shrimps and crabs, which, owing to changed conditions, hatch in the adult form, passing through the nauplius and zœa stages in the embryo. It is also seen in the frogs (see FROG), where the different degrees of metamorphosis are quite plainly due to great differences in the conditions of life. See NIDIFICATION.

Causes of Metamorphosis. These are obscure, but it is plain that the different stages are exaggerated or pronounced periods in the growth of the animal, and that the fundamental causes are the same as those which have initiated and controlled the origin of species. This is plainly seen in aquatic larvæ, the young of forms whose larvæ were originally terrestrial. The numberless contrivances and temporary larval organs, especially seen in dipterous larvæ, are evidently adaptations to the needs of the insect during its temporary aquatic life, these being cast aside when the animals pass to a different medium.

1898); J. W. Folsom, *Entomology* (Philadelphia, 1906); Parker and Haswell, *Text-Book of Zoölogy* (new ed., London, 1910).

METAMORPHOSIS, IN PLANTS. Goethe's doctrine which seeks to establish a relationship between the different organs of a plant by assuming an ideal fundamental organ from which the different leaf organs could be derived. The stem came into consideration only as carrying leaves, and the root was almost entirely disregarded. In its application this ideal leaf form came to mean to most botanists an ordinary foliage leaf, and foliar structures have been in the main presented from this standpoint. For example, the parts of the flower are commonly spoken of as modified or metamorphosed leaves; and when petals or stamens are abnormally replaced by foliage-like structures, they are said to revert to the primitive condition and to prove derivation from leaves by modification. Morphology long ago disproved this idealistic metamorphosis, and it does not regard the occasional replacement of a usual organ by an unusual one as any argument in favor of such a view. Consult Sachs, *History of Botany, 1530-1860*, translated by Garnsey and revised by Balfour (Oxford, 1906).

METAPH'ONY. See ETYMOLOGY, FIGURES OF.

MET'APHOR. (Gk. *μεταφορά*, *metaphora*, a transference). A figure of speech by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being "a lamp unto his feet and a light unto his path." The metaphor is a kind of comparison in which the speaker or writer, casting aside the circumlocution of the ordinary similitude, seeks to attain his end at once by boldly identifying his illustration with the thing illustrated.

MET'APHYSICS (Lat. *metaphysica*, from Gk. *μετὰ τὰ φυσικά*, *meta ta physika*, following the physics, because of the position this subject occupied in Aristotle's collected works). The name given to the science which deals with ultimate reality. Metaphysics or ontology is a term used to designate a branch of philosophy, but much difference of opinion prevails as to the precise character and function of this philosophic discipline and even as to its possibility. Before Kant's time there was a very general tendency to build up theories of the nature of things on the basis of a priori reasoning. Certain metaphysical principles were assumed to be necessary, and the acceptance of these principles led to the deduction of various propositions which were held true of reality as it is in itself, i.e., of reality as it exists without relation to the conditions of our experience. This method of procedure is called dogmatism (q.v.), and the metaphysics thus developed is dogmatic or rationalistic metaphysics. This may be dualistic, as in the case of Descartes, who maintained the radical difference between mind and body as two disparate substances; or it may be qualitatively monistic, as in the case of Leibnitz, who resolved all reality into spiritual monads (spiritualistic or idealistic monadism), and in the case of Hobbes, who supposed that all reality consisted in matter and motion (materialism). Others held that knowledge of reality is not derived from a priori principles, but is obtained only from experience, and that this experience gives us a true view of reality. The type of metaphysics thus developed is called empiricism (q.v.). Still others maintained that, while there

is an ultimate reality, it is inaccessible to human knowledge, which is conditioned by human faculties; these faculties do not present us with the real as it is in itself, but with the results of their own elaboration. Our sensations are not revelatory, but transformative, and the results they give us vary with the varying individuals and their varying pathological conditions. Knowledge is thus only seeming; it is illusory. This view is called skepticism. Kant (q.v.) combined and compromised these different motives, and as a result developed a philosophy which he called criticism and transcendentalism. This was skeptical in that it held that there can be no knowledge of ultimate reality. It was empiristic in that it maintained that all knowledge arises with experience and is true of objects of actual and possible experience. It is dogmatic in that it maintained the a priori character of the principles of this empirical knowledge. These principles are necessary and universal in their application to experience; the reason for this is that there are forms supplied by the mind to its sensations, and these forms are logically prior to experience. This logical priority is their transcendental, because these principles transcend experience in the same way in which any condition transcends what it conditions; the transcendental reaches beyond any actual experience and extends to all possible experience. But while controlling all experience, both actual and possible, these principles are powerless with regard to things in themselves. They are not, therefore, to be treated as if the necessary knowledge they confer were a revelation of things as they are in themselves. This knowledge concerns things only "in so far as they appear to us." The argument whereby Kant tried to establish this limitation of knowledge to experience, actual and possible, and to demonstrate its inability to penetrate beyond experience to the realm of the ultimately real, constitutes the critical feature of his philosophy, giving the key word to the title of his three leading treatises, which are all *Critiques* (*Kritiken*).

These types of metaphysics found in modern philosophy up to and including Kant are therefore dogmatism (in its monistic and dualistic varieties and spiritualistic and materialistic subvarieties of the former), empiricism, skepticism, and critical transcendentalism. Some of Kant's most distinguished followers (Fichte, Schelling, and Hegel) developed his transcendentalism and dropped his criticism. This they were enabled to do by their denial of any meaning to the Kantian conception of things in themselves. We have thus a dogmatic transcendentalism in opposition to critical transcendentalism. Since the great period of this dogmatic transcendentalism, extending for about 40 years, to the end of the third decade of the nineteenth century, the development of metaphysics has resulted in as many types as were presented in pre-Kantian philosophy, in spite of Kant's assurance that he had forever determined the limits of philosophical speculation. Materialism revived about the middle of the century; empiricism reasserted itself and in recent years has advanced to the position designated radical empiricism. (See EMPIRICISM and JAMES, WILLIAM.) Dogmatism has challenged Kant's veto. Skepticism, especially in the form of phenomenalism, has had active supporters. (See COMTE and SPENCER.) Both critical and dogmatic transcendentalism have been vigorously upheld

in the Neo-Kantian and Neo-Hegelian movements. In addition some new forms of metaphysics have appeared on the scene. The new realism has combined various motives more or less allied to those actuating other schools. In voluntarism (q.v.) there has been a significant modification of the older idealism in that for this metaphysics ultimate reality is given the character of will rather than that of intellect. See SCHOPENHAUER; BERGSON; MÜNSTERBERG.

Bibliography. The bibliography of metaphysics is almost coextensive with that of philosophy itself. Consult, for the modern period, the works of Descartes, Spinoza, Leibnitz, Hobbes, Locke, Berkeley, Hume, Kant, Fichte, Schelling, Hegel, Büchner, Comte, Schopenhauer, Lotze, Green, J. and E. Caird, Harris, Royce, Taylor, James, Dewey, Bergson, Russell. Systematic treatises: Paul Deussen, *Elemente der Metaphysik* (Aix-la-Chapelle, 1877; 3d ed., Leipzig, 1902; Eng. trans., London, 1894); R. H. Lotze, "Metaphysik," in his *System der Philosophie*, part ii (Leipzig, 1879; Eng. trans., 2d ed., 2 vols., Oxford, 1884-87); Karl Dietrich, *Grundzüge der Metaphysik* (Freiburg, 1885); B. P. Bowne, *Metaphysics* (2d ed., New York, 1895); G. T. Ladd, *A Theory of Reality* (ib., 1899); F. H. Bradley, *Appearance and Reality* (2d ed., ib., 1902). For a general survey of the field, consult: Friedrich Paulsen, *Introduction to Philosophy*, translated by Frank Thilly (2d Amer. from 3d Ger. ed., New York, 1895); Arnold Külpe, *Introduction to Philosophy* (Eng. trans., London, 1897); Rerouvier, *Histoire et solution des problèmes Métaphysique* (Paris, 1901); J. S. MacKenzie, *Outlines of Metaphysics* (London, 1902); G. S. Fullerton, *A System of Metaphysics* (New York, 1904); Harald Höffding, *Problem of Philosophy* (Eng. trans., ib., 1905); James Lindsay, *Fundamental Problems* (Edinburgh, 1910); William Jerusalem, *Introduction to Philosophy* (Eng. trans., New York, 1910); M. W. Calkins, *Persistent Problems of Philosophy* (3d ed., ib., 1912). See also PHILOSOPHY and the references there given.

MET'APON'TUM, or METAPONTIUM (Lat., from Gk. Μεταπόντιον, *Metapontion*). An ancient city of Magna Græcia, Italy, 24 miles from Tarentum and 14 from Heraclea. It was founded at the instigation of the Sybarites, who wished to check the advance of Tarentum, by Achaean and probably Messenian emigrants, early in the seventh century B.C. To this place the philosopher Pythagoras was said to have retired, and here his tomb was shown. In 415 B.C. we find the inhabitants allies of the Athenians in their invasion of Sicily, and for some time previous the town had evidently been in a condition of constantly increasing prosperity. In the wars waged against Rome by Pyrrhus and Hannibal the Metapontines were hostile to the Imperial city. At the end of the war of Pyrrhus they were subjugated completely by the Romans, but in 212 B.C. succeeded in throwing off the yoke by admitting the Carthaginians. After the withdrawal of the Carthaginians the city was deserted and soon fell into ruin. In the neighborhood of the modern railway station are some remains of ancient temples, and excavation has brought to light some inscriptions and architectural fragments. Consult Lacava, *Topografia e storia di Metaponto* (Naples, 1891).

METASOMATISM, mēt'a-sō'mā-tiz'm. A term used in geology for those processes of chemical reaction that lead to the replacement

of one mineral by another of different composition. The chemical reaction is incident usually to a change of environment whereby the mineral becomes less stable than under its original surroundings. A chemical rearrangement then takes place, or an entirely new compound may be introduced, the nature of which is determined by the special conditions. In any case the process seems to be one of molecular interchange, the old being replaced molecule for molecule by the new compound. The latter may contain some of the elements of the earlier mineral, as in the change of tremolite (an anhydrous silicate of lime and magnesia) to talc (hydrous silicate of magnesia), or it may be wholly different, as is shown in the replacement of calcite by metallic sulphides. The underground waters and the heated waters and vapors given off by igneous rocks during the process of consolidation are effective agencies in metasomatism, which is of great importance in the formation of ore deposits.

METASTASIO, mǎ'tā-stǎ'zē-ô (originally TRAPASSI), PIETRO (1698-1782). A great Italian poet and dramatist. He was born at Rome, Jan. 13, 1698, of humble parents, and gave early evidence of his genius by his boyish improvisations. Gravina, a famous jurisconsult of the day, believing in the youth's genius, took charge of his education and gave his paternal name of Trapassi the Greek form Metastasio. He forbade his wasting his powers in improvisations, gave him severe training in the Greek and Latin classics, and left him an inheritance which Metastasio soon dissipated. In Naples, where he had gone in hopes of a livelihood, he wrote the *Orti Esmeridi* (1721), the performance of which aroused the general enthusiasm, particularly that of the famous singer Marianna Bulgarelli, who had the pleasing youth come to live in her house. His frequent meetings there with the composer Porpora gave him the intimate knowledge of musical composition for which his subsequent dramas, all written to be sung, are remarkable. In 1724 appeared one of his most celebrated dramas, *Didone abbandonata*, which, with *Catone* and *Siroe*, gave the poet a European name. In 1730 Metastasio accepted the post of court poet at Vienna. While there he composed 11 plays, among which are his *Ciro*, *Demofonte*, and *Temistocle*. Among the best of his melodramas are *Clemenza di Tito* (1734) and *Attilio Regolo*, this latter being usually considered his masterpiece. He died at Vienna, April 12, 1782, having continued Zeno's work in raising melodrama from the low state to which it had fallen and given it in many respects its most perfect expression. His themes have a humorous color under a varnish of nobility and his characters possess a recognizable psychology; his expression is simple and harmonious and the skill with which he balanced words and music is unsurpassed. Some of his airs have become part of the permanent stock of Italian folk songs. The sentimentality and artificiality with which he was vigorously charged, especially by the more serious writers of the following generation, are characteristic of the Arcadian atmosphere in which he wrote. His works have been translated into many languages and set to music by celebrated composers, among them Vinci and Caldara, Pergolese and Scarlatti. The best edition of Metastasio is that of Paris (12 vols., 1780), with useful supplements in the *Opere postume* (Vienna, 1795), and in the Florentine

editions of 1820 and 1826. The latest critical edition is that published at Bari, 1914. Consult: Mussafia, *Pietro Metastasio* (Vienna, 1882); Giuseppe Carducci, *Lettere disperse e inedite di Pietro Metastasio* (Bologna, 1883); Masi, "Pietro Metastasio," in his *Parrucche e Sanculotti nel secolo XVIII* (Milan, 1886); Antona-Traversi, *Lettere inedite e disperse di Pietro Metastasio, con un' appendice* (Rome, 1886); O. Tommasini, "Pietro Metastasio e lo svolgimento del melodramma italiano," in his *Scritti di storia e critica* (ib., 1891); Vernon Lee, *Studies of the Eighteenth Century in Italy* (new ed., Chicago, 1908).

METAS'TASIS (Neo-Lat., from Gk. *μετάστασις*, removal, change, from *μεταράται*, *methistānai* to remove, change place, from *μετά*, *meta*, after + *ιστάται*, *histanai*, to place, stand). A change in the seat of a disease from one part of the body to another. Acute infections of the venous channels are most likely to result in metastatic processes in other parts of the body. In thrombosis of the lateral sinuses following mastoiditis, portions of the clot may break off and be carried by the blood stream to the brain, heart, lungs or joints, ending respectively in abscesses, endocarditis or pericarditis, infarction and arthritis. The same series of events may attend septic infection of the uterus. When the blood stream becomes loaded with pus-producing organisms and multiple foci of infection are scattered throughout the body, the condition is known as *pyæmia* (q.v.). The wandering propensity of acute articular rheumatism and its tendency to involve the serous lining of the heart and pericardium are sometimes considered as an illustration of metastasis. This would lend support to the infectious theory of rheumatism and to the belief held by many that there is a focus of infection in the tonsils from which bacteria are carried to the joints and the heart. In mumps (q.v.) metastasis may take place in the ovaries in girls or in the testicles in boys, with resulting ovaritis or orchitis respectively. In cancer metastasis takes place principally through the lymphatics, but it is probable that the blood stream may also be implicated, since the foci are often widely distributed.

META SU'DANS (Lat., dripping cone). A great fountain facing the Coliseum at Rome, said to have been erected by Domitian and completed in 97 A.D. Representations on medals and references in literature, however, seem to indicate that Domitian enlarged a fountain already in existence. Its name was given from its shape, which represented the conical turning post of a Roman circus, and from the way the water flowed out through openings over the cone. Only the partially restored brick interior of the fountain remains.

METATARSALGIA, *mět'ä-tär-säl'jī-ä* (MORTON'S DISEASE). A severe neuralgic pain beginning in the ball of the foot and extending up into the foot and leg. It is caused by pressure upon the nerves running between the distal ends of the metatarsal bones, usually the third and fourth, and is set up either by tight shoes, bony hypertrophy of the distal end of the bones, or weakness of the external arch of the foot. The treatment in extreme cases may require resection of the head of the bone or excision of the superficial branch of the external plantar nerve; but relief may generally be obtained from the wearing of properly fitting shoes and appropriate flat-foot braces. Temporary relief may be had

by injecting the nerve concerned with cocaine or normal saline solution.

MET'ATHE'RIA (Neo-Lat. nom. pl., from Gk. *μετά, meta*, after + *θηρίον, thērion*, dim. of *θήρ, thēr*, wild beast). The order Marsupialia, or marsupial mammals. In the classification of the Mammalia prepared by Huxley (*Proceedings of the Zoölogical Society of London*, 1880) the marsupials were placed in a class Metatheria (compare DIDELPHIA), between the Prototheria, or monotremes, below them, and the Eutheria, or ordinary mammals, above them, and equivalent to both in rank. He enumerated 11 characters in distinguishing the Metatheria and giving it the rank he proposed. Subsequent investigations, however, have shown the invalidity of some of the supposed facts relied upon, and the preponderance of evidence that the marsupials cannot be separated from the higher mammals by any such gap as separates them from the Prototheria. The term "Metatheria" is now retained by several authors as the designation of a section of the subclass Eutheria embracing the marsupials. Gregory employs it as the first of two infraclasses (the second being Eutheria), forming the subclass Theria. Consult Beddard, *Mammalia* (London, 1902), and W. K. Gregory, "The Orders of Mammals," in *Bulletin, American Museum of Natural History*, vol. xxvii (New York, 1910).

METATH'ESIS. See ETYMOLOGY, FIGURES OF.

METAURUS, *mět-ä'rüs* (It. *Metauro*). A small river of central Italy, emptying into the Adriatic, 4 miles south of Fano. It was the scene of the defeat of Hasdrubal, brother of Hannibal, by Caius Nero and Marcus Livius in 207 B.C.

METAXYLEM, *mět'ä-zī'lēm*. A term used in the vascular anatomy of plants. In the development of a xylem strand the group of elements which first appears is called the protoxylem (q.v.), while those which appear later constitute the metaxylem. Protoxylem and metaxylem together constitute the "primary wood," while the xylem produced by the cambium (q.v.) is "secondary wood."

MÉTAYER, *mäh'tä'yä'* (Fr. *métayer*, farmer who tills the land for half the produce). An agricultural tenant who works the land with capital owned by the landlord and pays as rental a fixed proportion of the crop. It may in general be said to be the resource of a community where cultivators are without capital. In the United States such a system of renting land on shares prevails mainly in the South, but as time progresses money rents are substituted more and more for share rents, and this seems to be the natural tendency where the economic position of the tenants improves. The system of *métayage* is still very common in Italy, parts of Austria and Russia, and in Portugal and the West Indies. *Métayage* is a system which possesses marked social advantages but equally marked economic disadvantages. The *métayer* cannot be rack-rented; bad seasons cannot drive him into bankruptcy; the increase in value of produce due to improved means of transportation redound to his advantage as well as to that of the landlord. *Métayage*, therefore, tends to create a class of peasantry who are in large measure independent of the price movements which are so great a source of anxiety to the small farmer who is compelled to make periodic money payments for rent. But, on the other

hand, there is slight inducement for either métayer or landowner to make improvements, since one-half of the resulting increase in product goes to the other party on the division of the crop. Métayage has for this reason tended to perpetuate primitive conditions of agriculture. This evil is, however, not necessarily inherent in the system, since it would be quite possible for landowner and métayer to unite in making improvements, and this practice is not uncommon in France. It is also possible to make an agreement as to a separate return for the capital invested. The economic disadvantages of divided responsibility would still remain, and for this reason métayage can hardly survive in highly advanced economic conditions. Its existence in so large a part of Europe is probably to be explained by the persistency of custom among the agricultural population. See Cruveilhier, *Etude sur le métayage* (Paris, 1894). An excellent account of the system in practice is to be found in Higgs, "Métayage in Western France," in *Economic Journal* (March, 1894). See also articles on "Métayage" in Palgrave, *Dictionary of Political Economy*. The standard works on political economy usually devote some attention to the merits of métayage. Consult Adam Smith, *Wealth of Nations* (London, 1776; new ed., New York, 1904), and J. S. Mill, *Principles of Political Economy* (London, 1848; new ed., New York, 1909).

MET'AZO'A (Neo-Lat. nom. pl., from Gk. *μετά*, *meta*, after + *ζῷον*, *zōon*, animal). The name applied to all the animals above the Protozoa. The animal kingdom is thus subdivided into two divisions, viz., the Protozoa, or one-celled animals, and the Metazoa, or many-celled animals. The latter include all the branches or phyla of the animal kingdom from the sponges (Porifera) to the Vertebrata. Each metazoan, however, develops from a single cell, the egg.

The Metazoa have been defined as "animals in which the ordinary (so-called adult) form of the species has always more than one nucleus, and in which the nuclei are for the most part arranged regularly and with a definite relation to the functional tissues of the animal (so-called 'cellular arrangement'). Special conjugating individuals of the form of ova and spermatozoa are always formed." Metazoa reproduce by ova and spermatozoa. These reproductive products originate by a process of unequal fission from their parent, and may be produced by one or different individuals. When they are both produced by the same individual that individual is said to be *hermaphrodite*. When they are produced by different individuals, that parent giving rise to the egg is called *female* and that producing sperm cells or spermatozoa is called the *male*, and the individuals are said to be unisexual and the species dioecious. In certain forms, probably under given conditions of food or temperature, the ova may develop without being fertilized by a sperm cell, the process being called parthenogenesis (q.v.). Reproduction by ova and spermatozoa is called sexual reproduction, and that by parthenogenesis asexual reproduction. Consult Bourne, *The Coelomate Metazoa* (New York, 1901). See CLASSIFICATION OF ANIMALS.

MET'CALF, WILLARD LEROY (1858-). An American landscape painter. He was born in Lowell, Mass., and was at first apprenticed to a wood engraver. He studied painting under George L. Brown (1876-77), at the

Boston Art School, and in Paris (1883) under Boulanger and Lefebvre. On his return to the United States he established himself in New York. Metcalf came to be recognized as one of the foremost American landscape painters of his day. He was elected a member of the National Institute of Arts and Letters, became one of the "Ten American Painters," and received many medals and prizes. His art is characterized by a delicate restraint and a fine feeling for values and tone. His landscapes have a lyric quality, and though seldom brilliant in execution, are nevertheless satisfying in their quiet appeal. He is represented by "May Pastoral" in the Boston Museum of Fine Arts; "The Family of Birches," National Gallery, Washington; "Twin Birches," Pennsylvania Academy of Fine Arts, Philadelphia; "May Night," Corcoran Gallery, Washington; "Icebound," Art Institute, Chicago; "On the River," Cincinnati Museum; "The Prelude," Worcester Museum; "Unfolding Buds," Detroit Museum.

METCALF, WILLIAM (1838-1909). An American steel manufacturer. Born at Pittsburgh, Pa., he graduated from Rensselaer Polytechnic Institute, Troy, N. Y., in 1858. In 1860-65 he had charge of the manufacture of the heavy Rodman and Dahlgren guns at Fort Pitt foundry, Pittsburgh, where most of the heavy artillery used by the Federal government during the Civil War was made. After 1868 he was engaged continuously in steel manufacturing, and in 1897 he organized the Braeburn Steel Company, of which he was the head until his death. He is credited with having made the first crucible steel in America. In 1881 he served as president of the American Institute of Mining Engineers and in 1893 he held the presidency of the American Society of Civil Engineers. He published *Steel—A Manual for Steel-Users* (1896).

METCALFE, CHARLES THEOPHILUS, BARON (1785-1846). A British statesman, born in Calcutta, India. At an early age he was sent to England, where he was educated in a preparatory school at Bromley, and then at Eton. After holding various other positions he became a member of the Supreme Council of India in 1827, and from 1835 to 1836 was provisional Governor-General. During his short term of office he made certain the freedom of the Indian press. He was next made Lieutenant Governor of the Northwest Provinces, but resigned in 1838 and returned to England. The next year he was sent out as Governor of Jamaica, where he succeeded in bringing about better relations between the planters and the emancipated blacks. In 1842 he returned to England, and the next year was made Governor-General of Canada, where he soon came into conflict with the Executive Council and the Representative Assembly. This Council (or cabinet) had been elected to carry into effect the principles of responsible or parliamentary government. In consequence of his refusal to admit their right to be consulted about official appointments—a cardinal feature of the new system—all the members of the Council save one resigned, and for some time he was without a full Council. His refusal occasioned a prolonged and bitter controversy between the Reform and Conservative leaders. The books and pamphlets published for and against him and his attitude were notably strong and brilliant. In the election of November, 1844, the government received a small majority, and

he was able to fill the vacancies with men of his own views. In 1845 he was created Baron Metcalfe of Fern Hill, but in the same year an incurable disease forced him to return to England, where he died. Metcalfe, who had many admirable personal qualities, had been trained in a political school ill adapted to the demands of Canadian politics. In India and Jamaica his point of view had been that of a benevolent autocrat. He lacked both the temper and the knowledge necessary to apply to a vigorous democracy a principle newly vindicated by long and severe party struggle. Consult Sir J. W. Kaye, *Life and Correspondence of Charles, Lord Metcalfe* (rev. ed., London, 1858).

METCALFE, FREDERICK (1815–85). An English scholar and educator. He graduated at St. John's College, Cambridge, in 1838, and was elected fellow of Lincoln College, Oxford. In 1848 he became head master of Brighton College, and then he returned to Lincoln College, where he became bursar in 1849, subrector in 1851, and Greek lecturer in 1853. In 1844 he published a translation of Prof. W. A. Bekker's *Gallus*, with notes and excursus, considered of great historical value (2d ed., 1853). In 1845 followed his translation of Bekker's *Charicles*, a story similarly illustrative of private life among the ancient Greeks, also with notes and excursus. He published: *The Oxonian in Norway* (1856); *History of German Literature* (1858); *The Oxonian in Iceland* (1861); *The Englishman and the Scandinavian* (1880).

METCALFE, SAMUEL L. (1798–1856). An American physician and scientist. He was born near Winchester, Va., graduated M.D. at Transylvania University in 1823, practiced in New Albany, Ind., and in 1831 went to England. Returning to the United States, he made a geological trip through eastern Tennessee, North Carolina, and Virginia, and then settled in New York City, where he devoted himself to scientific work and contributed to the *Knickerbocker Magazine* over the initial M. In 1835 he again visited England. He is the author of *Narratives of Indian Warfare in the West* (1821); *A New Theory of Terrestrial Magnetism* (1833); *Caloric: Its Mechanical, Chemical, and Vital Agencies in the Phenomena of Nature* (2 vols., 1843; 2d ed., 1859).

METCHNIKOFF, mēch'ni-kōf, ELIE (ILIYA) (1845–1916). A biologist, born in the Province of Kharkov, Russia, May 15, 1845. He was educated at Kharkov and afterward studied at Giessen, at Göttingen, and at Munich. He was appointed to the chair of zoology at Odessa in 1870, but resigned in 1882 to devote himself to private researches. He traveled extensively, especially through the northern Balkan kingdoms and the Volga steppe. In 1884, as the result of work on sponges and polyps, he published an epoch-making memoir on the intracellular digestion of invertebrates, *Untersuchungen über die intracelluläre Verdauung bei wirbellosen Thieren* (1883). He found that the individual cells of sponges took in solid particles of food and digested them in order to provide material for the growth of the young; and he saw the amœba-like eggs of a polyp (*Tubularia*) eat and digest the neighboring follicular cells. He also established the fact that certain wandering amœboid cells attack, ingest, or absorb parts of the body which become either useless or septic and thus harmful to the organism, and even hard objects, as also microbes or disease

germs and the bacteria which have entered a wound. He called these microbe eaters "phagocytes" (q.v.). (*Ueber die Beziehung der Phagocyten zu Milzbrandbacillen*, 1884.) He boldly (1884) threw out the remarkable theory (phagocytosis) that inflammation in the vertebrates is due to the struggle between the white or amœboid corpuscles of the blood and the disease germs within it. This theory, in the hands of Sir Almroth Wright (q.v.) and others, led to vaccinotherapy (q.v.). Metchnikoff went to Paris, becoming a French citizen, and was appointed chef de service in the Pasteur Institute in 1892, and later became subdirector, under Roux. In 1895 he demonstrated that bacteriolysis (Pfeiffer's phenomenon) can take place *in vitro*. (See PFEIFFER, RICHARD.) He paid special attention to the microscopy of syphilis (with Roux and others) and proved that the higher apes can be inoculated with this disease. Attributing many ailments of man and especially the decadence of old age to intestinal putrefaction, he made experiments with the intestinal flora and published *La vieillesse* (1904). He based his theory upon his observation of the therapeutic value of lactic ferments (*Bacillus bulgaricus*), not only as a preventive of, but also as a remedy in, intestinal putrefaction and auto-intoxication, thus bringing bacteriology to the assistance of therapeutics. In this connection he wrote *Quelques remarques sur le lait aigri* (1906). Later he took up the study of typhoid fever. Metchnikoff demonstrated the value of, and the close relation between, studies in the development of the lower animals and physiological and medical studies and practice. In 1908 he was awarded, with Paul Ehrlich, the Nobel prize for medicine. His chief writings, besides those mentioned, include: *Leçons sur la pathologie comparée de l'inflammation* (1892; Eng. trans., *Lectures on the Comparative Pathology of Inflammation*, London, 1893); *L'Immunité dans les maladies infectieuses* (1901; Eng. trans., *Immunity in Infective Diseases*, New York, 1905); *Etude sur la nature humaine: essai de philosophie optimiste* (1903). Three of his lectures were published in English as *The New Hygiene* (Chicago, 1907); and of his *Essais optimistes*, collected in 1907, two have appeared in translation as *The Nature of Man* (New York, 1903, 1908, 1910) and *The Prolongation of Life* (New York, 1908, 1910). Many of his essays which have not been included in this list appeared in *Annales de l'Institut Pasteur* (Paris). He also edited with Sacquépée and others *Médicaments microbiens, etc.* (1909). Consult E. E. Slosson, *Major Prophets of Today* (Boston, 1914).

METELLUS. The name of a Roman family of the plebeian gens Cæcilia, which rose to be one of the first families of the Roman nobility. 1. LUCIUS CÆCILIUS METELLUS, consul in 251 B.C., victor, at Panormus, over Hasdrubal, 1 (q.v.). A tradition, questioned now, said that, in 241, when the temple of Vesta was burned, he brought out the Palladium safely, though he was himself blinded by the flames. Consult J. B. Mayor on Juvenal, 3, 139.—2. One of the most distinguished members of the family was QUINTUS CÆCILIUS METELLUS MACEDONICUS, who received his surname from his victory over Andriscus, a claimant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers an example of the greatest felicity. He died 115 B.C.—3. QUINTUS CÆ-

CILIUS METELLUS NUMIDICUS twice defeated Jugurtha in Numidia (108 B.C.), but was superseded in his command by Marius. When Saturninus caused a law to be passed requiring all senators to swear within five days to uphold his agrarian law, Metellus refused and went to Asia into exile. He returned later and died in Rome (c.91 B.C.). He was celebrated for his integrity. 4. His son, QUINTUS CÆCILIUS METELLUS, surnamed PIUS for his efforts to effect the recall of his father from exile, joined Sulla in 83 B.C., but sought to moderate the severity of his proscriptions. He fought with success for Sulla against Marius and served acceptably in Spain. He, too, bore a distinguished character for virtue.—5. QUINTUS CÆCILIUS METELLUS CRETICUS conquered Crete and reduced it to a Roman province (67 B.C.).—6. QUINTUS CÆCILIUS METELLUS PIUS SCIPIO, sometimes called QUINTUS SCIPIO and sometimes SCIPIO METELLUS, was a son of Publius Cornelius Scipio, who was adopted by one of the Metelli and became the father-in-law of Pompey (52 B.C.) and his zealous partisan. He commanded under him at Pharsalus, maintained war on his behalf for some time in Africa, and after the battle of Thapsus (46 B.C.) died by his own hand. Consult: M. Wende, *De Cæciliis Metellis* (Bonn, 1875); the article "Cæcilius," by F. Münzer, in Pauly-Wissowa, *Real-Encyclopädie der klassischen Altertumswissenschaft*, vol. iii (Stuttgart, 1897); and the article "Cæcilius" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

METEMPSYCHOSIS (Lat., from Gk. μετεμψύχωσις, from μετεμψύχων, *metempsychoun*, to make the soul pass from one body to another, from μέτα, *meta*, over + ἐμψύχων, *empsychoun*, to animate, from ἐμψυχός, *empsychos*, animate, from ἐν, *en*, in + ψυχή, *psychē*, soul). Transmigration of souls, or, more accurately, the reincorporation of a soul. In a crude form this is a frequent belief of primitive forms of religion, and is not a religious but a philosophical opinion. That is to say, it is not believed that any religious factors, such as the state of the soul or the will of the deity, decide the soul's fate, but that every soul necessarily finds another habitation after death. Dreams showed that souls might leave their bodies and travel to distant places, and also that souls of the dead still lived. Moreover, if men had souls, so had animals and even trees, for they also possessed life; and the next step was a belief in the transference of souls from one to another. This helped to answer the questions whence came souls at birth and whither do they go after death? As any soul during a man's life may enter at will the body of a beast, so after death the soul of the departed may find shelter either in a man's body or in the frame of a beast. Some savages believe that at the instant when one dies one's soul enters a new body. Others believe that the spirit can remain for some time disembodied, and that it seeks reincarnation, not from necessity, but for pleasure. The Australians believe that souls lurk beside the paths and select their future mothers from the women who pass. In some of the tribes of American Indians resemblances of children to persons recently dead, or even to animals, are used as proofs of the identity of their souls. Sometimes this animistic belief appears sporadically in a much more developed environment and is evidently a reversion. Thus, in the midst of the

nature gods of the Teutons we find once in legend and often in folklore a reversion to the belief that men are often liable to be reborn on earth either in human or in animal bodies. Sometimes no rebirth is necessary, but the soul leaps from one body and drives out the soul of the animal whose body it enters. All these beliefs, more or less confused and vague, but persistent through various stages of social development, are found in Europe, India, Asia, and America, while in Africa and in Polynesia, where very little social change has taken place, it may be said to be in its crudest form the usual faith of the people.

While common in primitive, animistic religions, metempsychosis has also been a part of certain advanced religious systems. It was formerly supposed, on the basis of statements of Herodotus, to be found in Egypt, but a more complete knowledge of the Egyptian religion fails to reveal it. The Indian and Greek religions took it up into philosophical systems. Of these the Hindu makes far the most of it. In the earliest Vedic hymns there is no mention of it. In the Upanishads it appears, perhaps borrowed from the aboriginal inhabitants of India. From then on it became a part of the moral structure of Hinduism, as the great means by which Karma (q.v.) operates. It is the way of final salvation. The soul, which is blind and ignorant, will be reborn again and again until at last, after innumerable incarnations, it shall arrive at truth. Then it will know itself to be the absolute, Karma will cease, and rebirth will be ended. It is also used to punish evil and reward good: The soul is doomed to expiate by future rebirths in low forms of life the sins committed in this life. On the other hand, a highly moral life results in one being reborn in a higher caste, as an aristocrat, a king, or a priest, or even as a godling. In this system the length of the series of rebirths depends wholly upon the individual, who works out his own salvation by his own acts. As Buddhism denies the existence of a soul, metempsychosis in India, strictly speaking, is confined to Hinduism. But Buddhism had an analogous belief in the transmigration of character entities, also conditioned by acts, ending in Nirvana, unconscious existence or extinction of personality resulting from extinction of desire and volition. The system was one of transmigration, without any souls to transmigrate. The new personality was the result of the Karma of the old, and all the moral values of the Hindu doctrine were preserved. In Mahayana, or Northern Buddhism, much stress is laid upon the incarnation of the Bodhisattvas, or future Buddhas. The first known appearance of the belief in Greece is in the system of Pythagoras. Herodotus says that he borrowed it from the Egyptians (ii, 123), but there is no present evidence that the Egyptians had such a belief. It has often been surmised that in his travels Pythagoras came in contact with the Indian belief, but there is no need for such a supposition. Indirect influence of Indian thought would not be impossible, but with the widespread ideas of the soul in primitive religion it is not necessary to go far from Greece itself in search of the suggestions on which he built. The belief may be connected with Orphic conceptions of the guilt of the soul. Pythagoras held that the soul was a being cast down to earth because of sin and imprisoned in various bodies till, by means partly magical and partly

ethical, it has worked out its purification, when it returns to its former happy abode. Tradition ascribes to Pythagoras the claim to remember former states. Plato, in the *Republic*, the *Phædrus*, and the *Phædo*, has the same idea of the soul as a fallen spirit, which must work out its own redemption by three times, in three millenniums, making choice of the philosophic life, after which it ascends to its home with the gods. Whether this picture presents Plato's serious belief, or is used as poetic allegory, it is difficult to say. In Neoplatonism, however, it is a part of the philosophical system, and, as in the Hindu system, the soul is a part of the absolute itself. Some of the Gnostics (q.v.) were said to hold to transmigration of souls. The Christian Church almost universally repudiated it, even Origen, who believed in the preëxistence of the soul, rejecting it. It has appeared in the Jewish Cabbala, in the Shiite sect of the Moslems, in the religion of the Druses, and in Babism. In Europe it has occurred sporadically. Leibnitz held a theory akin to the Buddhist Karma, and Lessing consciously adopted metempsychosis. In the present day theosophy is attempting to introduce it into the West, along with other elements of Indian thought. See KARMA.

METENTERON, mêt-ên'têr-ôn. See ALIMEN-TARY SYSTEM.

ME'TEOR (OF. *meteore*, Fr. *météore*, from Gk. *μετέωρον*, *metēōron*, meteor, from *μετέωρος*, *metēōros*, on high, from *μετά*, *meta*, beyond + *αἰεῖν*, *aieîn*, to lift), FIREBALL, BOLIDE, or SHOOTING STAR. A term applied to those swift-moving points of light which flash out suddenly and dart across the sky along paths which are usually straight and often many miles in length. At one time it was believed that their luminosity was excited by terrestrial magnetism, but it is now generally accepted that they are small solid bodies which enter our atmosphere from outside space and are raised to incandescence by the friction caused by their rapid motion through the air. They frequently rival Venus, and even the moon, in brightness. It is difficult to determine their exact size, but, from the light which they emit, it has been estimated that ordinary shooting stars are extremely small, weighing only a few ounces at most, while Humboldt was of opinion that the diameters of the largest fireballs varied from 500 to 2800 feet. In many cases a long comet-like train of light is left behind. One or two instances are on record where the train of a fireball continued shining for half an hour after the body had disappeared. The cause of this remarkable phenomenon is still obscure, though Professor Trowbridge, of Columbia University, has advanced the interesting theory that it is due to the phosphorescence of the rarefied air along the path of the meteor. The heights at which meteors appear average

about 75 miles, and their velocities range from 10 to 40 miles per second. In a narrow sense meteors are those shooting stars which flash into view without detonation or explosion and appear to be completely consumed during their flight through the atmosphere; they are sometimes called bolides. As thus characterized they form a class of bodies distinct from the meteorites (see METEORITE).

One of the most remarkable facts connected with shooting stars is that certain appearances of them are *periodic*. On most occasions they are *sporadic*, i.e., they appear singly, and traverse the sky in all directions. At other times they appear in swarms of thousands, and these swarms are periodic, or recur on the same days of the year. Attention was first directed to this fact on occasion of the prodigious swarm which appeared in North America between Nov. 12 and 13, 1833, described by Professor Olmsted, of New Haven. The stars fell on this occasion like flakes of snow, to the number, as was estimated, of 240,000, in the space of nine hours, varying in size from a moving point or phosphorescent line to globes of the moon's diameter. The most important observation made was that they all appeared to proceed from the same quarter of the heavens, the vicinity, viz., of the star γ , in the constellation Leo; and although that star had changed greatly its height and direction during the time that the phenomenon lasted, they continued to issue from the same point. It was afterward computed by Encke that this point was the very point towards which the earth was moving in her orbit at the time. Attention being directed to recorded appearances of the same kind, it was observed with surprise that several of the most remarkable had occurred on the same day of November, especially that seen by Humboldt and Bonpland at Cumana in 1799 and by other observers over a great extent of the earth. The November stream was again observed in the United States in 1834, between November 13 and 14, though less intense.

Olmsted showed that the emanation of the shower of meteors from a fixed point, or "radiant," as it is called, could be explained by supposing them to have been derived from a cloud of particles moving round the sun in an elliptic orbit which intersects that of the earth at the point at which the latter finds itself in November. Those which are rendered visible when they strike our atmosphere travel along lines which are practically parallel, and the apparent divergence of their paths is due to the fact that what the eye notes is the projection of the true path on the face of the sky. The variable character of the shower at its annual appearances was later elucidated by Olbers, who substituted for Olmsted's cosmical cloud a closed ring of irregularly distributed particles revolving round the sun in such a way that the densest part of the swarm crosses the earth's orbit once in 33 or 34 years, and he even went so far as to predict that the next notable display would occur in 1867. In 1864 Professor Newton, of Yale, took up the investigation of the recurrence of the November meteors, or Leonids, as they are now called from the position of their radiant, and he concluded that there were five possible periods for the meteor ring—33½ years, 376 days, 354 days, 188 days, and 177 days. In consequence, he was able to predict the occurrence of another striking display of

meteors on Nov. 13-14, 1866, a prediction which was fulfilled with remarkable punctuality. His work was supplemented by the English astronomer Adams, who showed that, of the periods suggested by Newton, the 33¼-year period was the only one consistent with known facts.

There are many other periodic showers. One of particular interest is the shower of Perseids, which occurs between August 10 and 12 and has its radiant in the constellation Perseus. It is noticed in ancient legends as the "fiery tears" of St. Lawrence, whose festival falls on August 10. The principal meteor showers, with the dates of their occurrence, are given below:

Quadrantids	January 2-3
Lyrids	April 20-22
♌Aquariids	May 1-6
♈Aquariids	July 28
Perseids	August 10-12
Orionids	October 18-20
Leonids	November 14-16
Andromedids	November 17-23
Geminids	December 10-12

It is now generally accepted that the periodic meteors are the débris of comets which have been captured by the members of the solar system. It is supposed that the matter composing the tail has been driven off into space, while that of the nucleus has been scattered along the orbit by the disintegrating forces to which it has been subjected. In some cases this disintegration is apparently complete, while in others it is still going on. This view was first definitely propounded by Schiaparelli in 1866, though the division of Biela's comet (q.v.) into two parts had led Kirkwood to practically the same conclusion in 1861. Schiaparelli drew attention to the fact that the Perseids move in the same orbit as Tuttle's comet of 1862, while early in 1867 Leverrier identified the orbit of the Leonids with that of Tempel's comet of 1866 and even assigned 126 A.D. as the year in which this comet was brought into its present orbit by the attraction of Uranus, and Weiss proved that the Andromedid meteors of November 28 were all that remained of Biela's lost comet, which was last seen in 1852. In all about 80 meteor streams have been assigned more or less certainly to known cometary orbits.

METEORIC DUST. See DUST.

METEORIC HYPOTHESIS. See COSMOGONY.

METEORIC STONE. See METEORITE.

METEORITE, AÉROLITE, METEORIC STONE, URANOLITE, or SIDERITE. A solid body reaching the earth from unknown points beyond the earth's atmosphere. When seen at night meteorites usually consist of a luminous head or fireball, followed by a bright train of incandescent matter. Sometimes there are visible explosions, and even loud detonations are occasionally heard. In the daytime the light of both fireball and train is largely lost against the sky background; it is said, however, that visible clouds at all times replace the luminous train.

There are numerous records and stories in all ages and countries of the fall of stones from the sky, but until comparatively recent times they were treated by scientific men as instances of popular credulity and superstition. It was not till the beginning of the nineteenth century that the fact was established beyond a doubt. According to Livy, a shower of stones fell on

the Alban mount, not far from Rome, about 654 B.C. The fall of a great stone at Ægospotami, about 467 B.C., is recorded in the *Parian Chronicle* (see ARUNDEL MARBLES) and by Plutarch and Pliny. It was still shown in the days of Pliny (died 79 A.D.), who describes it as the size of a wagon and of a burned color. In the year 1492 A.D. a ponderous stone weighing 260 pounds fell from the sky near the village of Ensheim in Alsace; part of it is still to be seen in the village church. An extraordinary shower of stones fell near Laigle in Normandy, on April 26, 1803. The celebrated French physicist, M. Biot, was deputed by the government to repair to the spot and collect the authentic facts, and since the date of his report the reality of such occurrences has no longer been questioned. Nearly all the inhabitants of a large district had seen the cloud, heard the noises, and observed the stones fall. Within an elliptical area of 7 miles by 3 the number of stones that had fallen could not be less than two or three thousand; the largest were 17 pounds in weight. These are only a few out of hundreds of instances on record.

As is natural with objects of such mysterious origin, meteoric stones have always been regarded with religious veneration. At Emesa in Syria the sun was worshiped under the form of a black stone, reported to have fallen from heaven. The holy Kaaba of Mecca and the great stone of the pyramid of Cholula in Mexico both have a similar history. The existence of such bodies once admitted led to assigning a meteoric character to strange ferruginous masses found in different countries, which had no history or were only adverted to in vague tradition. Of this kind is the immense mass seen by Pallas in Siberia, now in the Imperial Museum in St. Petersburg. The largest aërolite known is probably the immense mass called Ahnighito (the Tent), which was discovered by Lieutenant Peary, in 1894, near Melville Bay, 30 miles east of Cape York in northern Greenland. With it were two smaller ones, known respectively as "the Woman" and "the Dog." The three masses had long been used by the Eskimo as a source of iron for the manufacture of knives and other weapons, and were supposed to have been hurled from the heavens by the evil spirits. The dimensions of Ahnighito are as follows: length, 11½ feet; width, 7½ feet; thickness, 3½ feet. Its weight is 37½ tons. It was brought to New York with its two companions in 1897, and since 1904 has rested under the entrance arch of the Museum of Natural History. Its nearest rival is Bacubirito, a huge mass discovered half buried in the ground near the old mining town of Bacubirito in the State of Sinaloa, Mexico. Its weight is said to be 51 tons, but as the mass has never been raised from the place where it originally fell, no correct measurements of its dimensions have been possible, and its weight has doubtless been overestimated.

One constant characteristic of meteoric stones is the fused black crust, like varnish, with which the surface is coated. This coat is very thin and is separated from the inner mass by a sharply defined line. It is due to the action of heat generated by the rapid motion of the meteor through the atmosphere. The specific gravity of meteoric stones ranges from two to seven or eight times that of water. Chemically they have the same composition as our earth, the chief constituent being nickel iron, which

occurs in variable proportions. No new element has been found in them, and only about 30 of those already known. But these old elements are often combined in the form of minerals not yet known on the earth.

Besides these solid masses of considerable size numerous instances are on record of showers of meteoric dust over large tracts of land. See DUST.

It remains to notice briefly the various opinions that have been advanced as to the origin of meteorites. It might be supposed that they are simply meteors which are so large that they are not completely consumed in their rapid passage through the atmosphere, but they differ from meteors in one important respect. They are invariably sporadic; no meteorite is known with certainty to have been a member of any meteoric shower, though there are at least two instances on record where a meteorite fell during such a shower. The hypotheses that have been formed in answer to the question, Whence come those solid masses that fall upon the earth? are of two kinds, some ascribing to them a telluric origin and others making them alien to the earth. Of the first kind is the conjecture that they may be stones ejected from terrestrial volcanoes, revolving for a time along with the earth and at last returning to it. It is difficult, however, to imagine that the velocity requisite to carry them beyond the limits of the earth's atmosphere and prevent their immediate return could have been imparted by any terrestrial eruption, for there is no reason to suppose that the eruptions of the past have differed in violence to any great degree from those of the

meteoric stones the original velocity of projection must be no less than 40 or 50 times that of a cannon ball, which makes the hypothesis improbable. Another and perhaps more plausible hypothesis is that which considers them to be minute members of the solar system, similar to the planetoids, which are captured from time to time by the earth. Consult: S. Mennier, "Les météorites," in *Encyclopédie chimique*, vol. ii (Paris, 1884); E. W. Cohen, *Meteoritenkunde* (Stuttgart, 1894-1905); Lazarus Fletcher, *Introduction to the Study of Meteorites* (London, 1904).

METEOROLOGICAL SOCIETY, THE ROYAL. A learned association, established in 1850, incorporated in 1866, and allowed to adopt the prefix "Royal" in 1883. The society has its headquarters in London. The objects are the promotion of meteorology in all its branches and the recording of data and theories relating to the subject. Its membership consists of fellows and honorary members, the latter being foreigners of distinction. The publication of the society is the *Quarterly Journal*. During the session 1913-14, 18 papers were read and were afterward printed in the *Quarterly Journal*. The society meets on the third Wednesday in each month from November to April, and the annual meeting takes place in January. The president in 1914 was C. J. P. Carl, and the secretaries Francis Campbell Bayard and W. F. Caborne.

METEOROL'OGY (Gk. *μετεωρολογία*, *meteōrologia*, treatise on celestial phenomena, from *μετεωρολόγος*, *meteōrologos*, discussing celestial phenomena, from *μετέωρον*, *meteōron*, meteor +

WEATHER MAP, FEB. 5, 1915, 8 A.M.

present day. In seeking a source beyond the earth the moon readily presents itself. Olbers was the first to investigate (1795) the initial velocity necessary to bring to the earth masses projected from the moon. He showed that to account for the actual measured velocity of

λέγειν, *legein*, to say). The study of the atmosphere and its phenomena. Efforts are being made by every civilized nation to apply to the benefit of mankind the knowledge we possess of meteorology, especially to foretell the winds and weather from day to day and the general

character of the seasons from season to season. About 50 official governmental weather bureaus receive reports from their stations by telegraph daily, compile weather maps, issue forecasts, and publish weekly, monthly, or annual climatological summaries, together with frequent special meteorological memoirs. Among the most prominent of these, on account of the extent of their territory and the value of their publications, are those of Austria-Hungary, Great Britain, France, Germany, Italy, Russia, India, Argentine Republic, Canada, and the United States. The total annual expenditure by all government services on meteorological work is not less than \$3,000,000, to which should be added an equal sum to represent the great amount of work that is done without pay by voluntary observers. Several private meteorological establishments have been founded by wealthy lovers of science, most prominent among which are those

In addition to its material progress in observers and apparatus, theoretical meteorology has especially profited by the labors of eminent physicists. Those who have, since 1850, contributed most to our knowledge of the mechanics and physics of the atmosphere may be enumerated as follows: Adolph Erman, who published in 1868 a memoir on the distribution of winds and pressure over the globe; J. C. Redfield, who showed the mechanism of extended hurricanes; James P. Espy, who published several reports and a volume on the philosophy of storms, explaining in general how atmospheric moisture, by its condensation into cloud and rain, disturbs the equilibrium of the atmosphere and produces both local and general storms; William Ferrel, who published numerous papers developing the laws of the motions of the earth's atmosphere and its general and local phenomena as resulting from the rotation of the earth on its axis,

WEATHER MAP, FEB. 6, 1915, 8 A.M.

of Vallot, on Mont Blanc; A. Lawrence Rotch at Blue Hill, near Boston (since his death (1912) the property of Harvard University); L. Teisserenc de Bort at Trappes, near Paris. There are also numerous municipal observatories, prominent among which are that of the New York City Central Park, Dr. Daniel Draper, director, and those of Montsouris and the Tour St. Jacques in Paris, of which Dr. J. Joubert is director. Observatories are also maintained by special associations, such as those on the Santis, Austria, the Jesuit observatories of St. Helier, Havana, Zikawei, and Manila. Special mention should be made of Symons's British Rainfall System, to the development of which his life was devoted and the perpetuity of which is now assured by the terms of his will. Over 300 stations are maintained in the British Isles. Organized systems of rainfall stations have also been maintained in Mauritius, Jamaica, Barbados, Antigua, and St. Kitts.

the evaporation and condensation of aqueous vapor, and the general influence of the solar heat; Lord Kelvin, who first gave the laws of thermal convective equilibrium for dry air; Pleslin, who gave the laws of thermal equilibrium for moist air; Von Helmholtz, Willy Wien, Oberbeck, Guldberg and Mohn, Margules, Diro Kitao, Rayleigh, Pockels, Sprung, V. Bjerknes, and J. W. Sandström have made important contributions to the hydrodynamic problems of the atmosphere; Prof. H. Hertz, W. von Bezold, and Marcel Brillouin have contributed greatly to the perfection of our knowledge of the thermodynamic problems. Noteworthy contributions in this field include that of Pockels, on the theory of the formation of rain in slowly ascending currents of moist air (see *Wiedemann's Annalen*, January, 1901); Prof. F. H. Bigelow's tables in his reports on international cloud work (Washington, 1900); his report on barometry (Washington, 1902); Neuhoff's memoir on adiabatic changes in the atmosphere (Ber-

lin, 1900); Berson and Assmann's *Scientific Balloon Ascensions* (3 vols., 4to, Berlin, 1900); Bjerknes and Sandström, *Dynamic Meteorology and Hydrology* (2 vols., 4to, so far, Washington, D. C., 1910, 1913).

Our knowledge of meteorological conditions has been obtained for the most part by observation of the clouds or by stations on mountain tops. More recently it has been found desirable to study conditions at considerable altitudes above stations and places. In order to obtain better data for the lower atmosphere, at least partially to meet the needs of the case, Americans and Europeans have developed the art of obtaining meteorographic records by sending up meteorographs on kites to heights of 1 or 2 miles; on the other hand, Europeans have given special attention to the development of the balloon and especially the small sounding balloon which can carry a meteorograph to an elevation of 7 or 15 miles above sea level, where man cannot live. The exposure of meteorological apparatus so that the records from different stations on the earth's surface and from vessels on the ocean and from kites or balloons in the atmosphere shall be comparable with each other offers many difficult problems, but the progress towards uniformity throughout the world has been appreciable during the past 40 years. Every first-class weather service now keeps close watch of the condition of its apparatus and the correctness of the methods in vogue at its stations. Although much remains to be done, yet the contrast between the condition of affairs in 1850 and that in 1915 is very great.

In some cases the larger portion of the funds and forces of a weather service is spent upon observations and climatological work, but in most cases the daily forecast work takes precedence, since that promises immediate results in saving life and property. In order to carry on this work properly numerous stations must be connected by telegraph with the central bureau, at which several simultaneous observations must be received daily from the observers, and weather charts must be promptly made out showing the isobars, isotherms, state of the wind and weather, moisture, and clouds over a large region of country. The accompanying charts, for February 5, 8 A.M., and February 6, 8 A.M., 1915, show the general character of such daily weather maps; they will easily be understood by studying the respective legends. On these charts the reader will see the development of a storm that began with an area of low pressure in Kansas and rapidly developed into the great storm centre shown on the second chart; the storm then passed northeastward over the Lake Region and the Gulf of St. Lawrence and was followed by an extensive area of clear cool weather on February 7. The movements and changes of storms and weather will undoubtedly be fully understood only in proportion as we have better knowledge of the facts and of the mechanical and physical laws that govern the atmosphere, but their approximate prediction from day to day is expected and demanded by reason of the many interests that depend upon the wind, temperature, and weather. At present such forecasts are generally based on the evident trend of events, as shown by comparing the two or three latest weather maps, and in part also on empirical rules or generalizations, based on the study of similar types of maps in preceding years; but in some cases also one may be guided

in part by general physical principles that must apply to the case in hand. The generalizations relative to storm movements for the United States, i.e., the statistics of storms, have been presented in three memoirs by Prof. Elias Loomis and printed in the *Memoirs of the National Academy of Sciences*. These were supplemented in 1914 by E. A. Bowie in *Monthly Weather Review, Supplement No. 1*. Similar data for the Northern Hemisphere as a whole were published in 1893 in *Bulletin A* of the United States Weather Bureau; this compilation is mostly the work of Prof. E. B. Garriott and is based upon 10 years of daily maps (1878 to 1887), originally published in the *Bulletin of International Simultaneous Observations*. In this volume the paths of the storm centres are classified by different types and displayed on charts that show the frequency with which storm centres pass over each square of latitude and longitude.

Charts of storm paths for Europe, Asia, and Japan have been published by Germany, Russia, and Japan respectively, and monthly charts for the United States have been published regularly since January, 1873. By means of these charts one may, in a general way, anticipate the path and velocity of a storm centre when once it has appeared in any part of the Northern Hemisphere. In the Northern Hemisphere such centres move westward when they lie between the equator and the parallels of 25° or 30° N.; they then curve poleward and move northeastward with increasing rapidity towards the parallel of 60° or 70°. The variations from this general rule can best be understood by studying the charts of storm frequency. A similar rule holds good for the Southern Hemisphere, substituting only south for north. But little is known about the tracks of storms within the Arctic circle. The known region of greatest storm frequency extends in a narrow belt east and west from Lake Superior to Newfoundland and its prolongation eastward ends in the interior of northern Russia. The region of next greatest storm frequency covers the islands of Japan. The north polar region of cold air, whose tendency is to flow outward towards the equator, is inclosed within an oval curve extending from Luzon over Japan, southern Alaska, British Columbia, the region of the Great Lakes, Newfoundland, the Hebrides, northern Norway and Sweden, and ending in Siberia at lat. 60° and long. 90° east of Greenwich. South of this oval the prevailing winds are west and southwest; north of it they are north and east in the stormy season of the year.

The great whirls that we call general storms occur in connection with these polar and equatorial currents, but not necessarily between them. The whirls are explained as partially due to mechanical reactions between the northern and southern currents, but they are not merely hydrodynamic phenomena, since they have also an additional thermodynamic relationship which is quite as important. The warm, moist southerly winds are underdriven by the colder and drier northerly winds. This enforced elevation of the southerly winds is accompanied by a corresponding expansion and cooling of the air that is thus elevated, and generally it is soon cooled to its dew point or below. This is followed by condensation of aqueous vapor and the formation of cloud, rain, hail, or snow with a great liberation of latent heat. Consequently

the cloudy region will be warmer, but especially will it have a much smaller specific gravity than before.

In very small storms, such as tornadoes, waterspouts, etc., this process gives rise to very rapid uprising currents, a very rapid whirl around the central axis, and a very low barometric pressure at the centre, but in extensive storms the vertical current is not so conspicuous, although the buoyancy of the central air tends very strongly to maintain the disturbance. The storm centre undoubtedly has a tendency to move towards the region in which the temperature and buoyancy are most disturbed; but as this region is always moving in advance, the storm centre will remain in the rear and its path will advance somewhat to the left of the direction of the greatest disturbance. But the up-lifting of the lower moist air may be greatly intensified if the southerly winds on the eastern half of the storm area are being pushed up over high lands, or it may be almost wholly annulled if these winds must necessarily descend from the high lands to the ocean level. Therefore the relation of the storm's motion to the continents must be carefully worked out.

As regards weather prediction, it is evident at once that the descending winds and those that are coming from the north southward are being warmed up, and therefore in their presence the storm disappears and the weather clears away. For the Atlantic coast of North America rain is to be forecast only when a south and east wind prevails, and especially when it is blowing on the coast. The actual effect of mountains, plateaus, continents, and the underflow of cold air varies so much on every occasion that the best one can do in forecasting is to familiarize himself thoroughly with the illustrations and exceptions that appear on every daily weather map.

The atmosphere would be at rest on the earth's surface and whirl about with the globe were it not for the sun's heat. All the important meteorological phenomena may be considered as resulting from the interaction of the solar heat, the moisture in the air, the varying temperature, and the centrifugal reaction due to the rapid diurnal rotation of the earth on its axis. The solar radiation maintains the temperature of the equatorial regions. The cold air of the polar region is both by gravity and by centrifugal force driven towards the equator. Thus the general currents are maintained moving from the poles towards the tropics and return. They are most intense in the Northern Hemisphere in January, when the sun is farthest south or over the tropic of Capricorn, because at that time and subsequently the difference of temperature between the equator and the North Pole is greatest, and the reverse holds good in June, when the sun is north of the equator. The general circulation is greatly modified by the difference in temperature and moisture of the air over the land and the ocean, so that in summer time the tendency of the air to flow inward towards a continent or mountain is very decided. The general circulation is also greatly modified by the presence of snow, ice, mountains, plateaus, clouds, forest, etc. The winds, when once formed by differences of temperature and moisture, are themselves affected by the rotation of the earth. No matter in what direction they may be moving they are at once deflected from their polar path; in the

Northern Hemisphere they turn to the right; in the Southern Hemisphere to the left. Therefore those flowing towards the equator become the northeast and southeast trade winds and those flowing towards the poles, or the upper return trade winds, become the westerly winds of the north and south temperate zones.

The differences in temperature between the continents and the ocean give rise to the so-called monsoon winds. The general centrifugal action of the winds produces a low pressure in the regions about which the winds rotate, viz., a low pressure in the Arctic and Antarctic regions; a low pressure on the left of the winds blowing around a storm centre and on the right-hand side of these same winds considered as blowing around an adjacent region of high pressure; a low pressure at the equator between the northeast and southeast trades. The reaction of the easterly winds near the equator and the westerly winds farther north also produces a similar area of high pressure between these two systems of wind corresponding to the high pressure under the tropics of Cancer and Capricorn.

A full exposition on these and other theorems by Prof. William Ferrel will be found in his *Treatise on the Winds* (New York, 1893). The results of later researches are presented in Prof. F. H. Bigelow's report on international cloud observations (Washington, 1900) and his report on barometry (Washington, 1902), but these are written for purely technical and mathematical readers. A general resumé of the laws of atmospheric motion is given in the appendix to Hann, *Lehrbuch der Meteorologie* (3d ed., Leipzig, 1914). An elementary presentation of the subject will be found in Davis, *Elementary Meteorology* (Boston, 1894); in Ward, *Practical Exercises in Elementary Meteorology* (Boston, 1899); Moore, *Descriptive Meteorology* (New York, 1910); and in Milham, *Meteorology* (New York, 1912). Consult Flammarion, *Thunder and Lightning* (Boston, 1906). For history of practical meteorology in the United States, see WEATHER BUREAU.

Some details as to the instruments used in meteorology will be found under the topics: ACTINOMETER; ANEMOMETER; BAROMETER; PYRHELIOMETER; NEPHOSCOPE; RAIN GAUGE; THERMOMETER. Some of the results of observation will be found treated under the topics: ATMOSPHERE; ATMOSPHERIC ELECTRICITY; AURORA BOREALIS; BLIZZARD; CLIMATE; CLOUD; DARK DAY; DEW; DOLDRUMS; DUST; EQUINOCTIAL STORM; FOG; FROST; HAIL; HALO; HUMIDITY; INDIAN SUMMER; ISOBAROMETRIC LINES; ISOTHERMAL LINES; LIGHTNING; MONSOON; POLARIZATION OF SKYLIGHT; SCINTILLATION; SIMOOM; SNOW; SNOW LINE; STORM; HEAT; TERRESTRIAL ELECTRICITY; TYPHOON; WEATHER; WHIRLWIND; WIND.

METEOROLOGY, MARINE. Information as to the kind of weather which may be expected at sea at different times and in different localities and a knowledge of the best means of avoiding or minimizing the effect of unfavorable conditions are of the utmost importance to the maritime world in order that ships may be able to navigate more safely and economically and with the greatest possible ease and comfort. The subject has attracted more or less attention for thousands of years, for storms on the water are greatly to be feared by all who traverse the sea in any except the very large vessels of recent times and are to be avoided if practicable

even by these. The first systematic and practical attempts to collect, consider, and publish definite, correct, and useful meteorological and oceanographic information were made by Lieutenant (afterward Commander) Matthew F. Maury (q.v.) of the United States navy; and the United States Naval Hydrographic Office, which Maury founded, to-day supplies to the mariner more information of this character

of taking and recording observations and developing the results for use.

Air conditions include temperature, pressure, hygrometric state, and their results, such as freezing, rain, snow, hail, fog, mist, air movements, and calms. The tendency of air conditions at sea is the same as on land, but the results are somewhat different, owing to comparatively stable (i.e., slowly changing and

AVERAGE STORM TRACK IN SOUTHERN HEMISPHERE (SOUTH PACIFIC).

than he can obtain from any other source, possibly from all other sources combined. The general subject of meteorology is so fully treated in the foregoing pages and elsewhere under its various branches (see references at the end of this article and the preceding) that only the general nautical features will be considered under this head.

Practical marine meteorology may be divided into a study of (a) air conditions, (b) air movements, (c) instruments used aboard ships for ascertaining air conditions and the methods

through moderate ranges of temperature) water temperatures and the unobstructed sweep of air movements, while on land the temperature of the surface may change rapidly and the irregular character of its elevations greatly modifies the force and direction of air currents. Aside from air movements the most important results of air conditions are fog and thick weather of all kinds in which seeing is difficult. Thick fog is very serious and is always to be avoided if practicable. Freezing weather, in which the rigging becomes clogged with ice and

the sails cannot be handled, is becoming less important as the number of sailing ships is reduced. Calms, which bereft the sailing ship of its motive power, are a blessing to steamers by insuring smooth water.

Air movements include: (1) trade winds (q.v.) and other winds (see WIND) of a permanent or semipermanent character; (2) periodical winds such as monsoons (see MONSOON), land and sea breezes, etc.; (3) variable winds of moderate force; and (4) storms (see STORM). As regards sailing ships the first three kinds of winds may be regarded as beneficent, as they furnish the means for locomotion, and as regards steamers they are either unimportant or

storms of wide and great severity have their birth in the tropics. The cyclonic storms which have their origins in the temperate zones mostly start from points in the eastern parts of the various oceans and move easterly across a continent before they reach the ocean again, so that usually their force is by that time greatly reduced. In many cases their tracks are curved so far to the northward at the eastern end as to be beyond the vicinity of much shipping. With the tropical cyclones the case is different. Their tracks are along populous coasts and over seas filled with ships and frequently extend beyond the fiftieth parallel of latitude. Their occurrence is confined almost wholly to the summer

AVERAGE STORM TRACK IN NORTHERN HEMISPHERE (WEST INDIES AND UNITED STATES).

only moderately objectionable. Storms, however, are to be shunned by all classes of vessels. They vary in character. Some are violent winds that are nearly constant in direction when blowing at maximum force. Such are the northers of the gulfs of Mexico and Tehuantepec, the pamperos of Uruguay and Argentina, and the mistral, bora, and levanter of the Mediterranean. The most important storms from a nautical standpoint are the cyclones, because they are of frequent occurrence, of large area, the winds are stronger than in most other sea storms, and their movements are responsible for the development of many of the local linear gales and heavy winds. See STORM.

A large percentage of the well-defined cyclonic

and autumn months and to the western side of the several oceans—the North Atlantic, North Pacific, South Pacific, and Indian oceans; they are unknown in the South Atlantic. The Arabian Sea and the Bay of Bengal are also visited by cyclonic storms which occur most frequently in May and October. A tabulation of West India hurricanes for the decade 1890–1900 showed that they occurred as follows: in June, 1; July, 2; August, 8; September, 19; October, 22; November, 4.

The four great centres of cyclonic activity are: the West Indies and the east coast of the United States; the Philippine Islands and China Sea; Samoa, Fiji, and Tonga Islands; Mauritius. On account of the volume of its seaborne trade the

first-named region is the most important, but the area which includes the Philippines, China Sea, and coasts of China and Japan is certainly a close second. From the number of vessels which traverse these seas our knowledge of the behavior of the storms in them is fairly complete.

It is noted that all tropical cyclones are born in regions of comparative calm about 10 degrees of latitude from the equator. The centre moves first to the westward and then its path curves gradually away from the equator and finally reaches northeast in the Northern Hemisphere and southeast in the Southern. The tracks are not always the same. The average path is different for each month and there are occasional marked exceptions to the general rules, owing usually to local meteorological conditions which modify those of the storm. The speed of movement of the centre of the cyclone along its track is variable. In the tropics it is from 5 to 20 miles per hour, always decreasing as the storm track turns away from the equator and recures and then increasing until a rate of 50 miles an hour is sometimes reached in temperate regions. Within the tropics the storm area is comparatively small, the violent winds seldom being found more than 150 miles from the centre. The barometric pressure falls rapidly, however, as the centre is approached, a difference of two inches having been observed within the distance mentioned. The winds therefore blow with greater violence, and their directions are more symmetrical with respect to the centre than is the case in higher latitudes. After recurring, the area usually increases and the winds become less severe. The centre is no longer a small, well-defined area over which the sky is nearly clear and near which the winds blow with the greatest violence, but broadens until it is not easily recognizable, and the strongest winds are often found at some distance from it.

The approach of a tropical cyclone is almost invariably preceded by a nearly cloudless sky and marked clearness of the atmosphere—*islands*, mountains, and distant vessels are seen with great distinctness, while the temperature is abnormally high and made more oppressive by a cessation or reduction of the ordinary breezes. All this is commonly accompanied by an unusually high barometer which becomes unsteady as the air disturbance approaches. The sky then begins to be covered by a light cirrus haze which becomes more and more dense until the true hurricane cloud appears on the horizon in the approximate direction from which the centre is approaching. Portions of this begin to be detached and drift across the sky, accompanied by rain squalls and wind of increasing force. The rain along the edges of the storm area is mist-like, with occasional showers which increase in frequency and heaviness towards the centre, where the rain falls in torrents. One of the indications of an approaching cyclone is a heavy swell coming from the direction of the centre, and this frequently sets in before any other indication becomes marked.

By the time the hurricane cloud appears on the horizon the barometer will be unmistakably falling. If the centre passes far away, the fall will not be great, but the weather will be unsettled and showers frequent; ordinary trades will be increased in force and squally north of the centre (in the Northern Hemisphere), while variable winds will be found south of the centre, usually from a southeasterly direction.

If the observer is within the real storm area the barometer continues to fall and, unless he is in the path of the centre, the wind will begin to shift, the changes usually being accompanied by heavy squalls. These changes afford a means of determining the direction of the centre and the path of the storm, so that it may be avoided. The wind does not blow exactly towards the centre, but around it in a manner to develop a sort of spiral in which the direction of the wind is opposite to that of the movement of the hands of a watch in the Northern Hemisphere and in the same direction as the hands of a watch in the Southern. This spiral effect and the storm tracks are shown in the accompanying plates. If an observer within the storm area faces the wind, the centre bears about 10 points (112.5°) to the right, if in the Northern Hemisphere, and 10 points to the left, if in the Southern. By noting the direction of the wind at frequent intervals the direction of the centre can be obtained a sufficient number of times to determine its approximate path and probable distance. If the barometer falls without a change in the direction of the wind, the observer is in the path of the centre.

Having determined the path of the centre, it can be avoided unless the sea is too rough to lay a proper course for the purpose, in which case vessels must heave to and let the storm pass by. Rules for the handling of vessels in cyclones are given in the article on navigation.

The instruments used on board ship for making weather observations are the thermometer, barometer, hygrometer, compass, rain gauge, wind gauge, or anemometer, and the barocyclonometer. With the exception of the last named these are of ordinary type and are adequately described under their own heads. The barocyclonometer is an instrument invented by Father José Algue, S. J., director of the Philippine Weather Observatory. It consists of a special form of aneroid barometer that is not absolutely essential to the operation of the instrument and a disk which is a graphic representation of the cyclonic wind swirl about the storm centre. Two pointers, which may be set at any angle, are pivoted at the centre of the disk, and one of these carries a secondary pointer pivoted about two-thirds the length from its own axis. By setting these in accordance with certain tabular data, with the corrected barometer readings and with the observed directions of the wind, the approximate distance and direction of the storm centre may be obtained as well as the speed along its path. The tables and storm disk were originally prepared for the typhoons of the East, but the instrument is now being adapted for use in the West Indies and along the United States coast. See METEOROLOGY; WEATHER; WIND; STORM; NAVIGATION; HYDROGRAPHIC OFFICE; CHART; PILOT CHART; also bibliography under METEOROLOGY, STORM, ETC.

ME'TER. See METRIC SYSTEM.

METER, ELECTRIC. See ELECTRIC METERS.

METER, GAS. See GAS, ILLUMINATING.

METH'ANE (from *methyl*), MARSH GAS, FIRE DAMP (Ger. *Sumpfgas*), CH_4 . The simplest of the compounds of carbon and hydrogen, usually prepared by strongly heating a mixture of sodium acetate and soda lime. It is one of the gaseous products of the decay of vegetable matter (especially cellulose) under water and is therefore a constituent of the gases bubbling up in the stagnant water of marshes; it is also one

of the gases evolved in petroleum wells, and natural gas contains about 90 per cent of methane. Considerable quantities of methane occur also in coal mines, where the gas, mixed with air, has often caused disastrous explosions. Methane is a colorless and odorless gas burning with a non-luminous flame. It is formed in the destructive distillation of organic matter, such as wood, coal, etc., and is, therefore, one of the principal constituents of ordinary illuminating gas, which contains 30-40 per cent of methane. A very large number of organic compounds can be derived from methane; and since the gradual building up of these compounds from the elements is a matter of great importance in organic chemistry, the synthesis of methane itself, as the first step in innumerable processes employed in producing organic compounds, formed a valuable contribution to chemical science. The synthesis of methane was first effected by Berthelot, who showed that the gas is produced when a mixture of carbon disulphide and water vapor is passed over red-hot copper. The reaction taking place is represented by the following chemical equation:

Carbon disulphide Water Copper Methane Cuprous sulphide Cupric oxide

In this manner methane can be obtained by using nothing but elementary substances as starting material, for carbon disulphide and water can be prepared by the direct union of their elements. Another synthesis of methane results when the silent electric discharge is caused to act upon a mixture of carbon monoxide and hydrogen. Still another synthetic method consists in the action of water upon the carbide of aluminium. But the most direct synthesis of methane was carried out by Bone and Jerdan, who succeeded in obtaining methane by heating its elements, carbon and hydrogen, to 1200° C. (2192° F.). Very pure methane may be prepared by decomposing zinc methyl with water or by the GRIGNARD REACTION (q.v.).

METHANE SERIES. See HYDROCARBONS.

METH'ODISM. The name given to the religious movement in England led by John Wesley, appropriated by the numerous churches which have sprung from that movement and by others which, though not bearing the name, are both historically and spiritually in the Methodist succession. Wesley himself was impatient of sectarian names and called the people whom he enrolled in classes for religious culture simply the United Societies and proudly appealed to the fact that to join the Societies there was needed no dogmatic or ecclesiastical test, all Christians from Anglicans to Quakers being alike welcome. His definition of a Methodist (abridged) was as follows: "A Methodist is one who has the love of God shed abroad in his heart by the Holy Ghost given unto him; one who loves the Lord his God with all his heart, and soul, and mind, and strength. He rejoices evermore, prays without ceasing, and in everything gives thanks. His heart is full of love to all mankind, and is purified from envy, malice, wrath, and every unkind affection. His one desire, and the one design of his life, is not to do his own will, but the will of Him that sent him. He keeps all God's commandments, from the least to the greatest. He follows not the customs of the world; for vice does not lose its nature through its becoming fashionable. He fares not sumptuously every day. He cannot lay up treasure upon the earth;

nor can he adorn himself with gold or costly apparel. He cannot join in any diversion that has the least tendency to vice. He cannot speak evil of his neighbor any more than he can tell a lie. He cannot utter unkind or evil words. No corrupt communication ever comes out of his mouth. He does good unto all men; unto neighbors, strangers, friends, and enemies. These are the principles and practices of our sect. These are the marks of a true Methodist. By these alone do Methodists desire to be distinguished from other men." Wesley's catholicity was so broad that he was not greatly concerned whether the books he reprinted for his people were by Roman Catholics or Unitarians so long as they were to religious edification. It was his hope that his movement would be the nucleus of a reunited Christendom, and it was with sorrow he saw forces which he could not control carrying his people into permanent separation. The title Methodist was not a word of his own choosing—it was given by Oxford students because of the strict life of Charles Wesley and his band in the university—but he took it up as a matter of course and it became an ecclesiastical watchword.

It must be remembered that the churches which go under the name of Methodism were not the largest part of the results of the movement. It stimulated tremendously every Protestant church, besides sending thousands of converts into those churches. It imparted new life and hope to Christendom. It was one of the forces which led to the abolition of slavery. Wesley initiated several charitable schemes, and his work overflowed into permanent forms of benevolence. The common people of England and America received such a stimulus to intellectual religious life and expression that they began to take an interest in education and political and social reforms. Laymen who were leaders in the meetings (class leaders, exhorters, local preachers) became protagonists in progressive propaganda. Political and social legislation of the nineteenth century rested back on a revived consciousness of the masses which was born of Methodism. Though Wesleyan Methodism itself was excessively conservative in the first half of the nineteenth century, partly because as a reaction to criticism and persecution it wanted to commend itself to the authorities and to the higher classes, and partly through an overtimid deference to the Established church, its members were thoroughly alive to popular rights—so much so that almost every important advance in political liberalism and social amelioration went hand in hand with an exodus of eager reformers out of Wesleyanism to form a new Methodist church or reinforce other churches or devote themselves solely to secular betterment. On the surface the secessions were ecclesiastical; deeper they were also political and economic—the cry of men awakened by the Gospel for the liberty of the sons of God. Before the Methodist movement did its work the sodden condition of the English peasantry was fearful. After its work was done the formation of political, agricultural, social, and literary societies was possible. The mass of the peasants could not have been moved at all, says Prof. J. Thorold Rogers, nor would the formation of agricultural unions have been possible, had it not been for the previous work of the Methodist preachers. (*Six Centuries of Work and Wages*, 6th ed., p. 516.) Wesley struck the first note of the temperance reform, and with terrific power. The religious

and moral interests of the movement were so engrossing that the people of England were saved from the extreme doctrines of the French Revolution and from a violent application of its healthful doctrines. Modern mission work at home and abroad, the institutional church, the cheap press, universal appeal by tract and pamphlet to the reason of the common man, were congenial to Wesley's large-minded insight into the needs of men and, with other modern methods, were anticipated by him.

Polity. The polity of early Methodism was suggested by exigencies in the growth of the revival of which it was the outcome. Methodism as an organization dates from 1739, the loosest possible in form. A few Christians met together weekly in classes (the class meeting) to pray and to talk concerning the things of God, over whom a leader (a layman) was appointed, whose duty it was to watch over their souls and to give spiritual counsel. The societies were independent of each other, except as they were held together by the itinerating Wesley, who appointed their leaders and to whom these leaders were responsible. In 1743 Wesley drew up the rules for the United Societies, which have remained the ethical standard of teaching and practice from that day to this. As the work extended, preachers were appointed. They were of two kinds: clergymen of the Church of England who affiliated with the movement and who were permanent pastors; and laymen, who were itinerants, moving at first every six months and then every year. In its inception Methodism was preëminently an episcopal movement, oversight, as in the Society of Jesus, being reduced to an exact science. Over the classes were the leaders; over both were the preachers, assisted in out-appointments by local preachers, who were laymen with the gift of public address and from whom the itinerants were recruited. Each preacher had his circuit, and several circuit preachers were under a head (whence arose the district and, in North America, the presiding elder). There were quarterly and district conferences and, after 1744, the annual conference, composed of both clergymen and lay preachers. Finally, over the whole movement was Wesley himself, giving it vitality, depth of impression, and breadth of view, saving it from fanaticism on the one hand and laxity on the other, ever guiding and really, though not officially and narrowly, dominating it. A general conference, meeting every four years, arose in the United States after 1792, owing to the great extent of the country.

The relation of the movement to the Church of England is not hard to define. Wesley was a sincere lover of the church of his fathers and hoped that the bishops would ordain his preachers and in some way articulate his results into the normal ecclesiastical life of the country. In this he was disappointed; but, nothing daunted, he went on his way independently, holding that he was justified in this by the unique position he occupied as the providential leader of the movement and consolidating what became a vast ecclesiasticism. Wesley tried to be a loyal churchman as far as circumstances allowed. As a rule he did not hold services in Church hours, nor would he allow lay preachers to administer sacraments. But England's call always sounded louder than the Church's, so that he came to feel that he was serving the Church best when disregarding her most. He invaded parishes constantly and was all the time building a church

that had no legal relation to Anglicanism whatever and almost no moral relation. Some of the state clergy persecuted his ministers and members bitterly, others favored them. By the study of the New Testament and early Church history he became convinced that, though only a presbyter in form, he was a real bishop, and therefore ordained clergy whenever he thought best.

After Wesley's death in 1791 the people called Methodists were governed by the Annual Conference, composed of the Legal Hundred, as the lawmaking body, and all the itinerant preachers as advisory and coöperative. The new denomination—as it has been legally since 1784, when Wesley entered a deed into the Court of Chancery constituting the Conference, and as it has been practically since 1740, when the movement separated from both Moravianism and Calvinism—came to be called the Wesleyan Methodist Connection or church. The territory was divided into districts for more efficient supervision, whose interests were looked after by the district meeting, and subdivided into circuits whose affairs were governed by a quarterly meeting composed of ministers, local preachers, and stewards, of whom the two last were appointed by the superintending pastor. Various efforts were made to tone down the hierarchical spirit and constitution of the church by introducing laymen into the annual conference and by giving the local church the right to elect its own officers, but these efforts were successful only at the cost of numerous divisions. Finally, in 1878, the Wesleyan Methodist church introduced the principle of lay representation thus far: that it allowed laymen to sit in the annual conference and deliberate with the ministers on all financial and benevolent causes, those of a pastoral nature being reserved to the clergy. In all the Methodist churches of Great Britain and her colonies there is only one order of ministers.

In 1784 Wesley ordained Thomas Coke (q.v.) superintendent for America, and at the Christmas conference of 1784-85, held in Baltimore, Md., the Methodist Episcopal church was constituted by the ordination of Francis Asbury as superintendent and the drawing up of an episcopal Church constitution. The new overseers assumed the title of Bishop, much to Wesley's disgust, who, out of deference to the Church of England, desired them to be called simply superintendents. But that he considered them to be bishops in the full sense there can be no doubt. In his letter to the conference stating and defending his position he says: "Lord King's account of the Primitive Church convinced me many years ago that bishops and presbyters are of the same order, and consequently have the same right to ordain. For many years I have been importuned to exercise this right"; but he refused out of deference to the established order. In America the case was different. There were no bishops, so that for hundreds of miles there was no one to administer the sacraments. "Here, therefore, my scruples are at an end, and I conceive myself at full liberty, as I violate no order and invade no man's right by appointing and sending laborers into the harvest." Of course it is understood that the American Methodist episcopacy is in order presbyterial purely, though it is certainly sufficiently Catholic in its powers of supervision, especially in its absolute control over pastoral appointments—a control that is, however, limited in practice when dealing with popular preachers and wealthy

churches. The other of the two orders is that of deacons, who are strictly differentiated from elders. It is, however, a principle of Methodism that no one type of Church order is of exclusive authority, that the Scripture lays down no model, and that therefore a church may exercise liberty in matters of polity if she is true to the spirit and general complexion of the apostolic church. The nonepiscopal Methodist churches are true to Wesley's idea of oversight through their conferences and districts, but presbyterian in ministry and congregational in some features of their administration. A peculiar feature of all Methodist polity is the itinerancy, or the removal of preachers from one charge to another, which is done by the bishops with the advice of the presiding elders in the Methodist Episcopal churches, and by a stationing committee in the other churches. In the Methodist Episcopal church the pastoral limit was placed at two years in 1804, at three in 1864, at five in 1888, and in 1900 the limit was removed entirely. Preachers are now reappointed from year to year by the bishops.

Theology. Few churches have had less doctrinal disturbances than the Methodist. No one has expressed more briefly and admirably the doctrines received by all Methodists than Bishop John H. Vincent: "I. I believe all men are sinners. II. I believe that God the Father loves all men and hates all sin. III. I believe that Jesus Christ died for all men to make possible their salvation from sin, and to make sure the salvation of all who believe in Him. IV. I believe the Holy Spirit is given to all men to enlighten and to incline them to repent of their sins and to believe on the Lord Jesus Christ. V. I believe that all who repent of their sins and believe on the Lord Jesus Christ receive the forgiveness of sin. This is justification. VI. I believe that all who receive the forgiveness of sin are at the same time made new creatures in Christ Jesus. This is regeneration. VII. I believe that all who are made new creatures in Christ Jesus are adopted as the children of God. This is adoption. VIII. I believe that all who are accepted as the children of God may receive the inward assurance of the Holy Spirit to that fact. This is the witness of the Spirit. IX. I believe that all who truly desire and seek it may love God with all their heart and soul, mind and strength, and their neighbors as themselves. This is entire sanctification. X. I believe that all who persevere to the end, and only those, shall be saved in heaven forever." As to the sacraments, Methodism holds that the Lord's Supper is a memorial of Christ's death for the spiritual feeding on him, that he is really present only in the hearts of those who receive him, and that baptism is a sign of a regeneration already accomplished by faith, and as to adults should be given only to believers. Infant baptism is administered to children whose parents desire, if they promise to bring them up in religion, on the ground that the child is already a member of the Kingdom of God. As to atonement, Methodists universally hold to the fact, but are not agreed as to theory. In England the penal substitutionary theory has been held, at least until recently, and that was the common view in America until Professor Miley, of Drew Theological Seminary, published his book on the atonement in 1879, advocating the governmental theory. But it has been the universal

conviction of Methodists that a real atonement was paid to God for the sins of the world, though in 1900 Professor Bowne, of Boston, advocated the view that it was an act of love to influence men, holding, however, that the sufferings of Christ bear a "vital and unparalleled relation to the forgiveness of sins." Christ as an object of faith, i.e., his absolute divinity, is held as fundamental, and in fact was one of the driving springs of the movement. Ritschlian views have filtered in among some of the younger ministers, but they are at the farthest pole from historic Methodist testimony. As to depravity, Methodists hold that it is total in the sense that no man is saved except through God's inciting and enabling grace, but not total in the sense of the Reformation creeds. In eschatology opinions differ. Unlike the older Methodists, some hold now to processes of salvation in an intermediate state for those who never heard of Christ." Dr. Pope presented this view in his *Theology* (1875-76), and his book was placed on the course of study for preachers. The natural immortality of the soul has always been maintained, the first dissident being Professor Beet in his *The Last Things* (1897; 3d ed., enlarged, 1899) and more explicitly in his *Immortality of the Soul: A Protest* (1901). His views were not acceptable to the church, and he was not continued in his professorship. Eternal punishment in some sense is a cardinal tenet. The general view of the final state of the heathen is that all who conscientiously live according to the light which they have received will be saved. It must be remembered that Methodism arose as a religious, not doctrinal, movement, and a narrow orthodoxy is both historically and theologically inconsistent with her genius. She has therefore generally been patient of diverging views, if they have not struck at the vitals of the gospel. For all that, Methodism has had doctrinal standards. In 1769 Wesley, who was legally himself the conference, proposed this test for his preachers: "To preach the Old Methodist Doctrines, and no other, contained in the Minutes of Conference." After 1798 new preachers in England were to be examined in the eight volumes of Wesley's sermons, and later a rigid catechetical examination on the candidate's orthodoxy on such doctrines as the eternal Sonship of Christ was instituted, quite contrary to the spirit of Wesley. Wesley's sermons and notes in the New Testament remain a legal standard in England, though liberally interpreted, and a moral one in America. On theological changes in Methodism, consult Sheldon in *American Journal of Theology*, 1906, pp. 31-52, and Faulkner in *Andover Review*, vol. xviii, pp. 487 ff., and in *New History of Methodism*, 1909, vol. ii, pp. 150 f.

Ethics. Wesley always retained some of the ascetic fervor of his High Church days, and set forth in his "General Rules for the United Societies" (1743) a standard of conduct of a strict and self-denying type. These rules forbade softness and needless self-indulgence, the using of many words in buying or selling, the use of intoxicants as a beverage, and the reading of books or the taking of diversions that could not be indulged in in the name of Jesus. The early Methodists were accordingly noted for their Quaker-like strictness of life, this even showing itself in regard to dress and jewelry; and they resembled the Puritans in their abhorrence of sports and amusements.

Worship. Wesley was attached to the liturgy of the Church of England and drew up for the societies at home and in America a service based on the Prayer Book, which he abridged and changed extensively. This was not adapted to American needs and was never used in America to any extent until recently. It was republished by the Rev. Charles S. Harrower in 1891, and the responsive parts have been widely adopted. But the spirit of Methodism seems opposed to the reading of prayers, and though a modest liturgical service was suggested by the General Conference of the Methodist Episcopal church in 1896, it goes no further than a responsive reading, the Gloria, and the recitation of the Apostle's Creed, and even this is too ritualistic for some churches. In special rites, however, like baptism, marriage, and burial, all Methodists use a prepared service.

HISTORY AND METHODIST DENOMINATIONALISM

England. (For the so-called Calvinistic Methodists, see CALVINISTIC METHODISTS; and for the "Calvinistic Methodist Church" of Wales, see PRESBYTERIANISM. - See also METHODIST EPISCOPAL CHURCH, SOUTH; METHODIST PROTESTANT CHURCH.) The paternal absolutism which Wesley exercised and which he left to his legal successors—the Hundred Ministers—could not endure. It was inevitable that the societies would assert their liberties. These liberties had reference to (1) holding service in church hours, which Wesley had opposed out of regard for the Established church; (2) receiving the sacraments in their own chapels from their own ministers; (3) lay representation in the conferences; and (4) the right of the local church to have a voice in the reception and expulsion of members, in the choice of local officers, and in the calling out of candidates for the ministry. All these principles except the last have been incorporated into all types of Methodism, but the honor of being the first to found a society upon them belongs to Alexander Kilham (1762-98). In 1795 Kilham published a pamphlet, *The Progress of Liberty*, which is a landmark in Methodism, as it is the first systematic presentation of the rights of ministers and laymen. For this book and for statements which were interpreted as reflecting on the conference he was expelled in 1796. Three ministers joined themselves to him immediately, and soon 5000 members were enrolled, the body taking the name of the *Methodist New Connection* at the date of its organization in 1797. In theology and polity it is similar to Wesleyan Methodism, except in the principle of representation. It was the first effective effort to adjust Methodism to the nonconformist principle and thus bring it to its logical conclusion.

With the building of chapels there had been a decline in the aggressive zeal of the field-preaching days of original Methodism. In the early part of the nineteenth century news was borne across the Atlantic of the marvelous success of camp meetings as a revival agency, and desire was felt by some to revive open-air meetings in England. Accordingly Hugh Bourne (1772-1852), assisted by William Clowes and other zealous Wesleyan local preachers and exhorters, held a camp meeting at Mow Cap, a hill between Staffordshire and Cheshire, May 13, 1807, and with such favorable results that several similar meetings followed. The parent conference in

1807 passed a resolution severely condemning such meetings, but Bourne persisted in his use of an evangelism so congenial to early Methodism. For this he and his companions were expelled, and in 1810 they organized an independent church, which in 1812 took the title of the *Primitive Methodist Connection*. In polity this body is similar to the New Connection church, except that it has two laymen instead of one to every minister in their conference, and is especially noted for its large use of laymen both in church government and in evangelism. It publishes an able review, the *Holborn Review* and sustains numerous schools and missions and all the appliances of a strong church.

A zealous young Wesleyan, William O'Bryan, felt called to carry the gospel to destitute villages of east Cornwall and west Devon in the early years of the nineteenth century, and had great success in these tours. As this necessarily carried him beyond the bounds of Wesleyan circuits, and as he could not limit his work to their harness, he was expelled for his zealous following of Wesley. In 1815 O'Bryan organized his first society, the work developed, other preachers were received, rules were drawn up in 1818, and in 1819 the first conference was held. His societies came to be called *Bible Christians*, although that was not adopted as the official name until 1828. In 1850 they sent Way and Rowe to Australia, where a strong cause has been built up. They also have missions in China. The polity of the Bible Christians is similar to that of the other bodies of reformed Methodists.

The forcing of an organ on the Brunswick Wesleyan Methodist Chapel in Leeds in 1828 against the wishes of the leaders and stewards caused the withdrawal of more than a thousand members and the formation of the *Wesleyan Protestant Methodists*. The dominating influence of Jabez Bunting (minister 1799-1858), who exercised an autocratic power over the conference, was the indirect cause of the next schism—that over the formation of a theological institution. The opposition to this scheme was led by Dr. Samuel Warren, who was then minister at Manchester and who was expelled in 1835. He was the father of the famous novelist of the same name. Thousands of members sympathized with him and left the church, forming the *Wesleyan Methodist Association*, which in 10 years numbered 21,176 members. Independent speech and action in the conference being impossible under Bunting, an outlet for criticism was found in anonymous publications and periodicals. To find out the authors of these articles strong measures were adopted, and every member of the Wesleyan Methodist conference was subject to a system of rigid questioning. For failure to answer these and other questions James Everett and other ministers of standing were expelled in 1849. The revulsion against these proceedings was equal to that against state control in Scotland six years before. One hundred and twenty thousand members left within three years and the contributions fell off £100,000. This separation helped to swell the nonconformist churches, but many kept up a Methodist organization—generally called the *Wesleyan Reformers*—until 1857, when they united with the *Protestant* (Leeds) and *Association* (Warren) Methodists to form the *United Methodist Free Churches*. This body carries on large missionary and educational work. Its polity is thoroughly representative, and is congre-

gational as to the supremacy of the local church in purely local affairs.

In 1907 the Methodist new connection, the Bible Christians, and the United Methodist Free churches united in one church—the United Methodist church. No substantial change had to be made in the polity. The creed in 12 short articles, though general and liberal, is evangelical and orthodox. The church's headquarters are at 12 Farringdon Avenue, London, E. C., and its publications include the *United Methodist*, the *United Methodist Magazine*, and other literature. It has extensive missions in China, and some in Africa.

Under the charge of English Wesleyan Methodism in 1854 the connectional relief and extension fund was inaugurated, in the same year that the Wesley Chapel fund was established on a new basis, and in 1861 the metropolitan chapel-building fund for the building of 50 new churches in and near London was founded by the gift of £50,000 by Sir Francis Lycett. The Children's Home was established in 1873 by the Rev. Thomas Bowman Stephenson, which has developed into a magnificent charity, with branches in several cities and a house in Canada. In 1873 the Sunday School Union was founded for the extension of that cause. But the most important change is the introduction of laymen into the annual conference since 1878. There are now two sections of the conference—a ministerial for the consideration of matters relating to the clergymen and a mixed section for the financial and other matters in which all are interested. This tardy and partial recognition of laymen has given an impetus to the parent church, seen especially in the munificent gifts for the million-guinea century fund in 1899-1902.

Ireland. In Ireland, Wesley had been preceded by Thomas Williams, who in 1747 gathered a society in Dublin. Wesley came in that same year and was greatly encouraged, and all through the second half of the eighteenth century both English and native itinerants traveled through the country, establishing societies in some towns, but being frequently mobbed, fined, and imprisoned. In the Irish rebellion of 1798 the Methodists were the special objects of Irish wrath and suffered numerous tortures. It was they who saved Dublin from being sacked by timely communication of the intentions of the rebels. The first Irish conference was held in 1752. But Methodism was unable to affect Irish life deeply. The membership has never reached 30,000, and the highest number was, as far back as 1814, 29,388. The Irish were even more insistent on receiving the sacrament at the hands of their own ministers (rather than from the Episcopal church) than the English were, and in this they were favored by Dr. Coke, who frequently presided over the conferences. In January, 1818, the *Primitive Wesleyan Methodist Society* was formed under the leadership of the apostolic Adam Averell, whose banner was "The sacrament from the Established church." The regular Methodist church in Ireland declared for independence. In 1878 the two united.

Scotland. Wesley found Scotland stony ground. He received an attentive hearing, but not much response. Whitefield told him plainly that he had "no business in Scotland." But he persevered and established his societies. The Rev. D. Butler has shown in two interesting studies the influence of Wesley on Scotland and the debt which Wesley himself owed to Scougal's

Life of God in the Soul of Man (1671), a book that he had reprinted in 1744. Consult Butler, *Wesley and Whitefield in Scotland* (Edinburgh, 1898), and *Henry Scougal and the Oxford Methodists* (Edinburgh, 1899).

France. English soldiers carried Methodism to Jersey in the Channel Islands as early as 1779, and Robert Carr Brackenbury, a wealthy layman, who could speak French, was sent there in response to their converts. Wesley himself spent a fortnight in the islands in 1787, preaching and exhorting from house to house. In 1790 the mainland was invaded, and from that day to this Methodism has always had a foothold in France. In 1818 Charles Cook began his ministry there. Cook died in 1858 and left his two sons to carry on his work. In 1852 France was made a separate conference and the full supervision of the mission was left in her own hands. Some notable men have wrought their lives into French evangelization—Cook and his two sons, Emile F. and Jean Paul, Gallienne, Hocart, and Gibson. One of the best lives of Wesley ever written we owe to this mission, that by J. W. Lelièvre (1868; trans., 1871; new ed., 1900). In 1907 the Methodist Episcopal church started a flourishing work in the Savoy, with centre at Grenoble.

Germany. A young Württemberger, C. G. Müller, went to London in 1805 on business, was converted, became a local preacher, in 1830 returned to south Germany, became a missionary of the Wesleyan conference, and when he died in 1853 left 67 preaching places, 20 local preachers, and 1100 members, chiefly in Württemberg. In 1849 Ludwig S. Jacoby went out from America, and for 50 years English and American Methodism labored in different sections of the German Empire. In 1898 England handed over to the Methodist Episcopal church her missions in Germany and a union was effected.

Italy. In 1852 the French Methodists sent M. Rostan to the Piedmont valleys, who established several stations. In 1861 the Wesleyan Methodist conference in England sent Green and Piggott to Florence, and they soon had flourishing missions in north Italy. In 1872 Leroy M. Vernon began his work in Bologna as representing the Methodist Episcopal church. Further particulars as to European Methodism will be found under *Missions*.

America. The first Methodist society in the New World was recruited from the German refugees to Ireland driven out of the Palatinate by Louis XIV. Two of these, Philip Embury and Barbara Heck, had been converted in Ireland, and upon arriving in New York, in 1760, they began preaching. Thomas Webb, an army captain and local preacher, also preached in New York and elsewhere, and about the same time (1766) Robert Strawbridge, another Irishman, started the work in Maryland, where he was assisted by Robert Williams, who was the apostle of Virginia. In 1769 Wesley sent out Richard Broadman and Joseph Pilmoor, and two years later Francis Asbury and Richard Wright. In 1773 their first conference was held—10 ministers with 1160 members. In spite of the disastrous influence of the Revolutionary War, at its end they had 80 preachers and nearly 15,000 members. Most of the Episcopal clergy had fled, and Wesley tried to get a bishop in England to ordain one of his preachers for America. Failing in this, he concluded that he himself had authority. The societies in America, Wesley said,

"are now at full liberty to follow the Scriptures and the primitive Church, and we judge it best that they should stand fast in that liberty wherewith God has so strangely made them free." He accordingly ordained, Sept. 1, 1784, Whatcoat and Vasey as deacons, on the next day elders, and Coke superintendent. He furnished them with a liturgy and collection of psalms and hymns, articles of religion abridged from the Thirty-nine Articles of the Church of England, and told them to organize the American societies into a church. This was done at the celebrated Christmas conference in Lovely Lane Chapel, Baltimore, Dec. 24, 1784 to Jan. 2, 1785, where Asbury was ordained deacon, elder, and superintendent, the societies taking the name of the *Methodist Episcopal church*.

The catholicity of the new church was shown by Wesley's method in regard to both doctrine and discipline. Everything of a sectarian nature was stricken out of the Thirty-nine Articles, so that as they left Wesley's hands they could be subscribed to by almost any evangelical Christian. Nor did he insert any of his own teachings. His design was to provide a generous platform on which all who loved the Lord could rally. As to discipline, no one mode of baptism was made obligatory, and even rebaptism of such as had scruples of their baptism in infancy was permitted, and although kneeling was recommended on the reception of the Lord's Supper, it was distinctly conceded that it might be received standing or sitting. Nor were people required at first to give up membership in their own church in order to become Methodist; so long as they "complied with our rules" they were to have full liberty of attending their own churches. On the other hand, no one could be admitted to communion but members of the society, or such as had received tickets from the preacher. Members who neglected their class meetings were liable to expulsion, and also members who married "unawakened persons"—rules that have gone by the board long since.

During the national period the growth of Methodism has been extraordinary. Its polity is vigorous yet elastic, and provides for close supervision of all parts of the field. This it does by reviving the apostolate or apostolic episcopate and adapting it to present-day needs. Itineracy has given it the opportunity to meet the immigrant face to face while establishing his family in their new home, and it has thus been able to proclaim the gospel everywhere on American soil. But this would have been impossible without a band of preachers alert, brave, consecrated, self-sacrificing, ready to go anywhere with the message of salvation. Perhaps history has never seen a truer type of home missionary than the itinerant preachers of Methodism. Ready to obey orders like the Jesuits, strong to preach like the Dominicans, they have gone everywhere, threading forests, fording and swimming rivers, making friends with Indians or with chance settlers, traveling through parishes a hundred miles or more in extent, meeting their appointments with the regularity of a machine, running the gauntlet of all kinds of dangers. These men of the first generations of Methodists revived the earliest traditions of Christianity. The emphasis put on preaching has been another cause of success. Necessarily deficient in learning, the preachers made up for that by study (a course of study was early prescribed), reading, and contact with men. But they learned above all to be

preachers—ready, powerful, interesting extemporaneous preachers. Emphasis on religious experience, personal knowledge of Christ, and victory over all sin gave both preachers and people a buoyant, triumphant life, and this sense of reality and power invested the pulpit with authority and fascination and its people with a vitalizing influence over others. At a time when the prevailing type of Christianity was Calvinistic the Methodists came with the gospel of a free, full, and present salvation, which they preached with tremendous earnestness and without philosophical refinements. Methodism has therefore been a revival church.

The government of the Methodist Episcopal church was completely in the hands of the preachers, who received their appointments annually from the superintendents, who were thus invested with large legal and indefinite moral power. This excessive clericalism was the occasion of the first two schisms. James O'Kelly, an earnest Irishman of warm piety and strong personality, tried to have the right of appeal to the conference recognized in the case of a preacher who felt oppressed by an appointment by the Bishop, and, failing in this, led a schism in Virginia in 1792. He organized the *Republican Methodist church*, which was finally absorbed by other movements. Of greater significance was the agitation to admit laymen into the church councils, which, being refused by the General Conference of 1824, led to a new church, in 1828. See METHODIST PROTESTANT CHURCH.

To many minds at one time slavery seemed the article of a standing or falling church. At the beginning Methodism had taken strong ground against slavery, but exigencies of the work in the Southern States led to an abandonment of the old ground. The antislavery men of the North would not yield, however, and in 1843 organized the *Wesleyan Methodist Connection* at Utica, N. Y. In government they are similar to the Methodist Protestant church. They hold stricter ground in regard to secret societies, intemperance, and dress, than the old church. This church has its headquarters in Syracuse, N. Y., where it publishes the *Wesleyan Methodist*. It supports missions in Sierra Leone, Kunso, and other unhealthy parts of West Africa. The great division on slavery was that in 1844-45, in connection with the case of Bishop James O. Andrew, who had married a slaveholding wife. (See METHODIST EPISCOPAL CHURCH, SOUTH.) The latest division of consequence was that in western New York in 1860, when the *Free Methodist church* was organized, a reaction towards the strenuous ideals of primitive Methodism in regard to secret societies, plainness of dress, the use of tobacco, and in the interests of positive Christian teaching and practice. It has its headquarters in Chicago, Ill., and North Chili, N. Y., publishes the *Free Methodist*, and supports missions in Africa, India, Japan, and China. It put two new articles in its creed—sanctification and eternal punishment. Other and smaller separations have taken place, prompted by a desire either for a more democratic or for a purer Christianity, or both, the latest being the organization of the *Independent Methodist church* at Newark, N. J., in 1900.

Colored Methodism has had free course in the United States. Housed at first in the parent church, the colored people came out in Philadelphia under Richard Allen in 1816 and organized the *African Methodist Episcopal church*. Four

years later the *African Methodist Episcopal Zion church* was organized in New York. The *Colored Methodist Episcopal church of America* was organized by action of the Methodist Episcopal church, South, Dec. 16, 1870. The Methodist Episcopal church has colored conferences in the South, but she had never elected a colored bishop since the death of Francis Burns in 1863, until 1904, when Scott was elected Missionary Bishop of Africa.

The struggle for the rights of laymen in America has been similar to that in England. The Methodist Episcopal church, South, not only (since 1869) admits laymen to the General Conference in equal numbers, but admits four laymen from every district in the annual conference. The African churches do the same. After the organization of the Methodist Protestant church, 1828-30, the agitation rested in the Methodist Episcopal church until 1852, but it was not until 1872 that that church granted place to laymen in her supreme council, and then only to the extent of two laymen from each annual conference, which gave the preponderance to the ministers three to one. In 1900 the ratio of representation was made equal. In 1912 this church in its General Conference voted down a resolution to admit laymen into the annual conference.

Canada. The Palatines, who did so much for Irish Methodism and who founded the church in the New World, were also the organizers of the first class in Canada—at Augusta, Ontario, in 1778. In fact, it was the same Paul and Barbara Heck, their sons and relatives, and the widow and son of Philip Embury, who constituted that class. George Neal, a school-teacher in the Niagara district, preached to the people on Sunday and on week evenings after 1786, and gathered his converts into classes. He kept up this work for years, but was not ordained until 1810. William Losee was the first itinerant minister. He preached in and around Kingston in 1790 and following years, and in 1791 and thereafter Canada was regularly supplied with ministers from the United States. In 1800 there were one district, four circuits, seven preachers, and 936 members. Relations with the Episcopalians were not always friendly. Canada was a part of the Genesee conference of the Methodist Episcopal church until 1824, when the Canada conference was organized. In 1828 the church was made independent and became the Methodist Episcopal church in Canada. The English Methodists began work in Montreal in 1814, extended it into Ontario in 1818, and took over the Methodist Episcopal church in 1832, though the latter resumed an independent existence in 1834. Methodism in the eastern provinces was founded by the apostolic William Black, a notable figure, who began his work in Nova Scotia in 1782. Other branches of English Methodism were likewise planted in Canada. In 1874 the Wesleyan Methodist church of the Dominion united with the New Connection church, and in 1883 these united with the Methodist Episcopal, Primitive Methodist, and Bible Christian—making one Methodism in Canada. The union has been very successful. A bold attempt was made between 1905 and 1913 to unite in one church the Presbyterians, Congregationalists, and Methodists of Canada, and all doctrinal, ecclesiastical, and legal matters were arranged satisfactorily; but on account of a strong minority of Presbyterians holding out, the union is being held in abeyance

as inexpedient for the present. There are also colored churches.

Australia. Two schoolmasters and farmers, who were sent out from England to take charge of the convict schools, established the first class, in Sydney, March 6, 1812. They soon applied for a missionary and in 1815 Samuel Leigh, "the apostle of Australia," landed and took up the work. Others followed, and wonderful success attended their labors, often wrought with heroic self-sacrifice and bravery. In 1820 Methodism went to Tasmania, 1822 to the Friendly Islands, 1823 to New Zealand, 1835 to the Fiji Islands, 1838 to South Australia, and 1839 to Western Australia. In 1854 all the Wesleyan Methodist churches were united in one conference (including New Zealand), and in 1873 those of Tasmania and the South Sea Islands were united with these, making the Australasian church. The Primitive Methodist and other English Methodist denominations were also established in Australia, but in 1900-02 these all united with the Wesleyans, making one Methodism in the South Pacific.

Missions. All the Methodist churches sustain extended missionary operations, but it is impossible here to do justice to their work. A society was gathered in Sierra Leone in 1792, and in 1811 the Wesleyan conference sent George Warren as the first missionary to Africa. Churches have been established among both natives and Europeans, and in 1884 William Taylor opened up the Congo country. Bishop Hartzell has done much towards coördinating the work over a vast territory with the progress of civilization. In 1814 Thomas Coke, with six missionaries, founded the first Methodist missions in Asia, which have realized great results. The American church sent Melville B. Cox to Africa in 1833, and William Butler founded missions in India in 1856, which have recently achieved notable results among the peasants of north India—the natives coming into Christianity faster than they can be cared for. In 1873 Butler also began work in Mexico, where hospitals, schools, and churches have been established. William Taylor also did a great work in India and Bishop James M. Thoburn ranks with William Butler and William Taylor for efficiency, enthusiasm, and influence in India. Numerous missions exist in South America. Scandinavia has proved a good soil for Methodism; even Finland has been entered, and Switzerland has several societies. In 1900 the Methodist Episcopal church made John H. Vincent resident Bishop in Europe, where there are already five conferences. Mission work in China has had marvelous success, considering the circumstances, and various Methodist bodies are working there in harmony. In Japan, efforts have been made to merge the Methodist denominations into a single Japanese church, and in 1906 a union of the Methodist Episcopal church, of the same, South, and of the Methodist church of Canada was effected. In 1900 missionaries were sent to the Philippine Islands. Russia was entered in 1907.

Education. It was not till 1834 that it was decided to open institutions for the training of ministers, and even then amid much opposition, partly on account of fear of loss of the old spirituality, freshness, and independence, and partly on account of the preponderating influence of Bunting. In 1834 an institution was opened at Hoxton, London, removed to Richmond, Surrey, in 1843; another was opened in

Stoke Newington in 1839, merged in the Richmond school in 1843. The Didsbury institution, near Manchester, received students in 1842; that at Headingly, near Leeds, in 1868; that at Handsworth, near Birmingham, in 1891. These schools are both academic and theological, and not on the grade of American theological seminaries. These, as well as Wesley College for

N. Y., was founded in 1825. The oldest college is Wesleyan University (1831), at Middletown, Conn. Between 1820 and 1847 academies and colleges furnished all the education received in school in theological branches by candidates for the ministry, and that was meagre, as classical and scientific studies necessarily predominated. There was in fact a deep-seated prejudice

boys at Sheffield, the Leys School in Cambridge, and Trinity College, Taunton, are in connection with the Wesleyan Methodist church, which also supports a system of day schools having 159,000 scholars and an annual expenditure of £259,000, with training colleges for teachers in Westminster and Southlands. In Ireland there are Wesley College, Dublin, and the Belfast Methodist College. In Australia and New Zealand there are three theological institutions and ten colleges. The Primitive Methodists have a college for ministers at Manchester, and colleges for youths in York and Birmingham. The United Methodist church has a theological institution at Ranmoor, near Sheffield, opened in 1864, Shebbear College

against theological schools, lest they should become centres of heresy, as well as deprive men of that spirituality, earnestness, and self-sacrifice which characterized early Methodist preachers. It was not till 1840 that the first theological institution was opened, that at Newbury, Vt., removed to Concord, N. H., in 1847, to Boston in 1867, and incorporated in Boston University in 1871. Garrett Biblical Institute at Evanston, Ill., now in connection with Northwestern University (the largest university in Methodism), began in 1856, and Drew Theological Seminary at Madison, N. J., in 1867. Gammon Theological Seminary, for colored preachers, was founded in South Atlanta, Ga., in 1883. The Methodist

at Highampton, Devon, Ashville College and a girls' school at Edgehill.

In America Cokesbury College was opened at Abingdon, Md., in 1787. After eight years of vicissitudes it was burned. It was rebuilt, but was burned again in 1797. In 1817 an academy was built at Newmarket, N. H., closed Dec. 30, 1823, but opened again at Wilbraham, Mass., Nov. 5, 1825. The oldest academy having a continuous existence is at Kent's Hill, Me., founded in 1821. Cazenovia Seminary, at Cazenovia,

Episcopal church has 10 theological institutions, 32 colleges and universities, 34 classical seminaries, besides numerous women's schools, 18 institutions for colored, and 240 of all kinds in foreign fields. A postgraduate university was begun in Washington, D. C., in 1892 by Bishop Hurst, but was not opened for instruction till 1914. (See AMERICAN UNIVERSITY.) There are important schools for classical and theological instruction at Frankfort-on-the-Main and Bareilly, India, and smaller schools in other mis-

sion fields. The Methodist Episcopal church, South, reports 147 schools and colleges, one of the largest being Vanderbilt University at Nashville, Tenn., with a theological school, organized in 1875. On account of a decision of the courts that Vanderbilt University could not be controlled by the bishops, Asa G. Chandler established the beginnings of a university in Atlanta, Ga., in 1914, to be in more direct relation to the church, of which the theological department is organized. The Methodist Protestant church has colleges at Adrian, Mich. (1859; theological department, 1882); Westminster, Md. (1868; theological department, 1882); and Kansas City, Kans. (1896). The Free Methodists have a college at Greenville, Ill., and seminaries at North Chili, N. Y.; Spring Arbor, Mich.; Orleans, Neb.; Seattle, Wash.; Wessington Springs, S. Dak.; Los Angeles, Cal.; and Evansville, Wis. Canada established an academy at Cobourg, Ontario, in 1836, which was made a college in 1841, the first degree-conferring body in Ontario; a medical faculty was added in 1854, law in 1860, theology in 1871, and the whole (Victoria University) removed to Toronto in 1892. The Wesleyan Theological College, Montreal, was established in 1873, and the Mount Allison College, Sackville, N. B., in 1859. There are several academies and female colleges.

Journalism and Publishing Interests. There are many weekly and monthly periodicals. The *Wesleyan Methodist Magazine*, London, was established under the name of the *Arminian Magazine* in 1778, the *London Quarterly Review* in 1853, the *Primitive Methodist Quarterly* (now *Holborn Review*) in 1858, the *Methodist Review*, New York, in 1818 (quarterly, 1830; bimonthly, 1885), the *Methodist Review*, Nashville, 1847, and the *Canadian Methodist Quarterly* in 1889 (merged in the *Methodist Magazine*, Toronto, in 1896). The oldest official weekly in American Methodism is the *Christian Advocate* of New York, founded in 1826.

Statistics. According to the latest figures obtainable the statistics of Methodist communicants in Great Britain, Ireland, Australasia, and Canada in 1914 and in the United States in 1914 were as tabulated on page 511.

For the earliest history of the movement the journals of George Whitefield (1st ed., London, 1771-72) and of John Wesley are indispensable (the best edition is that edited by N. Curnock, 8 vols., New York, 1911-16). See also *Cambridge Modern History*, vol. vi (New York, 1906).

METHODIST CHURCH, FREE. See METH-
ODISM.

METHODIST EPISCOPAL CHURCH. See
METHODISM.

METHODIST EPISCOPAL CHURCH, SOUTH. The history of the Methodist Episcopal church, South, as an organization separate and distinct from the Methodist Episcopal church, began in 1844, when the church was divided into two branches. For history up to that time, see METHODISM.

The three largest churches of this country (Methodist, Baptist, and Presbyterian) have long been divided into Northern and Southern branches, and it is quite impossible to understand these divisions without a reference to

American slavery. The question the answer to which divided the church and the nation was how to abolish slavery and how to handle the situation while public sentiment was being brought to the point of demanding that the slaves be freed. More and more leading Methodists in the North came to feel that the only way for the church to free itself from responsibility for this evil was to forbid its ministers and members from owning slaves on penalty of excommunication. Southern Methodists were equally sure that if the church took this action it would result in destroying the influence and perhaps the very existence of the church in the slaveholding States, and would certainly bring to a speedy end the great work that was being done by the Methodist church in the South among both slaveholders and their slaves. By 1844 the differences of opinion had become so radical and so irreconcilable that the General Conference authorized a division of the church.

In pursuance of the plan of separation adopted at the General Conference of 1844 representatives of the church chosen by the various annual conferences located in the Southern States met in a convention in Louisville in May, 1845, and with great unanimity organized the Methodist Episcopal church, South. The first quadrennial General Conference of the Methodist Episcopal church, South, convened in Petersburg, Va., in May, 1846, being presided over by Bishop Joshua Soule and Bishop James Osgood Andrew, who had cast in their lot with the Southern church at the time of the division. Rev. William Capers and Rev. Robert Paine were elected to the episcopacy at this conference. This conference took all the steps necessary to put the machinery of the church in running order. About 20 annual conferences and 450,000 communicants fell to the Southern church under the plan of division.

The Articles of Religion, 25 in number, which constitute the basis of Methodist theology in so far as it is in common with that of other Protestant churches, were taken from the Thirty-nine Articles of the Church of England. Among the doctrines peculiarly characteristic of Methodist faith and most emphasized in Methodist preaching may be mentioned the Fatherhood of God, the unlimited atonement of Jesus Christ, the moral free agency and accountability of man, the witness of the Holy Spirit testifying to the regenerate believer of his acceptance with God, the possibility of apostasy, and the attainability by grace of entire holiness. These doctrines are in the published sermons of John Wesley, which are recognized as doctrinal standards, legal or moral, in all branches of Methodism. The preaching of this evangelical type of theology has made Methodism intensely evangelistic, and no branch of world-wide Methodism has shown happier results from the preaching of these doctrines than the Methodist Episcopal church, South.

The most characteristic feature of the polity of the Methodist Episcopal church, South, is the "conference." The work of the church is done largely through its various conferences, of which there are five, as follows: 1. *The Church Conference*, composed of all the members of any local church. 2. *The Quarterly Conference*, which meets four times a year and is composed of the pastor in charge of the church and all the male members of the church holding an official position, such as stewards, trustees, class leaders,

superintendents of Sunday school, etc. It attends to all the business affairs of the pastoral charge. The presiding elder is ex-officio chairman of the quarterly conference. 3. *The District Conference*, which meets but once a year and is composed of all pastors having charges in the district and residing within the district and of all local preachers and certain lay delegates elected by each quarterly conference. The district conferences have on an average some 20 or more pastoral charges in them. 4. *The Annual Conference* meets once a year, as the name indicates, is composed of all traveling preachers living and working in its bounds and of certain lay delegates elected annually by the district conferences, and is presided over by a bishop. The bishops meet in May of each year and distribute the annual conferences among themselves, each bishop as a rule having from three to six conferences to preside over. 5. *The General Conference* meets quadrennially and is composed of an equal number of clerical and lay delegates elected by the various annual conferences, the number of delegates which each annual conference is entitled to being determined by its size. The General Conference is the one and only lawmaking body of the church. It is presided over by the bishops in turn. It elects quadrennially the general agents, secretaries, editors, etc., and also elects from time to time as many bishops as may be needed for the general superintendency of the church.

The second most characteristic feature of Methodist church polity is its itinerant ministry. Preachers are distinguished as local and itinerant or traveling. Every traveling preacher must belong to an annual conference and receive his appointment from the presiding bishop annually. A traveling preacher is supposed to give his whole time to the work of the Christian ministry and to receive his support from the church in return for his labor. A local preacher, on the other hand, chooses his own vocation and supports himself, but is supposed to preach only so often as opportunity offers and as he may find it convenient to do so. A traveling preacher cannot be returned to the same pastoral charge more than four successive years. The itinerant system gives every effective traveling preacher a pastoral charge every year and supplies every pastoral charge with a preacher. Bishops hold office for life. They choose their own places of residence, but each bishop receives from his colleagues annually his assignment of annual conferences over which he is to preside for the year.

The general direction of the more important interests of the church is committed to certain "connectional boards," the members and executive officers of which are elected quadrennially by the General Conference. The interests committed to these connectional boards are as follows: (1) Sunday schools; (2) home and foreign missions; (3) education; (4) church extension; (5) young people's organization known as the Epworth League; (6) the board having charge of the publishing interests is known as the Book Committee. The leading publishing house of the church is located in Nashville, Tenn., with branch houses in Dallas, Tex., and Richmond, Va. It is the largest publishing house in the Southern States. All the connectional boards have their headquarters in the publishing house at Nashville, Tenn., except the Church Extension Board, which is located in

Louisville, Ky. The one official volume of the church called *The Doctrines and Discipline of the Methodist Episcopal Church, South*, is published quadrennially, immediately following the General Conference, which body alone has power to alter it. Among the important and influential periodicals issued by the publishing house may be mentioned the *Methodist Review*, published quarterly, and the *Christian Advocate*, issued weekly, while each of the above boards issues a publication devoted mainly to its own interests. The literature of the Sunday-school department is very widely circulated. Most of the annual conferences have well-equipped colleges both for men and for women. The church has recently established theological seminaries at Atlanta, Ga., and Dallas, Tex. There are successful missions in Mexico, Cuba, Brazil, Japan, China, and Korea, with a total membership in all these fields of over 30,000. For figures, see METH-
ODISM.

Organic Union. In 1915 negotiations were under way between the Methodist Episcopal church, the Methodist Episcopal church, South, and the Methodist Protestant church, looking towards the organic union of all three of these churches in one organization which will probably bear the name of the Methodist Church of America.

METHODIST NEW CONNECTION. See METHODISM.

METHODIST PROTESTANT CHURCH.

Instituted in 1828 and organized under its present title in 1830, this church traces its origin through the Methodist Episcopal church, back to the Evangelical Reformation begun in England by John and Charles Wesley, of Oxford University, and presbyters of the Church of England. The separation from the mother church grew out of the controversy for the rights of the laity in the lawmaking councils of the church. After years of desultory discussion William S. Stockton began the publication of the *Wesleyan Repository*, which was intended to provide a medium for the more formal examination of what came to be called "the mutual rights of the ministry and laity" and to spread abroad the views of leading ministers and laymen on the subject. This publication was followed in 1824 by a publication called *The Mutual Rights of Ministers and Members of the Methodist Episcopal Church*, with the same general object in view. The views of the reformers were embodied in a formal petition to the General Conference of 1824, but in a curt reply the bishops denied this right of petition. This was followed by the organization of union societies, whose object was to unite the reformers and present to the ensuing General Conference a petition that would obviate the objection made at the previous conference that the reformers were merely scattered agitators with conflicting aims and uncertain objects. In 1827 a general convention of reformers was held in Baltimore, composed of 100 delegates from seven different States, who prepared a memorial to be presented to the next General Conference, praying for the admission of laymen into the legislative councils of the church. After three weeks of deliberation the memorial was denied. This seemed to put an end to the resources of peaceable reform. The protestants again and again professed their loyalty to the church and their strong desire to remain in its communion, but they were soon threatened with expulsion. They were charged with breaking the General Rules

of Wesley which forbid "speaking evil of magistrates and ministers." One of the leaders of that day voiced the sentiment of those who opposed the contention of the reformers. "You publish," he said, "the Mutual Rights, and say you will not discontinue that publication. You also say you will not withdraw from the Methodist Episcopal church. Now we are reduced to one of two alternatives, either to let you continue to agitate the church or to expel you." At no time was there a charge of heresy or immorality brought against the reformers. On the other hand, they had been the cherished friends of many of the foremost men in the church, including Bishop Asbury himself.

Those who were expelled were left no alternative but to organize another branch of Methodism. They had no contention with Methodism, but they could not consent to the suppression of their convictions and the privilege of expressing them. They did not object to the episcopacy, but they did protest against the exercise of arbitrary episcopal authority. They sorrowfully took up the task of organizing a Methodist church in conformity with the fundamental principles which Protestantism had bequeathed to the world, and they sought to express these ideas in the name they gave the church. The church was organized without the change of a single word in the doctrines of Methodism. In polity a presbyterial form of government was chosen. The itinerant system for stationing ministers was retained, but ministers were given the right of appeal from the stationing authority if for any reason they thought themselves afflicted by their appointment. There is only one order of ministers recognized in the church. The presiding officers of the conferences are elected every year, though they may be reelected. It has often been said that there is now little difference between the two Methodisms. The fact is that the real difference is just as great as it ever was, though it is pleasant to note that the differences are no longer a cause of bitterness and bad feeling. The real difference is this: in the Methodist Episcopal church the unit of power is in the bishops; in the Methodist Protestant church the unit of power is in the laity. The laymen, in equal numbers, share in every legislative action and in every election of the church. The church was formally organized in 1830. It now has 32 conferences, 16 mission conferences, 1551 ministers, 648 local preachers, 191,300 members, and church property valued at \$7,589,576. It has a well-organized conference in Japan and some mission work in China. It has five colleges and one theological seminary, and has organized boards of missions, education, church extension, and preachers' aid. See METHODISM.

METHO'DIUS (also called EUBULIUS) (?-c. 311). A Greek theologian of the third century, a martyr and Church father. He was Bishop of Olympus in Lycia and perhaps of Tyre. He was a contemporary of Porphyry and suffered martyrdom about 311. Epiphanius calls him "a very learned man and a strenuous asserter of the truth," but he is not mentioned by Eusebius. He vigorously opposed Origen. Of his numerous works, which are mostly dialogues, several exist complete either in Greek or Syriac, the most important being the *Symposium*, a Christian counterpart to Plato's *Symposium*. It is in Migne, *Patrol. Græca*, xviii, and has been edited by Bonwetsch (Leip-

zig, 1891); there is an English translation in the *Ante-Nicene Fathers* (vol. vi). Consult Adolf Harnack, *Geschichte der altchristlichen Litteratur* (Leipzig, 1893), and Bonwetsch, *Die Theologie des Methodius von Olympus* (Berlin, 1903).

METHODIUS. The apostle to the Slavs. See CYRIL AND METHODIUS.

METHOD OF AGREEMENT, OF CONCOMITANT VARIATIONS, OF DIFFERENCE, AND OF RESIDUES, IN LOGIC. See INDUCTION.

METHOD OF CHARACTERISTICS. See CHARACTERISTIC.

METHOD OF EXHAUSTIONS. See EXHAUSTIONS.

METHOD OF LEAST SQUARES. See LEAST SQUARES, METHOD OF.

METHOW. See SALISHAM STOCK.

METHUEN, mē-thū'en. A town in Essex Co., Mass., 30 miles north of Boston, on the Spicket and Merrimac rivers and on the Boston and Maine Railroad (Map: Massachusetts, E 2). It is a beautiful residential town, and has the Nevins Memorial Library, a fine high-school building, and the Nevins Home for Aged and Incurables. There are manufactures of cotton and woolen goods, yarns, etc. The government is administered by town meetings. There are municipal water works. First settled about 1641, Methuen was part of Haverhill until 1725, when it was incorporated as a separate town. Pop., 1900, 7512; 1910, 11,448; 1914 (U. S. est.), 13,123; 1920, 15,189.

METHUEN, mēthū'en, PAUL SANFORD, third BARON (1845-). An English field-marshal, born at Nynehead, Somersetshire, and educated at Eton. He entered the army in 1864 as lieutenant of the Scots Guards; served in the second campaign of the Ashanti War in 1874, and after four years as attaché in Berlin became assistant adjutant general for the Home District in 1881. In the Egyptian War (1882) he was staff officer and quartermaster-general, and in Bechuanaland in 1884-85 he won a C.M.G. From 1892 to 1897 he was commander of the Home District, and on the outbreak of the Boer War was put at the head of the first of Buller's three divisions, to relieve Kimberley. He was entirely unsuccessful in this attempt, being severely checked and wounded at Modder River, and, a week after, Nov. 30, 1899, losing in a frontal attack on Magersfontein nearly 1000 men. He retired to Modder River. Methuen, together with Hunter, formed the left in Lord Roberts's victorious movement on Pretoria in May and June, 1900. In March, 1902, he was captured by De la Rey and Kemp on the way from Vryburg to Lichtenburg. The troops were almost immediately released, and with them Lord Methuen, who had been wounded in the brief engagement. He was commander in chief of the Eastern Command in 1903-08, was general officer commanding in chief in South Africa in 1907-09, and in 1909 was Governor of Natal. In 1910 he was made G.C.V.O., and in 1911 field marshal.

METHUEN TREATY. A treaty concluded May 16, 1703, between England and Portugal. Soon after the outbreak of the War of the Spanish Succession Portugal agreed to support England against France, and hence a formal treaty was negotiated by Sir Paul Methuen, the English Ambassador at Lisbon, by which Portugal was to furnish 28,000 troops; but of these the maritime Powers were to provide main-

tenance and payment for 13,000, and a force of 12,000 Dutch and English was to protect the Portuguese harbors. Politically this treaty had the effect of making Portugal the devoted political adherent of England for more than a century. In its commercial aspects the treaty is almost still more interesting. The wines of Portugal were to be admitted into England upon the payment of a duty 33½ per cent less than the duty paid upon French wines. For this England received proportionate advantages. The result was that for generations the English gentry were addicted to the drinking of port, the Portuguese wine.

METHU'SELAH. According to Gen. v. 21 ff., son of Enoch, grandson of Jared, and father of Lamech, of the line of the Sethites, who attained to the age of 969 years. In Gen. iv. 18 the name of Lamech's father appears as Methushael, and he is represented as the grandson of Irad, and great-grandson of Enoch, who is here son of Cain. The similarities are so striking that many scholars regard the two lists as only variants of one original genealogy. Methuselah is composed of two elements, *Methu*, 'man,' and *Shelah*, probably the name of a deity; Methushael seems to mean 'man of God.' Two Babylonian lists of antediluvian kings are known to exist. One of them is quoted from Berosus by Eusebius (ed. Schoene, pp. 7 ff., 31 f.). It gives 10 names. The eighth is 'Amēpsinos, Amempsinos, which probably corresponds to an Akkadian *Amel Sin*, 'man of Sin.' This name actually occurs as that of an ancient sage or king in cuneiform inscriptions cited by Zimmern. *Mutu-sha-ili Sin*, 'man of the god Sin,' would be a variant of this name, corresponding exactly with Methushael, if the proper name of the Babylonian god is dropped, as it naturally would be by the Hebrew writer. *Shelah*, which also occurs in Gen. x. 24, may have been another name for the moon god Sin. Of the other Babylonian list, written in the Sumerian language, we have as yet only a preliminary account by Langdon. It apparently begins with a creation story, gives the names of 10 antediluvian patriarchs, or kings, and then narrates the coming of the deluge whose hero is Tagtug, a name corresponding in meaning to Noah, according to Langdon and Sayce. Consult Hommel in *Proceedings of the Society of Biblical Archaeology*, vol. xv (London, 1892-93); Zimmern in Schrader, *Die Keilschriften und das Alte Testament* (Berlin, 1902); Stephen Langdon, also A. H. Sayce, in *Proceedings of the Society of Biblical Archaeology*, vol. xxvii (London, 1914).

METH'Y. The burbot (q.v.).

METH'YL (from Gk. μέθυ, *methy*, mead + ὕλη, *hylē*, wood), CH₃. The simplest univalent radicle found in carbon compounds. See CARBON COMPOUNDS; CHEMISTRY (historical section); TRIPHENYL-METHYL; VALENCY.

METHYL ALCOHOL, WOOD ALCOHOL, or PYROXYLIC SPIRIT, CH₃OH. A colorless liquid having a peculiar aromatic odor. It boils at 64.96° C. (148.93° F.) and mixes with water in all proportions. It is largely used in the manufacture of varnishes and for the preparation of "methyated spirit" (q.v.). Methyl alcohol is one of the products obtained when wood is heated in retorts, out of contact with the air. It is contained in the aqueous portion of the distillate, mixed with pyroligneous (crude acetic) acid, ammonia, acetone, etc. To separate the acid, the mixture is neutralized with slaked lime

and distilled, the acid then remaining fixed as calcium acetate. Ammonia may be eliminated in a similar manner, by adding sulphuric acid and distilling. Further, to separate the alcohol from acetone (which is especially objectionable if the alcohol is to be used in the manufacture of aniline dyes), oxalic acid may be added to the mixture and a gentle heat applied. Methyl alcohol, when brought in contact with oxalic acid, forms the crystalline solid substance called methyl oxalate, while acetone does not react with oxalic acid, and remains in solution. After separating the solid methyl oxalate from the remaining liquid, methyl alcohol may be re-obtained from it by dissolving in potash and distilling. Finally, the alcohol may be freed from water and any remaining impurity by rectification over quicklime. Pure methyl alcohol may also be distilled from commercial wood spirit after the addition of one-tenth of its weight of iodine and just enough caustic soda to decolorize the solution: all the ordinary impurities of wood spirit are thus converted into iodoform. Methyl alcohol forms double compounds with a number of inorganic salts, such as the chlorides of lithium, calcium, and magnesium, and, as Loeb has shown, with the iodide of sodium. When taken into the stomach, wood alcohol acts as a violent poison. A peculiar feature of its toxic action is that a dose insufficient to cause death may cause complete blindness. Methyl alcohol was discovered by Boyle in 1661.

METHYLATED SPIRIT. Ethyl alcohol, or spirit of wine, to which methyl (wood) alcohol has been added to render it unfit for use in beverages. It is used as a cheap substitute for ethyl alcohol, since the manufacture of ordinary alcohol is heavily taxed by most governments. In 1907 the United States, following the example of other countries, removed the tax from alcohol properly denatured or made unfit for drinking, and as the tax of \$1.10 per proof gallon (alcohol $\frac{1}{2}$ gal., water $\frac{1}{2}$ gal.) was 10 times the cost of production, a great saving to users and a great extension of the use of alcohol resulted (see FUEL). The formula for the legally denatured or methylated alcohol is 100 parts ethyl alcohol, not less than 90 per cent pure, 10 parts of wood spirits, and $\frac{1}{2}$ part of benzine. This mixture is almost as suitable for general use as a solvent or fuel in burners or engines as pure ethyl alcohol. In cases where this mixture is not suitable, such as the manufacture of certain chemicals and drugs, the law allows the manufacturer to obtain permission to use special denaturants.

METHYLENE BLUE. An aniline dye, occurring in the form of a bluish, finely crystalline powder with a bronzelike lustre. It is slightly soluble in water, and much more freely upon the addition of alcohol. It is largely used as a stain for pathological and normal tissues and for specimens of blood. It has proved of some value in the treatment of gonorrhœa, and claims are made for it as a substitute for quinine in malaria. See COAL-TAR COLORS.

METHYLENE (from *methyl*) **DICHLORIDE**, or DICHLOROMETHANE, CH_2Cl_2 . A chemical compound of carbon, hydrogen, and chlorine. It can be obtained by the direct action of chlorine gas on methane (marsh gas), or by the action of nascent hydrogen on chloroform. It is a colorless heavy liquid, having a chloroform-like odor and boiling at 40°C . (104°F). It

is a powerful anæsthetic, and has been used as a substitute for chloroform. Its effect on the organism is more even than that of similar anæsthetics. When treated with a methyl-alcoholic solution of ammonia, it is converted into hexamethylene tetramine.

METHYL PYROCATECHIN. See COAL-TAR COLORS; GUAIACOL.

ME'TIS (Lat., from Gk. *Mētis*, counsel). The daughter of Oceanus and Tethys and first wife of Zeus, who devoured her in the fear that the son whom she should bear would be more powerful than himself; from the head of Zeus then sprang the goddess Athena.

METIUS, mǎ'tê-ŭs, ADRIAAN (1571-1635). A Dutch geometer, born at Alkmaar. The name Metius seems to have been a nickname which he received as a student, but which he kept and which, on account of his prominence, was adopted by his brothers and his father. The latter's name was Adriaan, and hence Metius is also known as Adriaan Adriaanszoon. He studied law and medicine, but later devoted his attention to astronomy, and from 1598 until his death was professor of mathematics at the University of Franeker. His mathematical works include: *Doctrinæ Sphæricæ Libri* (1598); *Astronomia Universæ Institutiones* (1605; 2d ed., 1630); *Praxis Nova Geometrica* (1623); *Problemata Astronomica* (1625); *Calendarium Perpetuum* (1627); *Opera Astronomica* (1633); *Arithmetice Libri 2, et Geometricæ Libri 6 . . . Trigonometricæ Planorum Methodus* (1626); *De Genuino Utriusque Globi Tractatus* (1624); *Primum Mobile Astronomicæ, etc.* (1631; 2d ed., 1632-33).

METLAKAHTLA, mět'lă-kă'tlă (properly *Matlakhatla*). A mission settlement of Chimesyân or Tsimshian Indians, on Annette Island, southern Alaska, made a reservation by Act of Congress, March 3, 1896 (Map: Alaska, O 8). The original settlement was some 70 miles farther south, below Port Simpson, on the mainland of British Columbia. Here the Episcopal missionary William Duncan in 1862 established a mission, which within a few months was joined by the whole body of Indians residing near Port Simpson, and prospered so rapidly that in 1886 it had developed into a town of 1500 civilized Indians, with two-story houses, regular streets, a salmon cannery, saw mill, etc., and one of the largest churches in British Columbia. An extensive shawl-weaving industry was also carried on. Unfortunately the British government permitted the imposition of religious and other unacceptable restrictions on the mission, with the result that almost the entire settlement, led by Duncan, abandoned the place and established themselves in 1887 at the present location in United States territory, where they continue to maintain their advanced civilization. Although many of the natives established independent homes outside of the reservation, the colony numbered 602 souls in 1910. In 1913 the United States Bureau of Education, at the request of many of the Indians, opened a government school, which is in part supported by the natives. Consult H. S. Welcome, *Story of Metlakatla* (New York, 1887), and K. J. Arcander, *Apostle of Alaska* (ib., 1909).

METONIC CYCLE (so called from its inventor, Meton, who flourished at Athens about 432 B.C.). A cycle of 19 years of 235 lunar months, or 6940 days, at the end of which time the new moon falls on the same day of

the year as it did at the beginning of the cycle, and eclipses recur in nearly the same order. This arises from the circumstance that 19 solar years are nearly equal to 235 lunations, their average values being 6939.68835 and 6939.60249 days respectively. As the Greek states reckoned by lunar months, and on this reckoning depended the recurrence of many religious festivals, while on the other hand certain other rites were connected with the recurrence of the seasons, there was a constant effort to bring the solar year (365 days, 5 hours, 48 minutes, 46 seconds) into accord with the period of 12 lunar months (354 days, 8 hours, 48 minutes, 33.6 seconds). Before Meton the favorite cycle was the Octaëteris (or, as it was sometimes called, Enneateris), of eight years with three intercalary months of 30 days. The inaccuracy thus arising was removed by Meton, who in the period of 19 years inserted seven intercalary months, of which five had 30 and two had 29 days. They were inserted in the 3d, 6th, 8th, 11th, 14th, 17th, and 19th years. The slight inaccuracy that remained was reduced by Callippus about a century later, by combining four Metonic periods into a "great year" of 76 calendar years and omitting one day in the intercalation, obtaining 27,759 days. The details of Meton's cycle are not very clear and there is considerable difference of opinion among scholars in regard to them. Unger places the beginning of Meton's cycle on July 16, 432 B.C.; Oppert on July 28, 433 B.C. It is agreed that the Callippic cycle began June 29, 330 B.C. The Attic calendar, as laid down by Unger, is as follows:

YEAR OF THE CYCLE

MONTHS	I	II	III	IV	V	VI	VII	VIII	IX	X
Hecatombeon.....	30	29	30	30	29	29	29	30	29	30

See CALENDAR, first paragraph, at end; GOLDEN NUMBER.

METON'YMY (Gk. *μετωνυμία*, *metónumia*, change of name). A figure of rhetoric by which one thing is put for another to which it bears an important relation, as a part for the whole, the effect for the cause, the abstract for the concrete, etc. For example, "Lying lips are an abomination to the Lord."

METOPE, mēt'ō-pē (Lat. *metopa*, from Gk. *μετόπη*, *metopē*, space between beam ends, from *μετά*, *meta*, between + *ὀπή*, *opē*, aperture). The space between the triglyphs (see TRIGLYPH) in the frieze (q.v.) of the Doric order. As this space in the developed Greek architecture is always filled by a slab, usually relatively thin, the name is generally applied to the slab. This was often decorated with sculpture in high relief, as in the Parthenon (q.v.), at Olympia (q.v.), and at Selinus (q.v.), or with painting. Even where sculpture was used, the background and the relief seem to have been painted in contrasting colors. Consult E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911), and P. Gardner, *The Principles of Greek Art* (ib., 1914).

METRE. In music, the division of a composition into parts whose rhythm is similar and whose time is equal. The smallest element in

metre is the *measure* (q.v.); a *section* comprises two measures, and two sections make a *phrase*. The largest division is the *period*, which consists of two phrases. Theoretically metre differs from rhythm in that the latter deals with accents and

with actual and typical patterns which metre arranges in groups in accordance with their time-value. But this definition is not universally accepted, and exactly *opposite* significations are often given to the two terms.

METRE. A designation applied without great precision to measured or rhythmic language called verse; also the rhythmical measure of verse. In those languages whose versification depends not only on the number of feet in a line, but also on the length of the syllable or syllables in each foot, metre designates both the character of the line as a whole and that of the feet composing the line. This is true, e.g., of Latin and of Greek. In such languages as do not depend on the length of individual syllables for their verse systems, metre applies to the number of stresses or beats in a line, or on the number of counted syllables. This is true, e.g., of the Germanic and the Romance languages, although attempts have been made to employ long and short syllables as in the ancient languages. See **VERSIFICATION**.

METRICAL FOOT. In versification, the designation of the rhythmical unit in a verse. In Greek or Latin poetry this unit may be composed of one or more syllables, all long, or short and long, in various arrangements, as the *spondee*, *dactyl*, *anapæst*, etc. In the Germanic and Romance languages the unit may be a single stressed syllable, or a combination of a stressed and one or more unstressed syllables. The metrical foot is marked here not by quantity of individual syllables, but simply by this accentuation or stressing, which corresponds with the regular accentual system of the language, and not necessarily, as in Greek or Roman poetry, with a long syllable. See **VERSIFICATION**.

METRIC SYSTEM (from Lat. *metrum*, from Gk. μέτρον, *metron*, measure, from μετρέω, *metrein*, to measure). A system of weights and measures invented by the French in the latter part of the eighteenth century. From earliest times, civilized people have possessed two ideas concerning their standards of weights and measures: that they should be invariable, and that their prototype should be found in nature. From the earliest times great diversity in the kinds of units and in the size of the same units has always characterized systems of measures. As early as 1558 Henry II tried to correct the standard units of France, and a Gabriel Mouton, vicar of St. Paul at Lyons, proposed in 1670 a comprehensive decimal system remarkably similar to the metric system of to-day, while other propositions were made for scientific and natural weights and measures in France. But not until 1790 did the French government undertake the making of a new system. For this purpose a committee of the Academy of Sciences was appointed under the authority of the National Assembly and sanctioned by Louis XVI, and an interesting feature of the plan was that Great Britain also should concur in the determination of a natural unit of weights and measures. The committee consisted of Borda, Lagrange, Laplace, Monge, and Condorcet. Of the three linear bases proposed, the length of a seconds pendulum, a quadrant of the terrestrial equator, and a quadrant of a terrestrial meridian, the committee reported in favor of the last, one ten-millionth of which should be the standard unit of linear measure. Delambre and Méchain were appointed to measure the meridional distance from Dunkirk to Barcelona, the same task which

Cassini had undertaken in 1669. This work, difficult in itself, was made the more so by the political revolutions of the times, and required seven years for its completion. The finally computed length of the terrestrial quadrant was in part verified by a comparison with a similar result found by Bouguer and La Condamine in Peru (1736). The length, expressed in English measure, is 32,808,992 feet. Sir John Herschel later estimated the quadrant to be 32,813,000 feet, which made the meter $\frac{1}{10^7}$ of an inch shorter than one ten-millionth of a meridional quadrant. In 1793 a temporary commission of 12 was appointed, with Borda as president, to make a comparison of all the units then used in France, and to determine the kinds and composition of the metals to be used in constructing the new standard units, their forms of construction, and finally the place and means of their preservation. In 1798 the European states were invited to send representatives to a conference at Paris, the object being to examine the work executed during the preceding eight years by the various commissions. Nine states responded. Their delegates, together with the 10 French commissioners, were divided into committees, which reviewed the work so far accomplished.

On June 22, 1799, the standard units, the meter and kilogram, duly made by expert scientists and instrument makers, were presented to the Council of Five Hundred, and deposited in the archives at Paris. In December of the same year the Council adopted these standards. The use of the new system, however, was not made obligatory in all departments until 1837.

The hope of the inventors of the metric system, that it would become the universal system of all civilized nations, seems likely to be realized, for its use has been made obligatory in Germany, Austria-Hungary, Belgium, Brazil, Chile, Argentina, Spain, France, Greece, Italy, Mexico, the Netherlands, Peru, Portugal, Rumania, Servia, Norway and Sweden, Switzerland, Bulgaria, Siam, and Uruguay; its use has been legalized in Egypt, the United States, Great Britain, Japan, Russia, Turkey, Bolivia, Canada, China, Paraguay, and Venezuela. Several attempts have been made to introduce the metric system in the United States or to adopt a similar system. On Jan. 15, 1790, Congress ordered the Secretary of State, Thomas Jefferson, to prepare a uniform system of weights and measures. Jefferson, who had been Minister to France, reported, on July 14, a system founded on the length of a seconds pendulum in the mean latitude of the United States (38°), or in the latitude of 45° . But the English system was not disturbed. Again, in 1821, Congress sought to revise the system of weights and measures, and John Quincy Adams, Secretary of State, recommended in the strongest terms the adoption of the metric system.

In 1866 the law which made the metric system legal in the United States was passed, and the meter was legally and officially defined as equivalent to 39.37 inches, from which conversely by reference to the international standard of length the customary units of length in the United States are now derived. The same legislation directed that the 5-cent piece should weigh five grams and have a diameter of two centimeters; that the unit for weighing letters in post offices should be the gram. But these

details were imperfectly carried out. The use of units in electrical engineering, based on the metric system, was determined by the law of 1894. Bills have been introduced to the House of Representatives several times, proposing to make the metric system obligatory. Although compulsory legislation may not be immediate in the United States, the adoption of the metric system is constantly extending, as shown by its use in weighing foreign mail matter, in weighing at the mints, in certain government publications, in the Pharmacopœia and the Dispensatory, in base measurements and the computations of the Coast and Geodetic Survey, and in much of the work of the arts and sciences, especially in electrical engineering.

The basal units of the metric system are: for length the meter, for small surfaces the square meter, for area of land the square dekameter (or are), for volume the cubic meter, for capacity the liter, and for weight the gram. The scale selected for the multiples and subdivisions of the various units is 10. The prefixes used to designate the multiples of the measuring unit are deka (10), hekto (100), kilo (1000), and myria (10,000), all from the Greek, and those used to designate subdivisions are deci (0.1), centi (0.01), and milli (0.001), from the Latin.

The ratio between the successive denominations in the system of linear measure, of weight, of capacity, and of money is 10, the ratio between the successive denominations of surface measure is 100, and that of cubic measure is 1000. The unit of capacity, the liter, is equal to a cubic decimeter, and approximately so to the volume of a kilogram of water at the maximum density. Its equivalent is 1.05671 liquid quarts (United States) or 0.8799 liquid quart (British). The unit of weight, the gram, is the mass weight of one cubic centimeter of water, standard pure, at the maximum density. Its equivalent in the English system is 15.432356 grains.

Note should be taken that in the following tables where equivalents are given the United States customary measures are stated, not the Imperial measures of Great Britain, which in the case of the gallon, bushel, etc., differ considerably.

TABLE OF LINEAR MEASURE

A myriameter	= 10,000 meters
A kilometer (km)	= 1,000 "
A hektometer	= 100 "
A dekameter	= 10 "
Meter (m)	
A decimeter (dm)	= 0.1 meter
A centimeter (cm)	= 0.01 "
A millimeter (mm)	= 0.001 "
A micron (μ)	= 0.000001 "

TABLE OF SQUARE MEASURE

A square myriameter	= 100,000,000 square meters
" kilometer (km ²)	= 1,000,000 "
" hektometer or hektare	= 10,000 "
" dekameter or are (a)	= 100 "
Square meter (m ²)	
A square decimeter (dm ²)	= 0.01 of a square meter
" centimeter (cm ²)	= 0.0001 "
" millimeter (mm ²)	= 0.000001 "

TABLE OF CUBIC MEASURE

A cubic myriameter	= 10 ¹² cubic meters
" kilometer	= 10 ⁹ "
" hektometer	= 1,000,000 "
" dekameter	= 1,000 "
Cubic meter (m ³)	
A cubic decimeter (dm ³)	= 0.001 of a cubic meter
" centimeter (cm ³)	= 0.000001 "
" millimeter (mm ³)	= 0.000000001 "

A cubic meter is also called a *stere*, a unit used in measuring wood.

TABLE OF WEIGHTS

A metric ton (t)	= 1,000,000 grams = 1,000 kilograms
A quintal (q)	= 100,000 " = 100 "
A myriagram	= 10,000 " = 10 "
A kilogram (kg)	= 1,000 "
A hektogram	= 100 "
A dekagram	= 10 "
Gram (g)	
A decigram (dg)	= 0.1 gram
A centigram (cg)	= 0.01 "
A milligram (mg)	= 0.001 "
A mikrogram (γ)	= 0.000001 "

A metric or international *carat*, used in weighing diamonds, is 200 milligrams, and this international unit was adopted in the United States in 1913.

TABLE OF CAPACITY

A hektoliter (hl)	= 100 liters
A dekaliter (dkl)	= 10 "
Liter (l)	
A deciliter (dl)	= 0.1 liter
A centiliter (cl)	= 0.01 "
A milliliter (ml)	= 0.001 "
A mikroliter (λ)	= 0.000001 "

APPROXIMATE EQUIVALENTS

A meter	= 39.37 inches = 3 $\frac{1}{4}$ feet
A kilometer	= $\frac{5}{8}$ of a mile
A liter	= 1 United States liquid quart
A kilogram	= 2 $\frac{1}{4}$ pounds avoirdupois
A gram	= 15 $\frac{1}{2}$ grains
A hectare	= 2 $\frac{1}{2}$ acres
A square meter	= 10 $\frac{3}{4}$ square feet

The advantages of the metric system over the English-American system are numerous. Although, in both systems, the standard units of volume, capacity, and weight are directly connected with the standard unit of measure, the relation in the metric system is far more simple. Thus, in the usual system one United States liquid quart has a volume of $57\frac{3}{4}$ cubic inches, while in the metric system one liter has the volume of one cubic decimeter; in the English system the pound has the weight of about 0.0156 of a cubic foot of water at the standard temperature, while in the metric system one gram has the weight of one cubic centimeter. Although the names used in the metric system are generally longer than the names used in the English-American system, the nomenclature of the former has several advantages. Thus, the prefixes deci, centi, milli, deka, hekto, kilo have in point of derivation a numerical significance and have other applications in the language, while the names inch, foot, yard, rod, and mile are devoid of numerical significance and are distinctive in their use. But the greatest advantage of all results from the use of a uniform scale of relation. In the English-American system seldom do more than two units in succession have the same scale. Thus, in the metric system, 10 centimeters = 1 decimeter, 10 decimeters = 1 meter, . . . , the ratio being always 10; while in the English system, 12 inches = 1 foot, 3 feet = 1 yard, $5\frac{1}{2}$ yards = 1 rod, . . . , the ratio changing between every pair of units. The French Commission of 1790 reported in favor of the decimal scale for reasons of expediency, although admitting that the uniform scale of 12 possessed many advantages.

The metric system was once thought to be superior to all other systems of weights and measures in being founded on an invariable magnitude, one ten-millionth of a terrestrial quadrant. But science dispelled this illusion by showing that this magnitude is not a constant and that the distance originally taken as the

basis of the meter was inaccurately measured. The unit distance is now defined as equivalent to the distance between terminal lines on the international prototype meter, a bar of platinum iridium at the International Bureau of Weights and Measures near Sèvres and measured when at the temperature of melting ice (0° C.). Through the researches of Professor A. A. Michelson (q.v.) its length is now known in the terms of the wave length of light, thus making the standard distance replaceable and independent of the prototype standard.

In 1840 the French government conceived the idea of exchanging sets of the metric units for sets of the units of other nations in order to promote an international interest in the metric system. The international expositions at London (1851) and at Paris (1855) were, on account of the immense variety and confusion of metrical units, the first practical demonstrations of the need of a universal decimal system of weights and measures. At the Paris Exposition of 1867 a committee, representing several different nations, was appointed to consider the question of uniformity, and was called the Committee of Weights, Measures, and Moneys. Mathieu was the president of this commission. The committee recommended instruction in the metric system in the public schools and its use in governmental departments and in scientific publications. The Geodetic Association, which met at Berlin in 1867, was also representative of several nations, and likewise favored the general adoption of the metric system. In the year 1869 a committee of the Academy of Sciences at Paris and one of the St. Petersburg Academy recommended the convocation of an international commission, which should consider the means of providing all nations with sets of standard metric units. Such a commission was invited by the French government, and assembled at Paris in 1870. Twenty-four countries responded by sending delegates, Joseph Henry and Julius E. Hilgard representing the United States. This body was divided into committees, the most active one being the French section, during the interval of suspended operations during the Franco-Prussian War. This committee deliberated and consulted for the purpose of devising means for copying the standards preserved in the archives. Some of the questions which concerned the committee were the composition of the metal to be used in constructing the new unit of length, the most desirable form of cross section, ways of expressing the length, as the distance between the ends, or between two fine lines made on the bar, means of comparing the new unit with the standard of the Archives, means for determining its variation due to changes in temperature, and other considerations. The International Committee reassembled in 1872 and it was duly proposed that an international bureau of weights and measures be located at Paris, the definite conception of the International Bureau being later decided upon at the diplomatic conference of 1875. At the second meeting of the International Commission in 1872 it was decided to make the standard meter and the standard kilogram of the Archives the actual bases for the new standards. In order to give the work of the commission the character of an international act, its members so far being simply citizens of their respective countries, the French government invited plenipotentiaries and delegates from all the nations interested. Representatives

from 20 states assembled at Paris (1875) to constitute the Diplomatic Conference of the Meter. E. B. Washburne acted as plenipotentiary and H. Vignaud as delegate for the United States. The Observatory of the International Bureau, decided upon by this conference, was completed in 1878. It stands at the entrance of the park of St. Cloud, near Sèvres, on a reservation presented by the French government. The management of the Bureau reposes in the International Committee under the authority of the General Conference. In the Observatory are kept the instruments used in the determination of the international standards, the chief of which are the comparators, balances, and thermometers. The extent of the demands upon this Bureau may be inferred from the fact that, by 1913, 25 different countries had formally sanctioned the national prototype standards received from the International Bureau and known in terms of the international prototype. The meters are highly polished metal bars made of an alloy of platinum and iridium, and the kilograms are cylinders of the same material.

Bibliography. For an outline history of the metric system, with its present status, its equivalents, and particularly for a full bibliography bearing on its development, consult Hallock and Wade, *Evolution of Weights and Measures and the Metric System* (New York, 1906); a complete history in which the founding of the International Bureau of Weights and Measures is discussed is Bigourdan, *Le système métrique des poids et mesures* (Paris, 1901); an excellent work in small compass is Ch. Ed. Guillaume, *Unités et Etalons* (ib., 1893); as is also his *La Convention du mètre et le Bureau International des Poids et Mesures* (ib., 1902); id., *Les récents progrès du Système Métrique*, various reports, notably those of 1907 and 1913 (ib., 1907-13); also Fonvielle, *Le mètre international définitif* (Paris, 1875); Barnard, *Metric System* (3d ed., Boston, 1879); Potts, *Elementary Arithmetic* (London, 1886); Bassot, *School of Mines Quarterly* (New York, 1901), and various publications of the International Bureau of Weights and Measures and the United States Bureau of Standards (Washington), particularly for equivalents *Circular No. 47* (Washington, 1914). In opposition to the introduction of the Metric System into the United States and Great Britain much has been written, among which might be mentioned Halsey and Dale, *The Metric Fallacy* (New York, 1903), and various papers in the *Transactions of the American Society of Mechanical Engineers* (ib., annually). See WEIGHTS AND MEASURES.

METRONOME (from Gk. μέτρον, *metron*, measure + νόμος, *nomos*, law). A small machine for indicating the correct time or speed at which a musical composition should be played. It was invented in 1816, and consists of a pendulum, actuated by clockwork, which swings in front of a graduated scale. To the upper part of the pendulum-rod is attached a movable weight which can be set at any figure indicated by the scale. The figure 60 means that when the weight is set there the pendulum swings 60 times a minute. Thus it beats exact seconds. When set at 120 it beats half seconds. The metronome indication appears always at the beginning of a composition. M. M. (Mälzel's metronome, from its reputed inventor, Mälzel) $\text{♩} = 80$ means that the tempo must be taken so that 80 half notes fill the space of one minute.

The indications differ with the tempo and time of each composition. A work written as allegro in common time might be indicated: M. M. $\text{♩} = 100$; allegro in alla breve: M. M. $\text{♩} = 100$; adagio in $\frac{3}{4}$: M. M. $\text{♩} = 66$; scherzo (*Presto* $\frac{3}{4}$): M. M. $\text{♩} = 120$. By means of the metronome the composer is enabled to give the minutest directions in respect to the tempo, for the old terms allegro, andante, presto, etc., can only serve as *approximate* indications, leaving much to the temperament of the individual performer. The metronome is of the greatest value and is much used to-day in training beginners to play strictly in time.

METROPOLIS. A city and the county seat of Massac Co., Ill., 38 miles by river east by north of Cairo, on the Ohio River and on the Illinois Central and the Chicago, Burlington, and Quincy railroads (Map: Illinois, G 11). It is built on a high bluff which slopes gradually towards the river. A fine railroad bridge has been erected recently at this point. There are three city parks, a Carnegie library, hospital, the beautiful Fort Massac State Park, sanatorium, and fine Odd Fellows' Temple, courthouse, music hall, and city hall buildings. There are potteries, saw and planing mills, flour mills, veneer, box, stave, heading, spoke, automobile parts, and basket factories, a flourspar separating and refining plant, tie-treating plant, bottling works, and large lumber interests. There are extensive deposits of potters' clay in the vicinity. The government is administered by a mayor, elected every two years, and a unicameral council. The city owns and operates the water works and electric-light plant. Metropolis is built on the site of old Fort Massac, which was settled about 1700 by French and Indians, but was not permanently inhabited until 1838; five years later it was incorporated. Pop., 1900, 4069; 1910, 4655.

METROPOLITAN (Lat. *metropolitānus*, MGk. μητροπολίτης, *metropolites*, from μητρόπολις, *metropolis*, a capital city, from μήτηρ, *mētēr*, mother + πόλις, *polis*, city). An ecclesiastical title, in modern times practically equivalent to archbishop (q.v.). It arose from the early custom of giving precedence to the bishop of the chief city or metropolis of a province. In some of the English colonies where the title of archbishop is not used by the Anglican church, that of metropolitan is applied to the chief bishop of a province. For the prerogatives of metropolitans in canon law, consult Owen, *Institutes of Canon Law* (London, 1884).

METROPOLITAN MUSEUM OF ART. The principal art museum of New York and the largest and most important in the United States. At a public meeting held Nov. 23, 1869, a committee of 50 was appointed to organize the project and raise an endowment of \$250,000. On Jan. 31, 1870, the first trustees and officers were elected with John Taylor Johnson as president. A charter was secured on April 13 of the same year. On April 5, 1871, a legislature, dominated by William H. Tweed, appropriated \$500,000 for a building in Central Park and defined the relation of the museum to the city. The earliest home of the museum (1871-73) was the Dodworth building, 681 Fifth Avenue, then the Douglas mansion, until the completion of the building in Central Park in 1879. The central portion of the Fifth Avenue front, after the designs of Richard Morris Hunt, was completed in 1902 at the cost of \$1,200,000 to the city. In

1904 a further appropriation of \$1,250,000 was made for the north part of the Fifth Avenue front, after the designs of McKim, Mead, and White. Further extensions were made under the law of 1907, authorizing the expenditure of \$750,000 a year for ten years. The new buildings are of classical design in light gray stone, and their total cost when completed is estimated at \$20,000,000. The museum is governed by a board of trustees, selected from certain of its fellows. The corporation is composed of fellows and members of various degrees, according to the amount of their yearly contribution, the total membership for 1914 being 3169. It is administered by a regular staff, composed of a director, secretary, treasurer, curators of the different departments and their assistants, and the librarian with staff. The cost of its administration in 1914 was \$461,555.39, to which the city contributed its yearly quota of \$200,000. The long administration of General di Cesnola (q.v.), as director (1879-1904), was conservative in character; but with the presidency of J. Pierpont Morgan (q.v.) (1904-13), a broad policy of expansion and popularization of the museum's activities began.

The art treasures of the museum, which are classified in different departments, form, with the loans exhibited, a collection of the first rank. The department of paintings is especially rich in Flemish, Dutch, Old English, French, and American masters. Its nucleus, a collection, chiefly of Dutch and Flemish masters, was acquired in 1871 for \$116,180.27. It was enriched by the Catherine Lorillard Wolfe Collection bequest of modern European paintings, with an endowment of \$200,000 for further purchases; the small but exceedingly valuable collections of old masters donated by Henry G. Marquand, second president of the museum; the Vanderbilt loan of 135 paintings of the last half of the nineteenth century, chiefly French (Barbizon) masters, made in 1902 but indefinitely renewed; the Hearn collection (1905), rich in American pictures, with funds aggregating \$250,000 for further purchases of American paintings; the Altman collection (see below); and the pictures bequeathed in 1915 by Mrs. Morris K. Jesup, with \$50,000 for maintenance and \$150,000 for the encouragement of American painting.

The most important feature of the department of classical art is the Cesnola collection of Cypriote antiquities, the largest and most important of its kind in the world, purchased in 1874 for the nominal sum of \$60,000. Among the other treasures of this department is an Etruscan bronze chariot of the sixth century B.C.; many Greek and Roman marbles and bronzes, including a remarkable statue of an Imperial prince of the Julio-Claudian family, a Greek work of the first century A.D., purchased in 1915; excellent collections of Greek terra cottas, vases, and ancient glass; and a splendid collection of Rodin's sculptures, donated chiefly by Thomas F. Ryan. The department includes also an important representative collection of Chinese paintings. The department of Egyptian antiquities, organized in 1906, has conducted many excavations at Lisht, Kharga, and Thebes, the results of which form a representative collection, especially rich in the art of the Middle Kingdom. The department of decorative arts, founded in 1910, is housed in a wing built especially for the purpose, in rooms chronologically arranged, with the remarkable Hoentschel

collection, donated and in part loaned by J. P. Morgan as its nucleus. It includes fine examples of sculpture, particularly of the French Gothic and the Italian Renaissance periods. The department of arms and armor was made one of the most important in the world by the acquisition of the William H. Riggs collection of mediaeval armor in 1914. The library, which occupies a wing especially built for this purpose, is one of the best art libraries in the United States, and contains 30,000 volumes and nearly 40,000 photographs and other reproductions, including 600 Japanese prints.

Besides the above, the museum has received other important legacies; including the John Crosby Brown collection of musical instruments in 1899; the Jacob H. Rogers bequest of about \$7,000,000 in 1901, for the purchase of art objects and books; the Heber Bishop collection of jade in 1902; an unconditional bequest of \$1,000,000 by Francis L. Leland in 1912; the Benjamin J. Altman (q.v.) collection, small, exceedingly good in quality, and especially rich in Dutch paintings, Italian sculpture, and Chinese porcelains. The museum also possesses an important collection of plaster casts of architectural and sculptural subjects. The museum organizes temporary exhibitions of importance, such as the Hudson-Fulton Memorial Exhibition of Dutch painting and early American art in 1909. It cooperates with the universities and public schools, offers lectures, and seeks in every way to promote the diffusion of art. After Mr. Morgan's death, Robert W. De Forest (q.v.) was elected president. The directors since General di Cesnola have been Sir Caspar Purdon Clarke (1905-10) and Edward Robison (1910-) (qq.v.). Consult: W. E. Howe, *A History of the Metropolitan Museum* (New York, 1913); the monthly *Bulletin*; and the various catalogues and handbooks of the different departments and collections published by the museum.

METRORRHAGIA. See MENSTRUATION.

METSU, mět'su, or **METZU**, GABRIEL (c.1630-67). A leading Dutch genre painter. He was born in Leyden in 1630, or possibly 1629, and is thought to have been a pupil of Gerard Dou. In 1648 he had acquired sufficient reputation to become one of the first members of the Painters' Guild of his native place, and between 1654 and 1657 he removed to Amsterdam, where he died in October, 1667. He painted scenes from the life of the burgher classes, although occasionally, in his market scenes and kitchen maids, he deals with humbler life. He also occasionally treated mythological and religious subjects, but with less success. In refinement of drawing and grace of expression he ranks among the best of the Dutch school. His pictures are characterized by smooth and polished technique, delicate treatment, and picturesque composition; they rarely contain more than three figures and have none of the boisterous action of Jan Steen; but the heads are animated and express cheerfulness and good humor; the color is clear and harmonious, with a tendency to coolness in his later work. Though often reminding us of one or another of his great contemporaries, Metsu's style always remained distinctly individual. His principal paintings include: "The Lady at the Harpsichord," in the Petit Palais, Paris; "The Music Lesson" and "Amsterdam Market," in the Louvre; "Music Lovers" and "The Mother with the Sick Child," in the Stiengracht collection at The Hague; "The Duet," in the National Gallery,

London; "The Sleeping Sportsman," in the Wallace collection, London; "The Music Lesson" (1659) and "A Visit to the Nursery," both in the Metropolitan Museum, New York; "Feast of the King of Beans," in which there is a touch of Jan Steen's humor, in the Pinakothek at Munich; "Old Poultry Peddler" (1662) and the "Young Woman Selling Poultry," both in the Dresden Gallery; "The Hay Barn," in the Johnson collection, Philadelphia. Consult: *Masters in Art*, vol. vii (Boston, 1906), containing an exhaustive bibliography; Hofstede de Groot, *Catalogue of Dutch Painters*, vol. i (London, 1908); Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (ib., 1909).

METSYS, QUINTEN. See MATSYS, QUINTEN.

METTERNICH, mët'tēr-nik, CLEMENS WENZEL NEPOMUK LOTHAR, PRINCE (1773-1859). An Austrian statesman. He was born at Coblenz, May 15, 1773, being the son of Franz Georg Karl, Count von Metternich, an Austrian diplomat and an associate of Kaunitz. Young Metternich was educated at the University of Strassburg, and afterward studied law at Mainz and traveled in England. In 1795 he married the granddaughter of Kaunitz, by whom he acquired large estates. His diplomatic career commenced at the Congress of Rastadt (1797-99), which he attended as representative of the Westphalian lordly houses. In 1801 he became Austrian Ambassador at Dresden, and two years later was appointed Ambassador to the Prussian court, where he negotiated the treaty of alliance between Austria, Prussia, and Russia against France in 1805. In 1806 he went as Ambassador to Paris. In 1809 he succeeded Count Stadion as Minister of Foreign Affairs, concluded the Treaty of Schönbrunn with France, and was instrumental in bringing about the marriage of the Archduchess Maria Louisa to Napoleon. He guided the course of Austria amid the difficulties of 1812-13. He maintained at first a temporizing policy and a scheme of armed mediation by Austria; but the arrogance of Napoleon's demands and the personal humiliations to which he was subjected at his famous interview with the French Emperor in Dresden in June, 1813, led him to resolve upon the declaration of war by Austria against France, and he subsequently conducted with great ability the negotiations which ended in the completion of the Quadruple Alliance. He was afterward employed in almost all the chief diplomatic affairs of that eventful time. With little concern for the cause of German nationality, which animated so largely the Prussians during the War of Liberation, Metternich during the last two years of Napoleon's power pursued a policy aiming at the advancement solely of Austrian interests. Fearing lest the defeat of France should raise up powerful rivals for Austria in Russia and Prussia, he exerted himself to preserve for France its ancient boundaries, pursuing that end ostensibly in order to preserve the balance of power in Europe. With masterly diplomacy he succeeded in imposing his policy on the allies, represented Austria in the Congress of Châtillon in February and March, 1814, and participated in the deliberations leading to the Treaty of Paris. In June he visited England and formed a new Quadruple Alliance for the preservation of the peace of Europe. As presiding officer of the Congress of Vienna he exercised a preponderating influence on the deliberations of that body, and succeeded in gaining for Austria a dominant

position among the Powers of Europe, with her interests supreme in Germany and Italy. After the Congress of Vienna he became the leading statesman of Europe, and the period 1815-48 is sometimes called the "Age of Metternich." He was the inspiring genius of the reactionary policy of the Restoration period. Crafty and cynical, having no sympathy with the aspirations of the people, his schemes were all directed to restoring the old order as far as possible. In 1821 he was made Austrian Chancellor. With his customary astuteness he made use of the Holy Alliance (q.v.), organized by Alexander of Russia to further the cause of Christian peace, as an instrument for the repression of all liberal or national movements. Under his inspiration congresses were held at Karlsbad (1819), Troppau (1820), Laibach (1821), and Verona (1822), at which action was taken against the Burschenschaft and the freedom of the press in Germany, the national movement in Italy, and the struggle for constitutionalism in Spain. He consistently opposed the Greek movement for independence, but there Russia refused to follow him. With time his influence over the French and Russian courts disappeared, but in Germany and Italy the reactionary policy of Metternich remained unabated until 1848. The revolutionary movement of that year, however, breaking forth with sudden violence, ended Metternich's system and caused the aged minister to flee from Austria (March, 1848) and to seek refuge in England and Belgium; nor did he return to Vienna till the end of 1851, when he received great marks of honor and favor from the Emperor; but, although sometimes consulted, he was never again asked to undertake the cares of office. He died at Vienna, June 11, 1859. His writings, under the title *Aus Metternichs nachgelassenen Papieren*, were published by his son, Prince Richard (8 vols., Vienna, 1880-84; in English translation under the title of *Memoirs*).

Bibliography. Albert Sorel, in *L'Europe et la révolution française*, gives a good sketch of Metternich and his political system. Consult also: writings by Friedrich von Gentz (q.v.); Gross-Hoffinger, *Fürst Metternich und das österreichische Staatssystem* (Leipzig, 1846); Beer, "Fürst Clemens Metternich," in *Der Neue Plutarch*, vol. v (ib., 1877); Wilhelm Oncken, *Oesterreich und Preussen im Befreiungskriege* (2 vols., Berlin, 1876-79); A. A. C. Sandeman, *Metternich, Life and Career* (ib., 1911); Oscar Browning, *History of the Modern World*, vol. i (London, 1912). See AUSTRIA-HUNGARY; VIENNA, CONGRESS OF; CARLSBAD DECREES.

METTEYA. See MAITREYA.

METTRAY, mët'rā'. A great agricultural and industrial colony (reformatory) at Mettray, near Tours, France, which has for years been looked upon as the model of all such institutions. It was founded in 1839 by Mettray Demetz and Bretignières de Courteilles, who had gotten their inspiration from America. The object was to keep young boys out of the regular prisons and to teach them, in addition to common school branches, trades and agriculture. Boys of the

better classes who are sent by their parents to the school are kept separately in the "maison paternelle" and spend their time in study. In 1899 the colony contained 450 boys. After the boys leave the institution a supervision is maintained over them. See *Bulletin de la commission pénitentiaire internationale* (Brussels and Bern, 1900).

METZ, mêts. A town and first-class fortress in Alsace-Lorraine, Germany, capital of the District of Lorraine, situated at the confluence of the Seille with the Moselle, about 11 miles east of the French frontier and 66 miles by rail south-southwest of Treves (Map: Germany, B 4). It is built partly between the two rivers and partly on islands of the Moselle. The streets bear both German and French names. The older section is irregularly constructed and is ancient in appearance. In the southwestern portion of the town is a splendid esplanade with statues of Marshal Ney, Prince Frederick Charles, Emperor William I, and Emperor Frederick (1909), and a fine fountain. The magnificent Gothic cathedral, the finest structure in the town, was begun in the thirteenth century. It was consecrated in 1546 and is now being restored. It has numerous fine specimens of stained glass and is surmounted by a tower 387 feet high. The church of St. Vincent, a fine Gothic structure of the thirteenth century, the garrison church, and the church of St. Constance, with frescoes, are also of architectural interest. Among the secular buildings may be mentioned the palace of justice, the town hall, the theatre, the barracks, and the Central Railway Station, completed in 1908.

The educational institutions include a Gymnasium, a Realschule, a seminary for priests and for teachers, schools of art and music, and a military school. The municipal library of 100,950 volumes in 1913 is rich in works relating to the history of Metz, and the municipal museum contains collections of coins and paintings and of antiquities found in the vicinity. Metz has lost somewhat in industrial importance since its occupation by the Germans, the French having withdrawn a large amount of capital. The chief manufactured products are leather and leather goods, arms, hats, artificial flowers, coarse cloth, preserves, etc. The trade is chiefly in the agricultural products of the surrounding country.

The city is regarded as one of the best-fortified places in Europe. Its fortifications, extending along the Moselle and the Seille, consist of works begun by the French and completed by the Germans, and of works built entirely by the conquerors. Some portions of the old fortifications have also been retained. Pop., 1890, 60,186; 1900, 58,424, part of the troops having been withdrawn; 1910, 68,598, including the garrison of nearly 25,000 men. The civil population is almost entirely Roman Catholic.

Metz was known to the Gauls as Divodurum and in mediæval times as Metac. By the Treaty of Mersen (870) the city fell to East Francia (later Germany) and rapidly attained importance, so that in the thirteenth century it became a free Imperial city. It was here that Charles IV in 1356 proclaimed the Golden Bull. Metz became involved in many conflicts with Lorraine, and in the period of the Reformation the city was a centre of disturbance. In 1552 it was handed over to Henry II of France, together with Toul and Verdun, by the Protestant

lords in order to gain French aid against Charles V. (See MAURICE OF SAXONY.) The latter besieged the city in vain, and the Peace of Westphalia (1648) confirmed France in possession of the city. Metz was henceforth chiefly important as a strong fortress, and played a prominent rôle in the campaigns of 1814 and 1815 against Napoleon and again in the Franco-German War. As a result of the battles of Colombey-Nouilly, Mars-la-Tour, and Gravelotte (see FRANCO-GERMAN WAR), the German army occupied the city on Oct. 29, 1870, and the Peace of Frankfort gave Metz to Germany. In the European War which broke out in 1914 the German communications with Metz were the objective of several French offensive movements. It was also attacked by the allied aerial fleets. See WAR IN EUROPE. Consult: F. D. H. Klipffel, *Metz, cité épiscopale et impériale* (Brussels, 1867); G. T. Robinson, *The Fall of Metz* (London, 1871); Westphale, *Geschichte der Stadt Metz* (3 vols., Metz, 1875-78); F. Du Val des Bois, *Au pays de Metz* (Paris, 1886); Gustave Marchel, *La France moderne, le drame de Metz* (ib., 1890); E. F. Biskamp, *Das mainzer Domkapitel bis zum Ausgang des 13. Jahrhunderts* (Marburg, 1909).

METZINGER, LÉON (1842-1914). A French general, born at Dijon. He graduated from the military school of St. Cyr in 1863. From 1898 to 1903 he was commander of the Fifteenth Army Corps and then until his retirement in 1907 he served as general of division and member of the Superior Council of War. He received the grand cross of the Legion of Honor. During his 50 years of service he took part in 15 campaigns and was at the sieges of Hué and Tananarive. To *L'Echo de Paris* he contributed a number of articles on the reorganization of the army.

MET'ZU. See METSU.

MEUDON, mē'dōn'. A town in the Department of Seine-et-Oise, France, in the southwestern outskirts of Paris (Map: France, N., A 2). Its château, fitted up by Napoleon for Maria Louisa in 1812, was almost destroyed during the bombardment by the Germans in 1871; it has been partly restored. The church contains a statue of Rabelais, who was curé of Meudon. It has an observatory, a splendid orphan asylum, founded by the Duchess Galliera, and a school of military aviation. The forest near by is a favorite holiday resort. Meudon's manufactures comprise glass, chalk, linen, whiting, buttons, and ammunition. Rodin the sculptor located his studio here, and here was finished some of his most famous work. Pop. (commune), 1901, 9702; 1911, 12,292.

MEULEN, mē'len, ADAM FRANS VAN DER (1632-90). A Flemish battle painter, born at Brussels. He was a pupil of Peter Snayers, but afterward went to France on the invitation of Lebrun and was made Louis XIV's court painter (1666). During the war in Flanders he accompanied the King and painted pictures of the battles and sieges in which he was engaged. These are remarkable for the care bestowed upon historical detail and the numerous portraits of contemporaries contained in them. There are a number of them in the Louvre and at Versailles and two in the Metropolitan Museum, New York. He also designed cartoons for the Gobelins.

MEUMANN, moi'män, ERNST (1862-1915). A German psychologist and educator. He was privat docent in philosophy at Leipzig (1894), associate professor (1897) and professor of

psychology and pedagogy at Zurich (1900), professor of philosophy at Königsberg (1905), at Münster (1907), at Halle (1909), at Leipzig (1910), and professor of philosophy and pedagogy at the Kolonialinstitut in Hamburg (1911). He was early known for his investigations in psychology, especially in the fields of rhythm and the perception of time; but his greatest reputation is as the founder and systematizer of modern experimental pedagogy. He became editor of the *Zeitschrift für experimentelle Pädagogik*, of *Pädagogische Monographien*, and of *Die Psychologie in Einzeldarstellungen* and coeditor of the *Archiv für die gesamte Psychologie*. Besides numerous articles he wrote: *Die Oekonomie und Technik des Lernens* (1903; 3d ed., 1912; Eng. trans., *The Psychology of Learning*, 1913); *Vorlesungen zur Einführung in die experimentelle Pädagogik* (2 vols., 1907; vol. iii, 1914); *Intelligenz und Wille* (1908; 2d ed., 1913); *Einführung in die Aesthetik der Gegenwart* (1908); *System der Aesthetik* (1914); *Abriß der experimentellen Pädagogik* (1914).

MEUNG, mēn, JEAN DE (c.1250-?). A French poet, also called Jean Clopinel. He was born at Meung-sur-Loire and died at the beginning of the fourteenth century. Not much is known about his early life, but it is assumed that he studied at the University of Paris. His literary fame rests chiefly on his addition to the *Roman de la rose* (q.v.) of Guillaume de Lorris (q.v.). The poem, as Guillaume de Lorris left it, comprised about 4000 verses. Jean de Meung added about 18,000, of which 12,000 can be found in the authors of whom he was especially fond—notably 2000 from Ovid alone. Ostensibly continuing the allegory of his predecessor, who intended to make it a poem of chivalry, Jean de Meung in reality introduced quite a different spirit and made the allegory a mere cloak for telling stories and indulging in political and moral satire. At the request of King Philippe he translated the *Consolatio* of Boëthius into prose and verse. Towards the end of his life he wrote his *Testament*, in which, although praising sincere piety, he pours bitter sarcasm on monks. Consult: Paris, "Jean de Meung," in the *Histoire littéraire de la France*, vol. xxviii (Paris, 1840); Quicherat, "Jean de Meung et sa maison à Paris," in the *Bibliothèque de l'Ecole des Chartres* (ib., 1880); Langlois, *Origines et sources du Roman de la rose* (ib., 1890).

MEUNIER, mē'nyā', CONSTANTIN (1831-1905). The foremost among modern Belgian sculptors; also a painter of note. He was born April 12, 1831, at Etterbeek, near Brussels, studied sculpture at the Brussels Academy and later under Fraikin, and then took up painting under Navez. He first devoted himself to religious and historical subjects, such as "The Burial of a Trappist" (Courtrai Museum), "The Stoning of St. Stephen" (Ghent Museum), and "The Peasants' War" (1875, Modern Gallery, Brussels), which he rendered with almost brutal realism. From these he turned to the study of the workers in the mining and industrial regions of Belgium, the first fruits of which were "The Broken Crucible" (1880) and "The Descent of the Miners." Thereafter his life was dedicated to what others have called the "aesthetics of work," interrupted only by a trip to Spain in 1882-83 and by his duties as professor of painting at the Louvain Academy (1886-94). It was above all the monumental plastic qualities

of the laborer which appealed to him; therefore it came about that when past 50 he turned again to sculpture and attained in this medium his greatest results. His works have been termed "hymns to labor." They are full of lyric power and vigorous rhythmic movement; the execution is sincere and forceful, though often neglectful of detail. Meunier depicts the struggle of man with the earth, the tragedy rather more than the grandeur and beauty of labor; his art is deep and intensely human. The first of his great typical figures of laborers were "The Hammerman" (1884) and "Puddler Resting" (1885). Other celebrated ones are "The Dock Hand" (Luxembourg), "The Sower" (Botanical Garden, Brussels), and "The Mine Girl." The statuette "Old Mine Horse," the group "Mine Damp" (Brussels Gallery), the equestrian group "At the Watering Place" (Square Ambiorix, Brussels), the relief "Puddlers" (Luxembourg), and the monument to Father Damien, at Louvain, are also fine examples of his work. On the death of his two sons he had returned for a time to religious subjects, producing the "Prodigal Son" (1895, Berlin Gallery), "Ecce Homo," and "Pietà." His crowning achievement, however, is the splendid unfinished "Monument to Labor," purchased by the state for the Brussels Gallery. Four reliefs, entitled "Industry," "The Harvest," "The Port," and "The Mine," are inserted in the sides; the whole is surmounted by the figure "The Sower"; and other figures are about the base. Exhibitions of Meunier's works have been frequently held throughout Europe, and in 1913-14 in America. Meunier died April 4, 1905, at Brussels, where he had lived since leaving Louvain in 1894. Consult: Camille Lemonnier, *Constantin Meunier, sculpteur et peintre* (Paris, 1904); Walther Gensel, *Constantin Meunier* (Bielefeld, 1905); Christian Brinton, *Catalogue of the American exhibition* (New York, 1914); W. O. Partridge, "Meunier the Belgian Sculptor," in *Homiletic Review*, vol. lxviii (ib., 1914).

MEUNIER, (ETIENNE) STANISLAS (1843-). A French geologist, born in Paris and educated there in the Faculty of Sciences. He became a doctor of science in 1869, was made laureate of the Academy of Sciences in 1878, and in 1892 was appointed professor of geology at the National Museum of Natural History. He was created a Knight of the Legion of Honor and served as vice president of the Geological Society of France. His writings include: *Etude descriptive sur les météorites* (1867); *Lithologie terrestre et comparée* (1870); *Le ciel géologique* (1871); *Géologie des environs de Paris* (1875; new rev. ed., 1912); *Les causes actuelles en géologie* (1879); *Excursions géologiques à travers la France* (1882); *Météorites* (1884); *Géologie régionale de France* (1889); *La géologie comparée* (1895); *Nos terrains: géologie populaire* (1898); *La géologie générale* (1903); *La géologie expérimentale* (1904); *Catalogue de la collection de géologie expérimentale du muséum* (1907); *Les convulsions de l'écorce terrestre* (1910).

MEURICE, mē'rēs', FRANÇOIS PAUL (1820-1905). A French dramatist, born in Paris and educated at the Collège Charlemagne. In 1842 he prepared a version of *Falstaff* for the Odéon with Vacquerie, presented at the same theatre in 1843. With the same collaborator he produced *Le capitaine Paroles* and an imitation of *Antigone* (1844), and he assisted Dumas in a

metrical translation of *Hamlet*, which was given at the Théâtre Historique in 1847. The following year he became chief editor of Victor Hugo's *L'Événement*, to whose cause Meurice was so devoted that he suffered nine months' imprisonment (1851), but in 1869 he aided in starting a new journal with the same motive, *Le Rappel*, and he was intrusted by Hugo himself with the publication of his complete works (46 vols., 1880-85). Meurice dramatized several of them, as well as a number of George Sand's novels, and his other plays include: *Benvenuto Cellini* (1852; new ed., 1891); *Schamyl* (1854); *L'Avocat des pauvres* (1856); *Fanfan la tulipe* (1858); *La vie nouvelle* (1867); *Cadio* (1868); an adaptation of the *Midsummer Night's Dream* (1886); *Struensee* (1898), crowned by the Academy. Meurice also wrote romances, such as *La famille Aubry* (1854), *Césara* (1869), and *Le songe de l'amour* (1869).

MEURSIUS, mēr'si-us (VAN MEURS), JOHANNES (1579-1639). A Dutch classical scholar and historian, born at Loosduinen, near The Hague. At the age of 16 he finished a commentary on the *Cassandra* of Lycophron. He traveled much and in 1610 was appointed professor of Greek and history at Leyden. Later the political disturbances in his country and the execution of Jan Barneveldt, to whose sons he had once been tutor, exposed him to considerable persecution and cost him the high favor which he had once enjoyed. Hence he left Holland and in 1625 accepted a position at the Academy of Sorö in Denmark, where he spent the remainder of his life. His published works include many editions of Greek authors, Lycophron, Apollonius Dyscolos, Philostratus, Procopius, and others. His numerous treatises on Greek literature are mostly reprinted in J. F. Gronovius' *Thesaurus Antiquitatum Græcarum*. His *Glossarium Græco-Barbarum* (1614) and *Athenæ Batavæ* (1625) also deserve mention. His complete works were edited in 12 volumes by Lami (Florence, 1741-63). Consult Van der Aa, *Biographisch Woordenboek der Nederlanden* (Amsterdam, 1869), and J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

MEURTHE-ET-MOSELLE, mērt'-â-mô-zél'. A frontier department in the northeast of France, part of the old Province of Lorraine, and composed of the remnants of the departments of Meurthe and Moselle which remained to France after the Treaty of Frankfort, 1871 (Map: France, N., M 4). Area, 2039 square miles. Pop., 1911, 564,730. It is named from the principal rivers which traverse the department. The surface is diversified and picturesque, the east border being marked by the wooded Vosges Mountains, which attain a maximum altitude of 2041 feet. Iron, copper, lead, rock salt, gypsum, and building stone are the chief mineral products; and the fertile soil yields abundant crops of cereals, hops, tobacco, beet-root, and a variety of fruits. There are manufactures of steel, iron, railway materials, hats, soap, matches, textiles, pottery, glass, paper, chemicals, wine, and beer. Capital, Nancy. Chief towns, Lunéville, Toul, and Longwy. The Department of Meurthe-et-Moselle was the scene of almost continuous fighting during the European War which began in 1914. See WAR IN EUROPE.

MEUSE, mēz. A frontier department in the northeast of France, part of the ancient Province of Lorraine, bordered on the north by Bel-

gium (Map: France, N., L 4). Area, 2409 square miles. Pop., 1911, 277,955. It is traversed from southeast to northwest by the valley of the Meuse, flanked by the wooded Argonne hills and the Côtes de Meuse, also the rivers Orne and Chiers. The entire department is a highland, well forested, with fertile valleys producing wheat, oats, rye, barley, potatoes, and hemp; grapes are grown for wine, and the beet-root for sugar. It has minor manufactures of iron and steel instruments, textiles, lumber, leather, glass, and paper. Meuse was the scene of heavy fighting during the European War, which began in 1914 (see WAR IN EUROPE). Capital, Bar-le-Duc.

MEUSE, mēz, or **MAAS**, mās. One of the principal rivers of western Europe. It rises on the Plateau of Langres in the Department of Haute-Marne, northeast France, and flows at first north through a narrow, winding valley with high and steep sides, sometimes becoming cañon-like with rocky cliffs, and through the wild forest region of Ardennes (Map: France, N., L 4). It then flows northeast through Belgium into Holland, the land becoming gradually lower, changing through the heath lands of north Belgium to the extensive peat bogs known as De Peel in southeast Holland. Finally the river turns westward, joins the Waal, one of the arms of the Rhine, opposite Gorkum, and empties into the North Sea through the great delta common to the two rivers, a large, compound estuary consisting of broad, sandy, and shallow channels inclosing a number of low, flat islands. The united Meuse and Waal first divide into two arms, one of which, the Hollandsch Diep, flows southwest and, after communicating southward with the delta of the Scheldt (q.v.), enters the sea through the broad Haringvliet. The other arm flows west and again divides into the Old and the New Meuse, which, uniting at several points, flow parallel to the sea. The Old Meuse communicates by side channels with the Haringvliet, and the New Meuse receives the Lek, an arm of the Rhine. The New Meuse, which passes Rotterdam, is the main channel for navigation. The total length of the Meuse is 498 miles and it is navigable for 355 miles. Its upper reaches are connected by canal with the Saône, forming the Canal de l'Est, which gives France a waterway north and south along the east frontier. Its principal tributaries are the Sambre from the left and the Semoy, Ourthe, and Roer from the right. It connects with extensive canal systems in Belgium and in Holland. Above Neufchâteau, in the Department of Vosges, the river loses itself underground for some miles. The chief cities on its banks are Verdun (the head of navigation), Sedan, and Charleville in France; Namur and Liège in Belgium; and Maastricht, Dordrecht, and Rotterdam in Holland. The line of this valley was followed by part of the German army, the Army of the Meuse, in its invasion of Belgium and France in 1914. This valley is not only the shortest route from Berlin to Paris, but also the easiest as far as natural conditions are concerned. The region between the Meuse and the Moselle was almost completely devastated during the struggle between the Germans and the allies in 1914. See WAR IN EUROPE. Consult W. M. Davis, "The Seine, the Meuse, and the Moselle," in *Geographical Essays* (Boston, 1909).

MEW, or **SEA MEW**. In Great Britain, a gull (q.v.).

MEWAR. See UDAIPUR.

MEWS, PETER (1619-1706). An English bishop and royalist. He was born near Sherborne, Dorsetshire, and was educated at the Merchant Taylors' School and at St. John's College, Oxford. When the Civil War broke out he joined the King's forces in 1642; was promoted to captain; was captured at Naseby; and upon his release retired to Holland in 1648. During the Protectorate he undertook two different missions to Scotland in behalf of the royalists. After the Restoration he resumed his fellowship at Oxford; became chaplain to the King; and was president of St. John's College, Oxford, in 1667-73, and vice chancellor of the university in 1669-73. He was appointed Bishop of Bath and Wells in 1672, and was elected Bishop of Winchester in 1684. He upheld the opposition of the fellows of Magdalen College to James II in 1688, and in 1689 swore allegiance to William and Mary.

MEXBOROUGH, mēks'būr-ō. A town and urban district in the West Riding of Yorkshire, England, on the Don, 5 miles northeast of Rotherham. It has large iron, glass, and pottery industries. The markets are municipal property. Pop., 1901, 10,430; 1911, 14,401.

MEXCALA, mēs-kā'lā. A river of Mexico. See MESCALA.

MEXIA. A city in Limestone Co., Texas, 40 miles northeast of Waco, on the Houston and Texas Central and the Trinity and Brazos Valley railroads (Map: Texas, D 4). It is in a natural-gas and oil region and has oil mills, ice plant, cotton mills, and a broom factory. Cotton, corn, and oats are raised extensively. The city contains a city hall and a public library, and shops of the Houston and Texas Central System. Mexia has adopted the commission form of government. Pop., 1900, 2393; 1910, 2694.

MEXICAN ARCHÆOLOGY. Among the many tribes which occupied Mexico in former times six may be said to have attained a considerable degree of culture. The Nahuas, whose chief seat at the time of the Spanish Conquest was in the valley of Mexico, had come from the north, and their influence extended, by reason of conquest and migration, southward as far as Costa Rica. It is impossible to state the exact limits of Nahuatl remains in Mexico, owing to our meagre knowledge of the antiquities of certain parts of the country and the confused traditions of the migrations of the people. The Tarascans were settled in what is now Michoacan, the Mixtecs and Zapotecs in Oaxaca, and the Huastecs, linguistically a branch of the great Maya-Quiché family, in northern Vera Cruz. The Totonacs, whose territory lay between that of the Huastecs and Nahuas, had a distinct culture, although undoubtedly influenced by both of the former peoples. To the east of the Isthmus of Tehuantepec, and extending eastward over the states of Chiapas, Tabasco, and Yucatan, and southward through Guatemala to northern Honduras, are the remains of the Maya-Quiché family, whose civilization was in many respects the most advanced in ancient America. This region is geographically as well as culturally a part of Central America.

The remains found in Chihuahua show an ancient culture similar to that which existed in the valleys of the Gila and Salt rivers in Arizona, but of a slightly higher grade. The people seem to have reached an intermediate

stage between the Nahuas on the south and the Pueblo peoples on the north, but nearer the latter than the former. In this region the ruins of Casas Grandes (q.v.) are the only noteworthy group. The pottery from the vicinity of this ruin is of an advanced type and somewhat resembles the ceramics of Arizona and New Mexico, but it has distinct peculiarities and bears the marks of contact with the people of the south. In the dense forests of the State of Tamaulipas, on the coast of the Gulf of Mexico, ruins have been reported which are related to the culture of the south, and probably belong to the Huastec or Totonac peoples. The northernmost great ruin belonging to the high culture of central Mexico is La Quemada in Zacatecas, an immense structure that has been but little studied. The ceramic art of these and other neighboring sites is peculiar and represents a number of superimposed styles. In Michoacan the Tarascan ruins of Tzintzuntzan bear some resemblance to those of La Quemada. This region of the Tarascos has been little explored. The great ruins of the Nahuas include Tula, Teotihuacan, Xochicalco, Tepoztlan, Cholula, and Tenochtitlan, now the city of Mexico. The last named was the capital of the Aztecs, the predominant branch of the Nahuas, at the time of the Conquest. It was founded in 1325 and was leveled to the ground by Cortés in 1521. Underground in the city of Mexico are buried a vast number of objects that excavations constantly bring to light. The famous sacrificial stone and calendar stone were uncovered in 1790 by accident near the site where they had formerly been placed in the ceremonial centre of the Aztec capital. In the Huastecan and Totonacan districts are the ruins of Papantla, Misantla, Centla, Tusapan, and Cempoalla; while in the State of Oaxaca, Monte Alban, the ancient capital of the Zapotecs, is one of the most stupendous ruins in Mexico. Mitla, in the same district, belongs to a different style and a later period. In the Maya region are the remains of hundreds of cities, the most important of which are Palenque, Naranjo, Piedras Negras, Menché, Seibal, Tikal, Labna, Kabah, Uxmal, Chichén-Itzá, Quirigua, and Copan.

In the arts the ancient Mexicans show a surprising progress. For the architecture of ancient Mexico, see ARCHÆOLOGY, AMERICAN; MITLA; PALENQUE.

Sculptures in stone are found, ranging in size from the small amulets, representing deities, and designed as personal ornaments, to monuments of colossal size, such as the so-called Mexican calendar stone and the great stela of the ruins of Quirigua. In wood carving the Mexicans displayed even greater skill than in the working of stone. The famous zapoteco-wood lintels of Tikal, the wooden drums, and the atlatis, or throwing sticks, splendidly carved and in some instances covered with gold leaf, attest their proficiency in this branch of art. Carving, whether in stone, wood, bone, or shell, was done with stone or copper tools. Jadeite, emerald, rock crystal, turquoise, and serpentine were carved into numberless varieties of personal ornaments, chiefly in the territory of the Mixtecs and Zapotecs of Oaxaca, and by the Mayas in the mountainous parts of Chiapas. The Nahuas and Zapotecs fashioned mosaics on wood, shell, and clay, using bits of shell, jadeite, turquoise, obsidian, mother-of-pearl, and hematite to form the designs.

In the ceramic art the products of the several civilized nations are distinct, and we may determine their provenance with a certain amount of exactness. We must take account of the historical succession of different styles in any one locality, as will be explained presently. The terra-cotta figures of the Jalisco district, the ware from the vicinity of Cholula, the funeral urns from the Oaxaca valley, and the pottery from the Maya region are characteristics of each centre. In metallurgy we find the ancient Tarascos, the Aztecs, Totonacs, Mixtecs, and Zapotecs were very skillful in the manipulation of copper into axes, tweezers, rings, rattles, and bells. Beautiful objects of gold have been found in the Matlaltzineca region near Toluca and in the Mixtecan and Zapotecan areas, which are the very highest achievement of the ancient American goldsmiths. Ear, nose, and lip ornaments, beautiful bells, some representing symbolic faces and animals' heads, beads, circular breastplates, the copilli or crown of rulers, and even remains of armor made of the precious metal have been found in ancient graves during recent years. Unfortunately the greater part of these finds go to the melting pot.

The ancient Mexicans believed in a future life which was graded according to the manner of death, and among the Zapotecs they had elaborate funeral ceremonies and sacrificed slaves to assist the shades of important persons on their journey to paradise. They had greater and lesser deities. The principal god of the Aztecs was Teotl, who was worshiped as a supreme being. Next to Teotl, Tezcatlipoca, a wizard god, was venerated as the soul of the world, who rewarded the righteous and punished the unrighteous. The great beneficent god was Quetzalcoatl among the Nahuas, called Kukulcan by the Mayas, the great feathered serpent deity. He seems to have been an early Maya god taken over by the Nahua at a time when they were profoundly influenced by the ascendant Maya civilization. He invented the arts and taught the people wisdom by his laws. According to his various attributes he appears under different names, as do many other gods of the Mexican pantheon. Tlaloc was the god of rain, and among the Aztecs, Huizilopochtli, the terrible war god, was patron and protector. There were gods of the hunt and chase, of play, flowers, wine, merchants, trickery, lust, and so forth, while each trade and occupation had its own patron deity. The religious rites were elaborate and prescribed with minuteness. The multiplicity of gods required a great number of priests and priestesses, who were almost as highly venerated as the deities they served. There were degrees of priesthood and religious orders and fixed and movable festivals. The great teocallis, or god houses, were commanding edifices of stone, built on high truncated pyramids with annexed buildings. Their idols were many and hideous, smeared with the blood of human and animal sacrifices.

Among certain of these civilized tribes we find artificial flattening of the head; also trepanation, and decoration of the teeth by filing and interlaying with certain stones, such as jadeite, turquoise, obsidian, hematite, and rock crystal. Labrets, or lip ornaments, made of obsidian and gold, were inserted in holes in the lower lip; U-shaped ornaments of obsidian and shell were hung from the nose, and large ornaments were inserted in incisions in the ears. Many of

the musical instruments are still extant, and we find in various museums examples of the teponoztli, the horizontal drum, made from a log of wood hollowed out on the under surface and having two tongues cut on the upper one, which were beaten with rubber-tipped sticks. Among the instruments were the upright drum, of a hollowed log of wood, with skin-covered top, beaten with the hands; flageolets, whistles, and rattles of clay; trumpets; and rattles of shell and notched human bones from the arm or leg, rasped with a bone or shell. Painting was another art in which the ancient Mexicans had made remarkable progress. This is shown by the mural paintings of Teotihuacan, Mitla, Chichén-Itzá, and Santo Rita. One of the most important sources of information for the study of ancient Mexico is found in the existing pictorial and hieroglyphic codices, or books. As is well known, several of the tribes of Mexico had attained a degree of culture at the time of the Spanish Conquest that led to the recording of events, not only on stone bas-reliefs and sculptures, but on material of a more perishable nature. These codices were on strips of deerskin, the surface of which was covered with a thin coating of stucco. They were folded screen fashion, and the paintings were on both sides. The Mexicans had furthermore invented a kind of paper. In Mexico proper, in addition to bark paper, a paper was made from the leaves of the maguey plant, *Agave americana*; this paper they also sized with a coating of lime.

One of the things which impressed Cortés, when he first came in contact with the messengers sent out by Montezuma, was that some of them were busily employed in making paintings of the Spaniards; their costumes, arms, and different objects of interest giving to each its appropriate color. These paintings were to convey to Montezuma an idea of the conquerors in picture writing, and are the first notice we have of its existence in ancient America. In symbolic and picture writing the Mayas approached very closely to phoneticism, and recent progress has been made in an interpretation of the codices of the Nahua and Mixtec group, as well as signal success in the decipherment of the hieroglyphics of the Mayas, preserved in codices, tablets, and stelæ. Of the latter class of inscriptions certain dates and methods of counting have been worked out, and in some instances about 40 per cent of the inscriptions have been successfully deciphered. Besides the two known systems of pictographic and hieroglyphic writing explorations in Oaxaca have recently revealed a third and distinct form of inscription among the Zapotecs.

The complex calendar system of the Tarascos, Nahuas, Mixtecs, Zapotecs, Totonacs, and Mayas is the same and is a remarkable evidence of the high culture which they had attained, but the Mayas had more extended measures for the computation of time than the Nahuas. Recent investigation of the Maya calendar revealed various periods and elaborate computations and a knowledge of the movements of certain planets. The year was divided into 18 months of 20 days each plus 5 days added after the last month to round out the true solar year. Each of the 20-day periods had its own name and symbol, but the days were not numbered from 1 to 20, but from 1 to 13. By this method of numeration the day bearing the same name and number did not recur until the 13 months had elapsed; this made a period of 260 days, which, among the

Aztecs, was called Tonalamatl; it was a year within a year and was used for divinatory or religious purposes. There were, also, many other intricacies in the Mexican calendar, some of which have not yet been explained.

Pre-Columbian history has been restored in the rough over most of Mexico and Central America, and in some regions, particularly among the Maya, the dating of sculptures and structures seems to be upon a very exact basis. The style of sculpture in the monolithic monuments and the mechanics of masonry in the stone temples pass through a natural development in which successive improvements give a test of age. The native dates inscribed on many of the ancient monuments of Yucatan, Guatemala, and Honduras agree with the positions of the monuments according to the tests of age given above. It was long thought impossible to correlate these dates with the European calendar because the fashion of counting time had changed somewhat before the coming of the Spaniards and the cities where the old-style dates occurred were not mentioned in extant traditions, although the history in the Maya Chronicles, or Books of Chilán Balam, extended back to almost the time of Christ. But an old-style date was found at Chichén-Itzá, a city prominent in these chronicles, and this date had to be placed in one of the known occupations of the site. There was only one date that fitted the conditions and this fortunately fitted very nicely the mass of traditions, the other inscriptions, and the theoretic arrangements according to style.

The earliest Maya cities were in the southern part of the area. Copan and Tikal show many archaic monuments as well as others that run the gamut of change towards the higher products. Quirigua, Seibal, Yaxchilan, and Piedras Negras offer examples of more finished work of what we may call the Great period. Architecture did not begin to develop as soon as sculpture and it was many centuries before some of the best features were accomplished. In fact the finest buildings date from a sort of renaissance that took place in northern Yucatan after all the early cities of the south had been abandoned. Labna, Kabah, Uxmal, and Chichén-Itzá afford many beautiful examples of late architecture. Finally, there was a short period when conquerors from the highlands of Mexico held Chichén-Itzá and after this a complete breaking down of the Maya political structure. Mayapan was the last great Maya city to be abandoned, in 1442. Learning was still maintained by means of books when the Spaniards arrived. The historical periods as determined by the monuments and chronicles are as follows:

- Protohistoric period, before 160 A.D.
- Archaic period, 160 A.D. to 455 A.D.
- Great period, 455 A.D. to 600 A.D.
- Transition period, 600 A.D. to 960 A.D.
- League period, 960 A.D. to 1195 A.D.
- Nahua period, 1195 A.D. to 1442 A.D.
- Modern period, after 1442 A.D.

Traditional history on the highlands of Mexico is very complete for a short time before the coming of the Spaniards, but does not go back nearly so far as in Yucatan. The system of keeping time records brought confusion if the count ran into many of the 52 year cycles. Fairly accurate history extends back to 1200 A.D. and more or less legendary history for several centuries earlier.

In 1910 an actual stratification of archæological remains, mostly ceramic, was located in the valley of Mexico, the depth of the deposit arguing great age. At the bottom in a thick layer were many examples of a peculiar type of figurine that has since been found to have a very wide distribution over Mexico and Central America. It occurs over the greater part of central Mexico and reappears in parts of Guatemala and Salvador in identical form. Somewhat modified, this type of figurines may be traced through Nicaragua into Costa Rica. Since the Nahua tribes are the only ones common to all these regions there is little doubt that they were the originators and carriers of this art. In some regions, at least, this crude ceramic art is earlier than the known beginnings of Maya sculpture in stone. In the stratifications referred to above the archaic layer is topped by a thick stratum showing finely modeled figurines and richly painted vases. This second layer might perhaps be called Toltec, although this term has fallen into disrepute. Maya influence is strong in this second layer, which may extend in time from about 400 A.D. forward for six or eight centuries. There is reason to believe that the period of greatest extension of high culture towards the north, seen at La Quemada, etc., came near the end of this Toltec period, or from 1000 to 1200 A.D., which also boasted such Imperial centres as Teotihuacan, Tula, and Cholula. On the surface is a shallow layer that corresponds to the post-Toltec or Aztec culture. Although the Aztec capital was not itself founded till 1325 it is reasonable to suppose that the civilization of which it was the supreme example was already established. This late Mexican culture was doubtless a direct outgrowth of the more brilliant one of the Toltecs, who were possibly of the Nahua stock. In Zapotecan ruins we can likewise discern a chronological sequence. Monte Alban belongs to an earlier era than Mitla. This important question of primitive history is now engrossing the attention of Mexican and Central American archæologists.

MEXICAN LITERATURE. Modern Mexico, despite the surprising advance of the past quarter century, has been so far outstripped in the material elements of civilization that the people of more progressive nations are apt to forget the time when its capital was the intellectual and artistic centre of the New World. The intellectual life of Mexico, therefore, is not of modern creation, but dates back to the third decade of the sixteenth century, which the early *conquistadores* marked by the introduction by Viceroy Antonio de Mendoza, in 1535, of the first printing press, to be followed shortly, late in 1551, by the establishment of the second university upon the American continent. That neither of these establishments was a matter of mere formal enactment is shown by the creditable list of the writers of that century who were connected as teachers or pupils with the early educational institutions and whose works bear the imprint of the native Mexican press, whose list of extant works printed before 1600 embraces some 116 titles. (J. García Icazbalceta, *Bibliografía mexicana del siglo XVI*, Mexico, 1886.)

Any study of Mexican literature naturally begins with the few survivals of primitive picture writing. These hieroglyphs so far approached writing as to give clearly names, places, and the date of events—some of which are accurate—as far as the twelfth century, while more vague traditions extend several centuries further back. Most of these records belong to that aboriginal branch of Nahuatl stock known as the Toltecs, but the famous *Popul-Vuh*, of Quiché origin, also mentions names and places of Mexican legendary history. The meagre details of these records were supplemented, within a century after the Spanish Conquest, by so-called histories, written by educated natives from the above sources, aided by oral tradition. These works consist of songs, ordinances, memoirs of the native kings, and accounts of the Spanish conquerors. Without them it would now be impossible to read the few extant sources; and if some of the early Church fathers are to be blamed for their fanaticism in destroying hieroglyphs, others deserve equal credit for their care in preserving the remaining few and in training natives who could still unravel their meaning.

Most writers of the early colonial period were natives of the Old World, whom matters of

church or state called to the New. Among those works of the sixteenth century which relate to early native history we may mention Motolinía's *Historia de los Indios de la Nueva España* (1541), Sahagún's *Historia de las cosas antiguas de los Indios* (1566), and Molina's *Vocabulario* (1555), a Castilian-Mexican work of 249 pages, one of the products of Juan Pablo's first printing press. The work of these men was largely utilized by Torquemada in his *Monarquía Indiana* (1615), a work for which Alamán bestows upon him the title "the Livy of New Spain." Above the names of the adopted European chroniclers stand those of Tezozomoc, son of the last Mexican Emperor, Cuitlahuac, whose *Crónica Mexicana* (c.1600) is an admirable companion volume to Friar Diego Durán's *Historia de los Indios de Nueva España y islas de tierra firme* (1581), up to that time the most complete chronicle of the ancient Mexicans, and Fernando de Alva-Ixtlilxochitl (1568-1648), the original chronicler of the Texcoco royal line; whose work, though not rigorously correct in chronology, in volume and importance surpasses all his predecessors. It is to these two native writers that we owe the interpretation of the early Mexican hieroglyphs then in existence.

The chroniclers who treated merely of the Conquest did so from a European standpoint, and for this reason do not greatly concern us here. Still, mention must be made, at this point, of the *Crónica de la Nueva España*, written by Francisco Cervantes de Salazar, in Mexico City, from 1560 to 1567, utilized in manuscript by Herrera for his own *Historia general*, and published for the first time by M. Magallón, under the auspices of The Hispanic Society of America (Madrid, 1914). It is important both as history and as literature.

Among the Creole population of the sixteenth century, however, there were some poets of note. Prominent among these were Francisco de Terrazas, who was eulogized by Cervantes, but only a few of whose poems have been preserved (consult Gallardo, *Ensayo de una biblioteca española*, vol. i, columns 1003-1007, and García Icazbalceta, "Literatura mexicana: Francisco de Terrazas y otros poetas del siglo XVI," in the *Memorias de la Academia Mexicana*, vol. ii, pp. 357-425); Saavedra Guzmán, whose most famous poem, *El peregrino indiano* (Madrid, 1599), adds rather to his reputation as chronicler than as poet; González de Eslava, whose *Coloquios espirituales y sacramentales y canciones divinas* (Mexico, 1610) are a most interesting example of the primitive Mexican drama; and Bernardo de Valbuena, whose *Grandeza mexicana* appeared in Mexico, 1604.

Though the modest literary product of the seventeenth century may to some extent exemplify the intellectual decadence of New Spain during that period, yet it illustrates in one phase the aptitude of the *mestizo* caste for music and for poetry—an aptitude which displayed itself in both Castilian and Latin verse. Easily the leader of this period stands the poetess Juana Inés de la Cruz (1651-1695), a leading personage at the viceregal court, and later a nun, who dazzled her contemporaries by her learning, and whose subtle and suggestive verse gained for her the title "the tenth Muse." Another easy and correct versifier of the period was the Pueblan Matias Bocanegra, whose popularity lasted well into the succeeding century.

The making of verse at that time was simply a pastime, so a comparatively small output has survived until our own day. The man of letters par excellence of the century was the diligent and versatile Carlos de Sigüenza y Góngora (1645-1700), whose writings, poetical and prose, embraced a wide variety of literary and scientific subjects. He held the post of Cosmographer of New Spain, and for many years filled the chair of mathematics in the University of Mexico. The most noted colonial dramatist of the century was Eusebio Vela, who, if not equal to the leaders of the Spanish stage, surpassed many of those of the second rank. Juan Ruiz de Alarcón y Mendoza, the dramatist, was of Mexican birth and education; though his mature work was produced in Spain. The theological works of the time bore the names of many native Church fathers; likewise the best work on the early compiling of the laws of the Indies was that of Rodrigo Aguiar y Acuña (died 1629). In the realm of scientific literature the work of Enrico Martínez, *Reportorio de los tiempos y historia natural desta Nueva España* (1606), and that of Friar Agustín de Vetancourt, *Teatro mexicano* (1698), fittingly open and close the century.

The eighteenth century in New Spain was marked by a more extensive if less notable literary culture. This was especially true of the reign of Carlos IV, when public functions were the scenes of notable contests of poets and orators, many of whose productions were favorably mentioned in Europe. The book trade with Madrid and other Spanish cities was very flourishing and some especially fine editions of classical authors were printed in the Creole capital. Large and well-selected private libraries were common, both here and in the provincial towns. It was the period for the collection of archives and the writing of local history—a work in which the names of Veytia (1718-1779) and Morfi (died 1793) hold a prominent position. Spanish-American journalism is represented by the monthly gazette (1728-39) of Francisco Sahagún de Arevalo; by the *Gaceta de Literatura* (begun 1768) of José Antonio de Alzate (1729-90), whose periodical did much to stimulate intellectual effort and develop a correct literary sentiment; by the *Mercurio Volante* (begun 1772) of José Ignacio Bartolache, largely a medical journal; by the *Gaceta de México*, a fortnightly publication from 1784 to 1806, devoted to general news and literary and scientific discussions, and after that date a biweekly; and the *Diario de México* (1805) and the *Diario de Vera Cruz* (1805), the former devoted to literary and statistical matters and the latter a commercial sheet. Despite the strict censorship of all these periodicals they exercised a most beneficial effect upon public opinion at the close of the century.

In the literary production of the nineteenth century the work of the Mexican historians easily leads at home and occupies a prominent place in the world at large. An important work as collector of historical documents was done by José Fernando Ramírez. Among historians of lesser note may be mentioned Mora and Zamacois. Of unusual excellence is the work of Bustamante (died 1848), whose volumes treat of the revolutionary period and of the beginnings of the American war. The leader of his age, and still easily the foremost Mexican historian, was Lucas Alamán (died 1853), whose

work as statesman during a trying period has been eclipsed by his greater work as the historian of that period. His *Disertaciones sobre la historia de México* (3 vols., 1844-49) cover the viceregal period, and these are supplemented by his *Historia de México* (5 vols., 1849-52), continuing the narrative to the middle of the century. Among the more recent historians the greatest figure is that of Manuel Orozco y Berra (1816-81), who crowned a life of public service and valuable archaeological research by devoting his last 20 years to his *Historia antigua de México*. Closely allied with these is the work of Antonio García Cubas, whose *Diccionario geográfico, histórico, y biográfico de los Estados Unidos Mexicanos* (1889) is a model of its kind.

In the realm of pure literature the physician-poet Manuel Carpio (1791-1860) was well known for his vigorous descriptive verse, of which the most important example is *La cena de Baltasar*. His firmness and moderation in political life and the erudition and charm of his poems easily render him the most popular Mexican poet of the century. Ignacio Manuel Altamirano (born 1834), a noted liberal orator, is famous both as a poet and as a novelist. His poems are less vigorous in description than those of Carpio; the best known of his novels, *Clemencia*, is of considerable merit. To Rodríguez Galván is given the credit of the first national drama, but his work has been surpassed by Fernando Calderón (1819-45), whose *Reinaldo y Elena*, *Zadig*, and others gave promise of much better work had he lived to complete it. In comedy the name of Manuel E. Gorostiza (1789-1851) stands supreme. His comedies, of which the most famous are *Indulgencia para todos* and *Contigo pan y cebolla*, still hold popular favor. In addition to an active military and diplomatic career he organized the present *Biblioteca Nacional* and greatly advanced popular education throughout the Republic.

MEXICAN POPPY. See ARGEMONE.

MEXICAN SISAL. See HENEQUEN.

MEXICAN SUBREGION. In zoogeography, a subdivision of the Neotropical region which embraces Central America and the low, hot coast regions of Mexico to the mouth of the Rio Grande on the east and about to the border of the plains of Durango on the west. Between

these the northern fauna and flora are continued along the summit of the Cordillera as an entering wedge reaching south to Nicaragua. It has many species peculiar to itself, but no large groups. Many northern as well as southern forms extend their range into this middle region, as might be expected; and views differ as to where its boundaries should be drawn. (See SONORAN REGION.) On the whole, its affinities are South American. See DISTRIBUTION OF ANIMALS; NEOGÆA; NOTOGÆA.

MEXICAN WAR. The war between the United States and Mexico in 1846-48. It was the result of a series of outrages upon American citizens, giving rise to claims of the United States citizens on the government of Mexico, the recognition of the independence of Texas by the United States (1837), the annexation (1845) of Texas to the United States, in the face of bitter opposition on the part of Mexico, herself torn with revolution and contending factions, and finally of a dispute regarding the boundary of Texas, the United States claiming the Rio Grande as the boundary, while Mexico held that Texas did not extend farther south than the Nueces. Mexican hostility towards the United States had been further stimulated by a violation of the Territory of Mexico due to the indiscreet precipitation of Commodore Jones of the American navy, which occurred in October, 1842. Another cause of friction was the sympathy of the people of the United States for the Texans, which manifested itself in material assistance at critical moments. The war was essentially a popular movement both in Mexico and in the United States. The utterances of contemporaneous journals reveal the gross misconceptions entertained by the two peoples of each other, as well as the bitter feeling which existed in consequence of the causes enumerated above. So far as the Texas-Mexican question is concerned one cannot but feel the justifiableness of Mexican suspicion and resentment against the United States. The immediate occasion of the breach of diplomatic relations in 1845 was the annexation of Texas. During the fall of 1845 a large part of the small regular army of the United States was assembled under Gen. Zachary Taylor at Corpus Christi, near the mouth of the Nueces in Texas, and on March 12, 1846, under orders from the United States government, Taylor advanced into the territory the possession of which was then in dispute. After a march of 16 days he reached the Rio Grande at a point opposite to the Mexican city of Matamoros. A week earlier, on the twenty-first, the United States Minister to Mexico, Slidell, unable to negotiate a treaty in accordance with President Polk's directions, or even to secure official recognition, received his passports and started on his return to the United States. The Mexican army at this time numbered at least 30,000 of all arms and comprised, besides troops of the line, the active battalions of the states and the local national guards of the cities. The cavalry (lancers) were excellent horsemen, fairly disciplined, but indifferently mounted and poorly armed; the artillery, officered partly by foreigners, were good gunners, but the arm lacked mobility; the infantry were well drilled, but were armed with muskets of ancient pattern. An undue number of general officers (politicians rather than soldiers) and an inefficient general staff completed the Mexican resources for war. The

effective power of the Mexicans, however, was enhanced by the fact that they represented the defense, that they served among friends, and that they often fought behind strong fortifications. The American army was inferior in numerical strength to the enemy. At the close of 1845 the maximum strength was 7883. What it lacked in numbers, however, was made up in fighting quality. It consisted of two regiments of dragoons, four of artillery, and eight of infantry, with the usual staff corps. The dragoons were well disciplined, drilled as light cavalry, and armed with carbines and sabres; the artillery garrisoned the fortifications, but had little instruction in gunnery, excepting one company in each regiment organized as light artillery, which had reached a high standard of efficiency; the infantry, well disciplined and familiar with the use of arms, were distributed among a number of small frontier posts and never in large bodies; the officers, a majority graduates of West Point, were generally of superior ability, with the experience and self-reliance gained in Indian service and independent command. The navy of the United States, although small, was exceedingly efficient. The Mexican Republic had only a few small steamers and sailing vessels, and these principally on paper. Taylor's command hardly comprised 3000 effectives upon its arrival opposite Matamoros on March 28, 1846. Taylor immediately fortified his position and established a base of supply at Point Isabel. The mouth of the Rio Grande was blockaded by the small naval force accompanying the American army, and two vessels with supplies for the Mexican army were warned off and returned to sea. General Ampudia, who was in command at Matamoros from April 11 to April 24, protested vigorously against the occupation of disputed territory by General Taylor and insisted that, pending a settlement of the boundary dispute, the American army should be withdrawn to the Nueces. On April 24 General Arista superseded Ampudia and at once decided to take the offensive and cross the Rio Grande, notifying Taylor that he considered hostilities already to have begun on the part of the United States. On the twenty-fifth General Taylor learned that a large force of cavalry had crossed the Rio Grande some miles above his position, and sent a small squadron of the Second Dragoons under Captain Thornton to obtain definite information. While endeavoring to execute the order, Thornton, whose guide had deserted, found his command surrounded by a Mexican cavalry force of more than 500, and in an attempt to cut his way out lost one officer and eight men killed and two men wounded, and, with the remainder (46), was captured. Taylor notified his government that the first blow had been struck and called upon the governors of Louisiana and Texas for 5000 volunteers. On the thirtieth General Taylor, leaving a regiment of infantry and two companies of artillery to garrison an earthwork known as Fort Brown (see BROWNSVILLE, TEX.), in front of Matamoros, proceeded with the remainder of his command to Point Isabel in order to complete his communications. During his absence the Mexicans attacked the fort vigorously, but to no avail. As he was returning (May 8) he encountered Arista, who with 6000 men and 10 guns barred the road at a place 9 miles from Matamoros, known as Palo Alto. Taylor's force numbered 2300 officers and men

and 10 guns. After an indecisive fight of four hours (see PALO ALTO) Arista fell back to Resaca de la Palma, with a loss of over 600 in killed and wounded. General Arista's report put his loss at 252, dispersed, wounded, and missing. The American casualties comprised 7 killed and 47 wounded. On the following day Taylor continued his march. Arriving in front of the Mexican position, a low ridge commanding the road to Matamoros, the Americans paused to reconnoitre. On account of the dense chaparral, movements en masse were impracticable, and the infantry were deployed as skirmishers, with the artillery, supported by the dragoons, remaining on the road. Arista had been reinforced during the night by 2000 infantry. As on the day before, an artillery duel ensued, and the Mexican batteries held the Americans at bay for some time, until Taylor sent a squadron of dragoons under Captain May, who gallantly charged, taking the guns, together with the Mexican General La Vega, at the cost, however, of 1 officer and 7 men killed and 10 men wounded. Upon this the enemy gave way and fled from the field, pursued by the Americans, who made many captures, including 14 officers, 8 pieces of artillery, and several standards. The Mexicans, in confusion, retired to Matamoros, many being drowned in crossing the river. Taylor estimated the enemy's loss in this at about 400; that of the Americans as 36 killed and 70 wounded. On May 17 Arista evacuated Matamoros, and on the following day Taylor crossed the Rio Grande and took possession. Previously, on May 11, President Polk had sent to Congress his famous war message, in which he enumerated the wrongs committed by Mexico against the United States and, ignoring Mexico's reasonable claim to the country between the Nueces and the Rio Grande, asserted that "Mexico has passed the boundary of the United States, has invaded our territory, and shed American blood upon American soil. War exists and, notwithstanding all our efforts to avoid it, exists by the act of Mexico herself." Two days later Congress issued a formal declaration of war and threw the onus of striking the first blow upon Mexico. The ensuing three months were utilized by both sides in raising additional troops. Congress authorized a call for 50,000 volunteers, and the regular army was increased to 30,000. On August 19 Taylor marched with 6700 men (including volunteers) upon Monterey, which was held by Ampudia with some 9000 men, of whom 3000 were regulars, and 40 pieces of cannon. Previous to his arrival before Monterey, however, Santa Anna (q.v.) had subverted the government of Paredes and had established himself in power. Orders had been issued to Commodore Conner to place the Mexican coast under blockade, but not to obstruct the return of Santa Anna, who was believed to be in favor of peace with the United States. The American army arrived in front of the town September 19, attacked on the twenty-first, and after three days of severe fighting the defenses were taken by assault and the Mexican general capitulated, being permitted to march out "with the honors of war" and an armistice of eight weeks being agreed upon. (See MONTEREY, BATTLE OF.) The Mexican losses were estimated at nearly 1000; the American at 488. General Scott withdrew from Taylor the greater part of his army and instructed Taylor to establish his headquarters

at Monterey and refrain from further offensive operations. Through captured dispatches Santa Anna learned of Taylor's depleted force and quietly advanced upon the American position near Saltillo with 20,000 effectives. Taylor's scouts informed him of this in time for him to complete his dispositions for battle. With 4691 men, only 453 of whom were regulars, he awaited Santa Anna at Angostura, near Saltillo and on the road to San Luis Potosí. The engagement which followed, known as the battle of Buena Vista (q.v.), lasted two days (Feb. 22-23, 1847), and more than once the result seemed doubtful, the panic which seized certain regiments of Taylor's volunteers being counterbalanced by the steadiness of the regulars, the effective work of the light batteries, and the gallantry of the Mississippi regiment under Col. Jefferson Davis, afterward President of the Southern Confederacy. Notwithstanding the numerical superiority of the Mexican army, the obstinacy of the defense eventually won, and Santa Anna was forced to withdraw with 4000 killed and wounded. The American casualties comprised 264 killed and 450 wounded. These estimates are only approximate, as the number of killed and wounded in the battle of Buena Vista is uncertain. Soon afterward General Taylor returned home on leave of absence.

While the campaign in northern Mexico was thus progressing, the United States sent expeditions into New Mexico and California. Within three months the American flag had been hoisted at Santa Fe, the navy had planted the flag at San Francisco, and seaports on the west coast of Mexico were blockaded.

About a week before the engagement at Buena Vista, Scott had landed at the Lobos Islands, some 60 miles beyond Tampico and 7 miles from the mainland. He had at his disposal a force of 12,000 men, of whom two brigades were regulars. From Lobos the force proceeded to Anton Lizardo, where it lay inactive for a few days. A sandy beach lying 3 miles south of Vera Cruz was selected as a safe landing place on the mainland. By March 22 the investment of the city was complete, and a formal demand for surrender was made, which met with prompt refusal. For four days the besiegers bombarded the city and the castle of San Juan de Ulua, their fire being replied to with spirit; but on the twenty-fifth the foreign consuls used their influence in the interests of noncombatants and to secure the burial of the dead, and a suspension of hostilities ensued. On the twenty-ninth the city surrendered. (See VERA CRUZ.) After a brief interval the Americans pushed on towards their goal. At the same time Santa Anna, having reorganized his army, marched with more than 12,000 men from the city of Mexico. At Cerro Gordo (q.v.), a pass in the mountains, 60 miles from Vera Cruz, he awaited the invaders, about 8500 strong. On April 14 Scott arrived and on the eighteenth attacked. Although stoutly resisted, by noon the Americans had swept over Cerro Gordo and driven the Mexicans down the road for 10 miles. The spoils comprised 3000 prisoners, including 5 generals, and 40 bronze cannon. The casualties on the Mexican side were fully 1000; on the American side 431. The advance to Puebla was only slightly opposed, and on May 15 Worth's division of 4000 men encamped in the Grand Plaza of this "City of the Angels," in the midst of at least 60,000 hostile citizens, 75 miles from

the Mexican capital. On the seventeenth Scott made a final appeal to the Mexicans in the interest of peace, but in the embittered state of popular feeling it failed. On the contrary, Santa Anna strained every means for the defense of his capital; he appealed to the patriotism of the people, money was freely contributed, and almost every able-bodied man was enrolled for the common defense, until 36,000 men and 100 pieces of artillery were in readiness. Sickness and the discharge of seven regiments of volunteers had reduced Scott's army, but the arrival of 2400 men under General Pierce (afterward President of the United States) brought the total strength of the American forces to 10,738, nearly one-half of whom were recruits. Leaving a detachment of 500 men at Puebla, where 2300 wounded were in hospitals, Scott advanced upon the "Halls of the Montezumas." The city was entered by three roads, each guarded by rocky hills strongly fortified, the most prominent being that of El Peñon, mounting 51 guns, behind which were long and narrow causeways, flanked on one side by fields covered with broken lava and on the other by ponds and marshes. On the east and southeast large lakes added to the military protection of the city; an inner line of fortifications, made doubly impregnable by nature and art, completed the obstacles to a further advance on the part of the Americans. Undismayed by these, however, General Scott summoned his engineers, among whom were Captains George B. McClellan and Robert E. Lee, and a new road was cut, skirting Lake Chalco and by a circuitous route of 27 miles leading to the most vulnerable side of the town. After careful reconnoissance the first impediment, the hill of Contreras (q.v.), was taken (August 20) by an unexpected and desperate assault, with 813 prisoners (including 4 generals), 22 cannon, and thousands of small arms. The attacking force numbered 4500, the defense at least 7000 men, of whom 700 were killed, while the Americans lost about 60 in killed and wounded. Within easy supporting distance, moreover, was Santa Anna's reserve of 12,000 of the finest troops of Mexico. On the same day the strong positions of San Antonio and Churubusco (q.v.) were carried by the divisions of Worth and Twiggs, with further captures of 1800 prisoners, including 4 general officers, and 35 pieces of artillery; the Mexicans losing more than 3000 and the Americans about 1100 killed and wounded. After the "outer walls" had thus been gained, the American advance was again halted, and on August 23 an armistice was agreed upon pending the possibility that the demands of the United States might be acceded to without further bloodshed. This expectation proved futile, and on September 7 the final movement began. After severe hand-to-hand fighting, the defenses of Molino del Rey were carried by the Americans on September 8, and on the thirteenth the castle of Chapultepec was stormed. On the fourteenth the Mexican army evacuated the capital, and General Scott made his entry into the city. The total American losses during the operations in the valley of Mexico were 2703, including 383 officers; that of the Mexicans 7000 killed and wounded and 3730 prisoners of war. The spoils of war comprised 20 standards, 132 cannon, and 20,000 small arms. General Scott established his headquarters in the city of Mexico, was reinforced to an aggregate of 20,000 men, and

levied a tax of \$150,000 upon the municipal government, to be largely expended for the comfort of the sick and wounded. On Feb. 2, 1848, a treaty of peace between the United States and Mexico was signed at Guadalupe Hidalgo. (See GUADALUPE HIDALGO, TREATY OF.) The total number of American regulars who served in Mexico and its borders during the war was 21,509; of volunteers, 22,027.

E. Haferkorn, "War with Mexico: A Bibliography," in *Professional Memoirs* (Washington, 1914). U. S. Grant, *Personal Memoirs* (2 vols., New York, 1885-1886; rev. ed., 1895), is a valuable authority for the Mexican War. For the campaigns in northern Mexico, see Hughes, *Doniphan's Expedition: Containing an Account of the Conquest of New Mexico, etc.* (Washington, 1847; new ed., by W. E. Connelley, Kansas City, 1907). The most recent account of the Mexican War is R. M. McLeroy, *The Winning of the Far West* (New York, 1914). For further information concerning the causes and results of the war, see UNITED STATES.

MEXICO (Sp. *Méjico*, mā'hī-kō). The most southern country of North America, bounded on the north by the United States and the Gulf of Mexico, east by the United States, the Gulf of Mexico, and the Caribbean Sea, south by British Honduras, Guatemala, and the Pacific Ocean, and west by the Pacific Ocean. It extends through 18 degrees of latitude, between the parallels of 15° and 33° N., and through 30 degrees of longitude, between the meridians of 87° and 117° W., and has an area of 767,055 square miles, including the islands. Though usually considered a tropical country, it lies in the temperate and torrid zones, the tropic of Cancer crossing it nearly midway between its northern and southern boundaries. The boundary between Mexico and the United States is 1833 miles in length, the northern extremity of the country being its widest portion. The Isthmus of Tehuantepec, a little more than 100 miles across, is the narrowest part. The country has 1727 miles of coast line on the Gulf of Mexico and the Caribbean Sea and 4574 miles on the Pacific Ocean. In form Mexico is not unlike a cornucopia with its narrow end tapering towards the southeast; and the country is concave on its eastern and convex on its western coast lines. In the southeast is the low, wide peninsula of Yucatan, projecting northward; and in the northwest is the long narrow peninsula of Lower California, paralleling the mainland through 9 degrees of latitude and separated from it by the Gulf of California.

Topography. The surface of the main portion of Mexico rises steeply from the narrow coast lands and more gently from the great depression of the lower Rio Grande to the broad table-land of the interior. This central plateau is dominated by mountains whose great height is masked by the elevated lands above which they rise. The peninsula of Yucatan, on the other hand, has nothing in common with the main mass of Mexico in its conformation or geological structure, being a very low, level region.

The east coast is of monotonous aspect, low, flat, and sandy; but in the State of Vera Cruz, where the lofty mountain edge of the plateau most nearly approaches the coast, the inconspicuous shore line is forgotten by all who approach it from the gulf, for the majestic summits of the interior are visible far out to sea and dominate the view. Long reaches of sand banks stretch in front of the shore nearly as far south as Vera Cruz, shielding the shallow waters between the mainland and the banks from the sea waves. The Pacific shore is also generally low, though here and there relieved by spurs from the cordillera that extend to the ocean. Most of the many small islands near the coasts are uninhabited, though some of them are very fertile. The most important islands are El Carmen, the largest Mexican island in the Gulf of Mexico; San Juan de Ulua and Sacrificios, at Vera Cruz; Mujeres and Cozumel, in the Caribbean Sea; Guadalupe and Cedros, in the Pacific off the coast of Lower California; the Tres Marias group, near the entrance to the Gulf of California; and the Revilla Gigedo group, far off the coast of the State of Colima, to which it is assigned.

There are no good natural harbors on the Gulf of Mexico coast, but this impediment to commerce has been partly relieved by the expenditure of large sums. Jetties at the entrance to the port of Tampico have increased the depth from 9 to 24 feet; similar improvements have given Puerto Mexico a depth of 30 feet at the entrance to the Coatzacoalcos River; and breakwaters at Vera Cruz have turned that dangerous roadstead into a safe and commodious harbor. The best natural harbors are on the Pacific coast, those of Acapulco, Manzanillo, Guaymas, and La Paz, the chief town of Lower California, being most conspicuous. That of Acapulco is one of the finest natural harbors in the world. These excellent Pacific coast ports have, however, the disadvantage that they are shut off by mountains from the busiest parts of the Republic, and therefore do not have a large share of the country's trade.

The east and west edges of the great central table-land are bordered by two cordilleras or high mountain ranges. The Sierra Madre Oriental, on the east, runs nearly parallel to the Gulf of Mexico, at distances of 10 to 100 miles from the coast, the land gently sloping from the foot of the mountains to the sea. The Sierra Madre Occidental, on the Pacific side, is on the whole nearer the coast. In the south the main western cordillera trends towards the east, and in the states of Michoacan and Guerrero there is a coastal range, with a broad fertile valley stretching between it and the main chain. The most continuous range is the Sierra Madre Occidental, which extends from Arizona to Oaxaca with a mean elevation of over 10,000 feet. The inland faces of the two border ranges descend somewhat gently to the central table-land, while their seaward sides are more precipitous, presenting many

scarps and cliffs and furrowed with deep chasms or gorges. The border ranges gradually approach one another towards the south, and the narrowing plain between them terminates, south of the city of Mexico, in a labyrinth of mountains culminating in giant peaks, such as Popocatepetl and Orizaba. They include an irregular line of mountains, known to the Mexicans as the Cordillera de Anahuac, extending east and west across the country without forming a continuous chain, but embracing most of the active volcanoes.

The numerous mountain peaks, mostly volcanic in origin, between the twenty-second parallel and the Isthmus of Tehuantepec, are the most elevated features of the topography. The volcanoes are of recent formation and most of them are either extinct or quiescent, the exhalations of the latter consisting only of aqueous and sulphurous vapors. The loftiest of these mountains is the volcano Orizaba (Citlalpetl, Star Mountain, 18,250 feet in height), situated to the north of the line of the railroad between Vera Cruz and the city of Mexico. It has not been in violent eruption since the middle of the sixteenth century, and has been nearly quiescent since the middle of the nineteenth century, though vapors and sulphurous jets are still ejected from its crater, which, however, is usually filled with snow. Popocatepetl (Smoking Mountain, 17,520 feet), the most widely known of the Mexican volcanoes, is comparatively easy of ascent. Its yawning crater is over half a mile in circumference and 250 feet deep, and through the melted snow around the orifice frequent jets of gas emerge. Orizaba and Popocatepetl are among the most perfectly formed of volcanic mountains. Ixtaccihuatl (White Woman, 16,960 feet), which rises to the north of Popocatepetl, is not of volcanic origin, though there are many legends regarding its ancient activity. The extinct Nevada de Toluca (14,950 feet) rises to the south of the town whose name it bears, a lake from melting snows partly filling its crater with pure cold water in which fish of a peculiar species are found. Malinche (13,460 feet) rises in isolated majesty from the middle of the Tlaxcala plateau. On the verge of the central plateau bordering the Sierra Madre Oriental is Cofre de Perote (13,400 feet), another great eruptive summit now extinct, which owes its name "coffer" to the quadrilateral form of its summit, and is famous for the Chinacamote cavern on its western side, said to be over 30 miles in length, but difficult of access because its floor is strewn with large rocks. Colima (12,970 feet), not far from the Pacific and the most active volcano in Mexico, is in an almost incessant state of ebullition. The view from its summit, during its periods of quietude, is unrivaled, embracing the ocean, widespread plains, and the glittering snow crown of Popocatepetl far to the east. The forested Tancitaro, nonvolcanic (12,650 feet), is in the same latitude as Colima, but nearer to the Sierra Madre. As the limit of perpetual snow is a little under 15,000 feet above the sea, only three of these lofty summits, Orizaba, Popocatepetl, and Ixtaccihuatl, have an enduring crown of snow; and considerable glaciers develop only on Ixtaccihuatl. The small volcano of Jorullo (4330 feet) is said by the natives to have suddenly risen above the cultivated plain in a single night near the end of 1759, though its period of construction did not end till 1763. Humboldt made

it famous by the description he received from the natives of its terrific energy. Columns of superheated air still rise from its crater.

The wide table-land or plateau of Anahuac (q.v.), lying between the two cordilleras, slopes from south to north, being from 5000 to 9000 feet high in the states of Mexico and Puebla and falling to 3600 feet at El Paso, on the United States border. Its surface is covered with long-continued outpourings from the volcanoes and the detritus worn away from the mountain slopes, which, according to Heilprin, filled the original depressions, the valleys of to-day having been imposed upon this new surface. The mountains of the plateau, nearly buried by the accumulations of past ages, still rear their heads above the general level, and here and there are continuous ridges or ranges which divide the surface into well-defined basins such as the valley of Mexico, nearly 8000 feet above the sea and completely inclosed by mountains. The rivers of the plateau have cut deep valleys and cañons, some of which are 1000 feet below the general level, extending the warmer influence of the coast lands into the plain. These barrancas, as they are called, are watered by small streams and contrast, by the luxuriance of their vegetation, with the dry and often barren plateau above them. The most famous of the barrancas extend from the neighborhood of Guadalajara through the western mountains to Colima and Tepic. On the whole, the surface of the plateau is so level that there was little difficulty, even before there were wagon roads, in traveling by carriage between the city of Mexico and Santa Fe.

The dry and sandy peninsula of Lower California is traversed by the Sierra de la Giganta, broken in two places and culminating in Mount Calamahue (10,126 feet), in the northern part of the peninsula. Owing to its excessively dry climate and scanty population, this peninsula is still little known. The huge quadrilateral peninsula of Yucatan is projected beyond the continental coast line towards Cuba, has no mountain ranges, and its mean altitude is scarcely above 100 feet.

Hydrography. The form of the central plateau, hemmed in by border ranges parallel with the sea and preventing wet winds from reaching the interior, is not favorable to the development of large fluvial systems. No Mexican river is important for its volume or is valuable for commerce excepting to a very limited extent. All rivers tributary both to the Gulf of Mexico and the Pacific are obstructed by sand bars at their mouth. The longest river is the Rio Grande, which rises in Colorado and for 750 miles forms the boundary line between the United States and Mexico. The waters of its upper course are so far diverted for irrigation purposes that the lower river is almost entirely dry during the dry season. While the Mexican part of its basin comprises 94,000 square miles, the river receives scarcely any perennial stream. Its largest affluent in Mexico is the Rio Conchos, which is fed for 200 miles north and south by the east slope of the Sierra Madre Occidental. The Salado tributary comes from the Sierra Madre Oriental, and its name, Salt River, indicates that its waters are rendered saline by their very slow passage through shallow basins. Other tributaries have the same peculiarity, so that they give a brackish taste to the waters of the Rio Grande itself. The Pánuco, the most con-

siderable river of the south tributary to the Gulf of Mexico, rises north of the Mexican valley and empties at the port of Tampico. The Coatzacoalcas, or Snake River, drains the alluvial plain and low mountain district, forming the north slope of the Isthmus of Tehuantepec; small boats ascend it for over 60 miles from its mouth. The most important rivers on the Pacific coast are the Mexcala, or Rio de las Balsas (river of the rafts), which, as its name indicates, is navigable to a limited extent in its lower reaches, and the Lerma or Santiago, which rises a little west of the city of Mexico, and about 15 miles from Guadalajara is precipitated over the great falls of Juanacatlan, one of the finest waterfalls in the Western world.

The Lake of Chapala, which receives and discharges the Lerma River, is the largest lake in Mexico; many fine country houses have been built on its shores. Mexico has no really large lakes, though some of the sheets of water, as Cuitzeo and Pátzcuaro, in the State of Michoacan, are famous for their beauty. A considerable part of the valley of Mexico is occupied by six very shallow lacustrine basins, four of the lakes salt. They are the relics of much larger lakes which existed when the Spaniards invaded the country.

Climate. As a whole, Mexico is a hot country, but its climate, if not one of the most salubrious, is among the most delightful in the world; the normal warm temperature is modified by great contrasts in elevations and by the position and trend of the mountain ranges, which influence the force and direction of the winds and the distribution and amount of the rainfall. The climatic differences depending upon the differing altitudes are so great that the vegetable products include almost all that grow between the equator and the Arctic regions. In some large areas, however, uniformity of climate prevails; thus, the great plains of the northern states, hemmed in by mountains from sea influences, have the extremes of temperature characteristic of the continental climate in the United States. On the other hand, the Isthmus of Tehuantepec is entirely included in the wet tropical zone.

Three zones of climate are distinctly marked. The tierra caliente, or hot land, lies along the low maritime zone of the Gulf and the Pacific and includes swampy and sandy coast lands and well-watered plains and slopes leading up to the mountains. The growth of luxuriant tropical vegetation is promoted by a mean annual temperature of 77° F. to 82° F., the mercury seldom falling below 60° F., but often rising to 100° F., and in the sultry districts of Vera Cruz and Acapulco to 104° F. Some places, as the port of La Paz, are among the hottest in the world. The seacoasts are unhealthy, fevers prevail, and in some localities yellow fever and black vomit are endemic. The health conditions may be greatly improved by draining the swamps, as has already been shown at Vera Cruz.

Above the Gulf and Pacific hot zones are the tierras templadas, or temperate lands, from 3000 to 6000 feet above the sea, embracing the higher terraces and parts of the central plateau. The temperate lands rise to a higher elevation in the southern than in the northern states. The mean temperature is from 62° F. to 70° F. and does not vary more than four to five degrees during the year. Thus, extremes of heat and cold are unknown; semitropical products, like those

of southwest Europe, are abundant and to some extent, also, products both of the tropical and cold regions. Around the city of Oaxaca wheat and sugar cane may be seen growing on the same piece of ground.

Above the temperate lands are the tierras frias, or cold lands, 7000 feet or more above sea level, with a mean temperature of from 59° F. to 63° F. Most of the central plateau, with its girdle of mountains, is included in this region, but in great depressions of the surface a warmer temperature and tropical products are found. The less elevated parts of this region produce cereals and apples, while the higher grounds, some of which extend above the snow line, have a sparse vegetation. The lower cold lands are the most thickly inhabited regions in Mexico.

Owing to the differences of temperature and the effect of the mountain ranges upon the direction of the winds, the rainfall is very unequally distributed. During the rainy season, from the middle of May to October, many torrential storms occur in the southern half of the Republic. Little or no rain falls in the winter or dry season. The cold lands receive only about one-fifth as much rain as the temperate lands, except in some of the mountain districts, where the precipitation is heavy. The city of Mexico has a mean rainfall of 30 inches a year, which is somewhat in excess of the general supply of the plateau to the north of it, though the precipitation on the mountain coast lands is two to four times as great. The extreme northern part of the plateau is semiarid, reproducing the conditions that prevail in Arizona and New Mexico. The country lies in the zone of trade winds blowing from northeast to southwest, but, as mentioned above, the trend of the ranges modifies their normal direction. Both the Gulf and Pacific coasts are exposed to violent gales, which often do great damage to shipping.

Geology and Mineral Resources. The mountain ranges are formed chiefly of plutonic and volcanic rocks, such as granites, gneiss, syenites, mineral-bearing trachytes, basalts, porphyries, obsidian, sulphur, pumice, lavas, and tufa. Sedimentary formations are also represented, especially by a carboniferous limestone interspersed with deposits of anthracite. The land consists mainly of metamorphic formations largely penetrated and overlaid by volcanic outpourings and the debris resulting from mountain denudation. The most valuable rocks thus far known are the argentiferous porphyries and schists of Sinaloa and the central plateau. It has not yet been revealed whether the auriferous deposits of Sonora are destined to equal them in economic value. The sandstones of the northern states have produced the sandy plains of north Mexico, but none of the horizontal layers is rich in ores, which are found chiefly in metamorphic rocks of Durango, Chihuahua, and the south.

Mexico is one of the richest mining countries in the world. It produces annually about 6 per cent of the world's output of gold, 30 per cent of silver, 5 per cent of copper, and 12 per cent of lead. Excepting Sinaloa and Sonora, which contain vast stores of the precious metals, nearly all the historic mines lie on the south-central plateau at elevations of from 5500 to 9500 feet. Silver is found in all the states, but the principal mines are in Sonora, Chihuahua, Sinaloa, Zacatecas, San Luis Potosí, Guanajuato, Hidalgo, and Mexico. A line drawn from Guadalupe y Calvo, Chihuahua, through Guanajuato

and Mexico City, to Oaxaca will intersect perhaps the richest silver-yielding zone of the world. The central group of mines in the districts of Guanajuato, Zacatecas, and Catorce in the states of Guanajuato, Zacatecas, and San Luis Potosí have thus far yielded over half of the silver mined in Mexico. The Veta Madre lode of Guanajuato alone produced \$252,000,000 between 1556 and 1803. Eighteen states of Mexico have gold-bearing districts; the metal, however, is found chiefly on the slopes facing the Pacific. Owing to the greater difficulty and expense in mining and reducing gold, it was formerly only produced when found in connection with silver ores. More recently gold-bearing quartz lodes have been worked. The rise of the gold production has been rapid during the last 20 years. In 1893 its value was less than 4 per cent of the silver output, in 1902 it was 20 per cent, and, in 1912-13, 48 per cent. Copper in a pure state is found near the city of Guanajuato and associated with gold in several states. Iron is in vast abundance in Michoacan, Jalisco, and Durango, but until the coal fields found at various points are developed there is little prospect that iron mining will become very important. The famous Cerro de Mercado, just outside the city of Durango, which was discovered in 1562, is a hill about 400 feet high, 1½ miles long, and ½ to ½ mile wide, consisting of a solid mass of iron ore 65 to 75 per cent pure iron. Mining experts have estimated the amount of ore above the surface at 500,000,000 tons, while no one knows how much may exist below the plain. Fuel is one of the most pressing needs of Mexico. Firewood costs in the city of Mexico \$14 a cord. Coal ranges from \$16 to \$22 a ton and is brought from England and the United States. The difficulty is that most of the coal is remote from lines of transportation, and the fields cannot be developed till means of cheap carriage are provided. Sonora has a carboniferous area with veins from 5 to 16 feet in thickness of hard clean anthracite carrying as high a percentage of fixed carbon as the best coal of Wales. When it can be transported the anthracite of this field will supply the Pacific coast of North America with anthracite of the first quality for years to come. The coal deposits of Michoacan and Oaxaca are also undeveloped. Many of the inhabitants of the northern state of Coahuila burn mesquite bush, straw, and cotton bushes because they cannot procure the coal mined at Salinas in their state, which now supplies fuel for the International Railroad Company, a part of the Southern Pacific Railroad, and the factories in Monterey. Much lead is associated with silver, and tin, sulphur, salt, marble, and the building stones are in abundance. All other mining enterprises, however, are dwarfed by the colossal development of silver production. Most of the mines yield silver either alone or in combination with other ores. The mining industry, as well as all others, was seriously affected during the revolutionary movements from 1910 onward. In 1912-13 the silver production amounted, in Mexican silver, to \$81,481,102 (in 1911-12, \$88,839,747; in 1877-78, \$24,837,000), and the gold production, \$39,591,686 (in 1911-12, \$49,905,115; in 1877-78, \$747,000). In 1913 the production of copper was 116,402,880 pounds. The production of the other principal metals, in 1907, was as follows, in metric tons: Lead, 70,241,558; antimony, 3,070,230; iron, 1,363,-

290; coal, 1,024,579; mercury, 25,887. In 1907 the total number of mines of all kinds was 7296, of which 1032 were in operation, employing 95,991 men, 524 women, and 3130 children. In 1914 it was estimated that the foreign and Mexican capital invested in the mining industry amounted to \$647,000,000.

One mint and ten government assay offices are maintained. The total coinage of Mexican silver from 1537 (when the city of Mexico mint was founded) to 1905 amounted to \$3,546,393,617—more than one-third of the world's production of silver since 1493. As a large amount of silver is not coined, but is used in the arts, it is estimated that Mexico has produced nearly one-half of the world's silver mined in the past four centuries. From April 16, 1905, the mints and assay offices have ceased to accept bullion from private persons for free coinage. Most of the gold and silver is exported, the bulk going to the United States.

Petroleum. The presence of deposits of oil and asphalt was always recognized, but it is only within the past few years that this industry has been developed. Oil is found throughout the Gulf coastal plain, from Tamaulipas to Campeche; the principal centres of production are the Tampico region and the Isthmus of Tehuantepec. Most of the oils are heavy and are more especially adapted for use as fuel, although many contain valuable refining products. Many companies have been formed for exploiting the oil fields, refineries and pipe lines have been established, and in the Tampico district alone about 5,000,000 acres are held for oil purposes. The chief oil ports are Tampico, Tuxpam, and Puerto Mexico. The following table from the *Mexican Year Book* of 1914 shows the remarkable growth of the petroleum production in Mexico:

YEAR	Barrels	Percentage of world's production
1900-06.....	1,000,000	...
1907.....	1,000,000	0.38
1908.....	3,481,410	1.22
1909.....	2,488,742	0.84
1910.....	4,531,826	1.38
1911.....	14,051,693	3.70
1912.....	16,558,215	4.71
1913 (estimated)....	26,000,000	...

Flora and Agricultural Resources. The sharp differences in climate produce rapid transitions in forms of vegetation; in a few hours' travel great differences not only in the kinds of plants but also in the stages of growth of the same plant are observed. The Mexican Southern Railroad from Puebla to Oaxaca descends by fertile terraces from 7000 feet to 1750 feet above the sea. In March the green wheat is just peering above the ground in Puebla, while lower down along this railroad fields of wheat are ripe for harvest and still lower the grain is being threshed. The varied conditions of temperature and moisture result in the greatest contrasts, desert areas lying contiguous to grassy steppes, which are succeeded by cultivated fields, and in the lowlands by forests with an inextricable tangle of tropical undergrowths. Gray, thorny plants characterize the northern region, where rain seldom falls, though even this region is brightened in the spring by many flowers. Owing to the undeveloped state of coal mining and the great need of fuel and timber for the mines,

the forests that once covered the mountains have been largely destroyed, and thus the conditions of rainfall have been considerably modified. But many varieties of oak and also pines and firs are found on the mountain slopes; and the hot lands have about 100 varieties of building and cabinet woods, including mahogany and rosewood, besides dyewoods, gum trees, the fig, and oil-bearing trees and plants, such as the olive, coco palm, sesame, and almond. Fifty-nine species of medicinal plants have been classified.

Few countries equal Mexico in the variety of its economic vegetable products. Coffee is extensively cultivated in the temperate lands of Vera Cruz, Oaxaca, Chiapas, Morelos, Jalisco, and Tepic. It is of an excellent quality and about 40,000,000 pounds are exported annually. About 90 per cent of the cotton is grown upon the irrigated lands in the "laguna district" of the states of Coahuila and Durango, and the remainder is produced in the districts of Tuxpam and Vera Cruz and along the Pacific coast. The entire production of the staple yields about one-half the amount needed for the Mexican mills. Sugar cane is extensively cultivated in the lowlands of the southern states, but as yet the amount produced is insufficient to supply the home market. Tobacco is grown all over the Republic and that produced on the warm lands south of Tampico and San Blas is almost equal to Cuban leaf in aroma. Its improved cultivation was introduced by Cuban planters about 40 years ago. Maize, the chief crop throughout the temperate region, thrives best south of Durango. Another great food staple is the frijol, or brown bean, cultivated with peas and lentils and daily eaten by most Mexicans. The wheat crop in the cold zone is worth only about one-fourth as much as the maize crop.

A great variety of tropical fruits are raised in the hot zones, including oranges (up to 2500 feet), lemons, bananas (up to 5000 feet), easy to cultivate and affording a large profit, pineapples (from sea level to 3000 feet), and coconuts along the hot coasts. Many species of the agave grow on the central plateau. One of them, the maguey, yields large quantities of a white juice which, when fermented, produces the intoxicating liquor called pulque, the national beverage of Mexico. Other species of the agave yield henequen, or sisal hemp, whose cultivation and preparation for market are by far the most important of the fibre industries and have made the prosperity of the State of Yucatan, in the northern part of which it is produced. Enormous quantities are exported to the United States for sacking, cordage, and binder twine. The *Castilleja elastica* is the predominant species of rubber tree, and, though rubber collecting is as yet little developed, it is destined to be very profitable. The cacao tree thrives chiefly in Chiapas and Tabasco, but not enough cocoa is produced for home consumption. The vanilla bean grows luxuriantly on the Gulf coast and brings a high price on account of its excellent quality. Rice on the coasts is usually grown without irrigation, depending entirely upon the rainfall. The soils of Mexico excepting in the sandy north and some areas of sand along the coasts are excellent. The agricultural resources are capable of far larger development as soon as irrigation is applied to the naturally productive lands. Much of the plateau is semiarid, but the neighboring mountains have inexhaustible supplies of water, which by the construction

of reservoirs and other modern appliances may be conserved for agricultural uses. Farming methods are crude and modern machinery has been introduced only on the large plantations. The chief agricultural products of 1907 were (a kilogram = 2.2 pounds; a hectoliter = 2.8375 bushels):

	Kilograms		Kilograms
Sugar cane.....	2,762,089,370	Chile seco..	13,312,964
Wheat.....	312,109,551	Cacao.....	3,108,960
Henequen.....	113,089,629	Oats.....	406,925
Ixtle.....	62,767,916		
Coffee.....	50,113,450		Hectoliters
Cotton.....	33,631,842	Corn.....	72,501,217
Rice.....	32,885,335	Barley.....	3,819,876
Sweet potatoes..	27,277,367	Frijoles.....	2,113,472
Tobacco.....	19,445,564		

Fauna. In the plateau regions the fauna is that of the North American continent, while it is more closely associated with that of the West Indies in the coast lands of the gulf; that of the Pacific seaboard partakes of the character of the California and South American fauna. Wolves and coyotes are common in the northern states, and bears, peccary, the puma, jaguar, and ocelot are found among the mountain forests. In the tropical forests are five varieties of monkeys and a species of sloth. Among the other animals are the hare, rabbit, squirrel, beaver, mole, marten, otter, and several species of deer. A few boas in the south and several other species of snakes, some of them very venomous, as the rattle and coral snakes, represent the ophidians. Noxious insects infest the hot regions in myriads. The coast waters and estuaries of the rivers teem with fish, and turtle shell is an article of some trade importance. Bees are numerous and their wax is exported. Vultures are the scavengers of every town, and parrots, humming birds, and other tropical birds vie in brilliancy of plumage with those of Brazil. The Mexican mocking bird and other songsters are unsurpassed. Only the turkey and a species of duck have been domesticated, all the farm animals having been introduced by the Spaniards into Mexico, where they have multiplied prodigiously.

Animal Industries. Stock raising is one of the leading industries. In the low-lying coast regions, particularly in Vera Cruz and Tabasco, are moist savannas, covered with nutritious grasses, where cattle may be reared and fattened at small expense; and on the comparatively arid plateau of the north there is sufficient herbage to support enormous numbers of cattle. On some of the haciendas 10,000 to 30,000 head are in charge of vaqueros, who are very skillful in throwing the lasso and in all the other arts of the cowboy. Mexican cattle are of inferior quality (long-horned type) and small size, weighing only 900 to 1000 pounds. Stock raisers have begun to improve their herds by the importation of better breeds from the United States. Hides are an important export to the United States, and hundreds of thousands of undeveloped steers are sold in Texas. The horses are small but hardy animals. Sheep produce only 1 to 2½ pounds of coarse and inferior wool to the fleece, all of which is consumed in the home mills, which import much wool of finer grades, while well-to-do Mexicans wear imported clothes. The tendency towards the improvement of all the native domestic animals and of the methods of

stock raising has given rise to a large expansion in these industries.

Manufactures. The manufacturing industries have progressed slowly, though with the advent of much foreign capital during the long period of peace under the Díaz régime there was a large development of many industries. The first cotton mill was erected in 1834. In 1911-12 there were 148 cotton spinning and weaving mills (126 in operation) with 762,149 spindles, 27,019 looms, and 50 printing machines, consuming 33,153,636 kilograms of cotton, producing 14,128,366 pieces of cloth (27 meters long) and 3,020,569 kilograms of yarn, and employing 32,209 hands. There were 44 factories in Puebla, 14 in Vera Cruz, 12 in the federal district, 10 in Coahuila, and from 1 to 8 in 18 other states. The 440 tobacco factories used 10,137,789 kilograms of tobacco and produced 570,352,851 packages of cigarettes, 42,461,139 cigars, 36,818,213 cheroots, besides pipe tobacco and snuff. The largest number of factories were in Guanajuato (62), Vera Cruz (55), Michoacan (45), Tamaulipas (34), Jalisco (28), and San Luis Potosí (25). In 1907 over 2000 establishments engaged in the manufacture of sugar products produced 116,774,165 kilograms of sugar, 96,238,319 kilograms of molasses, and 84,241,728 kilograms of panocha. The distilleries manufactured 1,769,397 hectoliters (1 hectoliter = 26.417 gallons) of rum and 4,629,818 hectoliters of pulque. The other important industries are woolen and linen spinning and weaving, the manufacture of glass, drugs, chocolate, paper, guayule, matches, soap, brick and tile, porcelain, flour, iron and steel, candles, furniture, and beer brewing. The artisans of the plateau are skilled in making the broad-brimmed Mexican hats, silver ornaments, jewelry, saddlery, leather work, and embroidery, and in other arts that contribute to the distinctive finery of Mexican attire and equipment. The feather work and other products of the Indians are still highly prized. The government encourages the development of home industries by imposing a tariff amounting on an average to about 38 per cent on the declared value of nearly all imported goods.

Commerce. The value of the foreign trade of Mexico has for years been rapidly increasing. The exports have steadily increased and have been larger than the imports, which have fluctuated considerably since 1907. The following table shows the value, in Mexican silver dollars or pesos (the peso = \$0.46 United States currency), for the several fiscal years:

YEAR	Imports	Exports
1894-95.....	\$66,200,000	\$95,000,000
1899-1900.....	128,700,000	158,200,000
1904-05.....	178,204,962	208,520,451
1909-10.....	194,866,000	260,046,000
1912-13.....	195,772,000	300,405,000

The trade with the leading countries and the percentages of the total trade were as shown on page 540 for the several fiscal years.

The leading articles of export in 1912-13 were valued (in pesos) as follows: Silver, 91,293,652; gold, 39,591,427; copper, 36,522,115; henequen, 30,133,754; dry hides, 11,170,432; coffee, 11,263,700; rubber, 8,376,350; cattle, 7,555,585; guayule, 7,234,576; chick peas, 4,930,361; lead, 4,907,334; textiles, 3,646,441; woods, 3,365,131; and vanilla, 3,315,471.

The principal classifications of imports and exports were valued as in the tables below.

Shipping and Communications. Most of the foreign trade of Mexico is carried either by railroad or in foreign bottoms. The mercantile marine of the country comprised, in 1911, 32 steamers of 16,648 net tons and 52 sailing vessels of 8712 net tons. In 1911-12 over 9000 vessels engaged in foreign and coastal trade en-

a corporation in which the government owns a controlling interest by holding 50.3 per cent of the shares. The National Railways System, formed in 1909 by the consolidation of various lines, extends from the United States border, at two points, to Guatemala and from the gulf to the Pacific in two places. Of this system, the National Railroad (1218 miles) begins at Laredo and traverses the eastern portion of the central

tered the Mexican ports. The table on page 541 shows the increase in the number of vessels and tonnage.

In 1911-12, 1107 steam and 6 sailing vessels visited more than one port, bringing the total tonnage of vessels entering up to 7,256,210 and of those departing to 6,611,921. In this same year 4169 steam and 2982 sailing vessels, most of them very small and owned by Mexicans, which were engaged in coastwise trade, entered the various ports of the Republic.

The first railroad, only 3 miles in length, connecting the city of Mexico with Guadalupe, was completed in 1854. Since 1870 railroad construction has been carried on rapidly. The railroad between Vera Cruz and the city of Mexico was completed in 1873. Mexico is now covered with a network of railways, which reach all the important cities and mining districts. In 1910 the railway mileage was 15,260 (1914, about 16,000), of which 8612 miles were under the control of the National Railways of Mexico,

plateau to Mexico City, with a branch to Matamoros; the Mexican Central (3516 miles), starting from Ciudad Juárez, runs across the central uplands to the capital and beyond to the Balsas River, with numerous branches, one to Tampico on the gulf and one to Manzanillo on the Pacific; and the International Railway (917 miles) from Piedras Negras (Ciudad Porfirio Díaz) crosses the states of Coahuila and Durango. South and east of the capital the National Railway controls the Interoceanic Railway (736 miles), Mexico City to Vera Cruz; the Vera Cruz and Isthmus line (264 miles), from Vera Cruz to the Tehuantepec line; the Tehuantepec Railroad (220 miles), from Puerto México (Coatzacoalos) on the gulf to Salina Cruz on the Pacific; and the Pan-American Railway (297 miles), from San Gerónimo on the Tehuantepec line to the Guatemalan border. The principal independent lines are the Mexican Railway (520 miles), from Mexico City to Vera Cruz; the Kansas City, Mexico, and Orient (276

miles), building across central Chihuahua; the Mexico Northwestern (472 miles), from Ciudad Juárez through western Chihuahua; the Southern Pacific (1195) from Nogales southward along the Gulf of California and the Pacific to Mazatlan and Tepic; and the United Railways of Yucatan (503 miles). Most of the railroads of Mexico have been constructed with foreign capital, together with liberal government subsidies, under concessions providing for the ultimate reversion to the government, and are

the banks chartered under the Law of 1897. Banks multiplied so rapidly after this date that in 1905 it was decided, in order to check further extension, that no further charter for a bank of issue should be granted until after Dec. 31, 1909. Subsequently this time limit was extended to March 19, 1922, the date of the expiration of the first charters granted under the law, which is tantamount to the concession of a monopoly to the now existing banks. All banks are under the direct supervision of the govern-

operated according to the Mexican Railway laws, under the supervision of the Railway Commission.

In 1912 the federal government, which has a monopoly of the commercial telegraph business, had in operation 530 telegraph offices, 25 telephone stations, and 8 wireless telegraph (Telefunken system) stations. It had 46,037 miles of telegraph wires and transmitted 4,531,683 messages, which produced a revenue of 2,357,000 pesos. The railways also have telegraph lines for handling their own business. In 1912 there were 2911 post offices (1972 in 1900), which handled 101,920,217 letters, post cards, and packets. The postal revenue was 4,700,297 pesos in 1912-13. Mexico is a member of the Universal Postal Union, has both national and international money-order systems, and has parcel-post conventions with a number of countries.

Banking. The present banking system of Mexico dates from 1897. The law of that year provided for three classes of banks, viz.: banks of issue, issuing notes payable to bearer on demand; banks for mortgage loans, issuing mortgage bonds to cover loans on real estate; and banks of encouragement, issuing treasury bonds to cover loans to industry and agriculture. By the new law the National Bank of Mexico, which with the Bank of London and Mexico and the International and Mortgage Bank had been established previous to the passage of the law and enjoyed a monopoly of the issuance of bank notes, was restricted and the establishment of other banks of issue was permitted in the states under conditions practically limiting the number to one in each state. The purpose of the law was to extend banking privileges to all parts of the Republic, but the granting of charters was surrounded by careful restrictions. A bank of issue could not be founded with less than 500,000 pesos capital (increased to 1,000,000 pesos in 1908); no bank could be organized till the capital was fully subscribed and 50 per cent paid in; bonds equal to 20 per cent of the capital were to be deposited with the government or the National Bank; and the duration of the charter was not to exceed 30 years. Numerous special privileges, mostly in the form of exemptions from taxation, were conferred upon

ment and are obliged to publish detailed monthly statements of their condition.

In 1897 there were altogether 10 banks, with a capital of 41,500,000 pesos, cash holdings of 43,915,000, and reserve funds of 2,983,000. At the close of the fiscal year 1912-13 there were 33 chartered banks, with a capital (stated in pesos) of 164,600,000, cash holdings of 86,517,284, reserve funds of 37,140,595, and note circulation of 130,228,259. The capital of the National Bank is 32,000,000; of the Mexican Central Bank, 30,000,000; of the Bank of London and Mexico, 21,500,000; of the International and Mortgage Bank, 5,000,000; and of the other banks from 10,000,000 to 200,000. After the above date banking conditions were seriously disturbed by the revolution. The banking system in 1915 comprised 25 banks of issue, including the National Bank (founded in 1882), the fiscal agent of the government, with its 60 branches, the Bank of London and Mexico (established in 1864), and 23 state banks, two mortgage banks, and six banks of encouragement, one of which, the Mexican Central, organized in 1898 at Mexico City, serves as a clearing house. There are also a number of independent banks in the capital. Banking in Mexico is very profitable and the existing banks are in a flourishing condition. During the decade ending 1912 the National Bank paid annual dividends ranging from 15 to 20 per cent and the Bank of London and Mexico from 12 to 14 per cent. In 1912 the reports of 27 banks paying dividends showed an average of 7.1 per cent.

Finance. Mexico still needs capital to develop her resources and give employment to labor. A great deal of foreign capital is invested in the country, but much more will be required before the natural resources are adequately developed. Upon the achievement of independence it was seen that the colonial financial system was inadequate and unadaptable to the new Republic, and the inexperienced government had to improvise and try new methods, with the result that the finances fell into a chaotic state. Lack of railways and other internal developments and continually disturbed political conditions served to continue this state and caused Mexico's credit to fall very low in the money markets of the world. On account of her finan-

cial difficulties and under pretext of protecting the interests of European bondholders, France, England, and Spain intervened in Mexico with an armed force in 1861. After the withdrawal of England and Spain, the Emperor Napoleon III proceeded to carry out his plan, formed beforehand, of setting up an empire under Maximilian in 1864. It was not till peace and order were established, after 1877, that Mexico's credit began to revive and that the revenues finally reached an amount sufficient to pay the public expenses.

At the close of the fiscal year June 30, 1896, Mexico was able for the first time since achieving independence to show a surplus of \$6,000,000. The obnoxious tax called *alcabalas*, or interstate duties on domestic and foreign commerce, was a great drawback to internal trade and was finally abolished on July 1, 1896. The country was then in such a condition that radical financial and other reforms might be introduced without danger of serious disturbances.

The per capita expenses are necessarily large, as the population is small in proportion to the vast extent of coast line and the large area requiring army, revenue, lighthouse, and police services; and only a small part of the inhabitants are wealth producers, the burden of taxation falling chiefly upon a fourth or a third of the people. It is only since 1888 that the reorganization of the federal treasury has enabled that office to keep correct and complete accounts of the public expenses. The following is a statement of the national receipts and expenditures, in Mexican silver pesos, for several fiscal years:

FISCAL YEARS	Revenues	Expenditures
	Pesos	Pesos
1891-92.....	64,653,630	64,624,084
1900-01.....	62,998,805	59,423,006
1904-05.....	132,997,000	109,132,000
1908-09.....	98,775,510	92,967,393
1910-11.....	111,142,401	100,913,923
1912-13.....	120,958,902	110,781,871

A large portion of the annual surpluses has been expended on public improvements, with a view to developing the country. Financial conditions were considerably disturbed, on account of the revolutionary movements, from 1910 to 1915. The budget for 1914-15 estimated the expenditures at 152,204,898 pesos.

The federal revenue is derived chiefly from the import and export duties, the stamp tax, the direct taxes payable in the federal district and the territories, the federal contribution (a surcharge of 20 per cent on all state taxes), excises on gold and silver, tobacco, alcoholic beverages, cotton yarn and textiles, and petroleum, and the earnings of the posts and telegraphs. The duties levied on foreign trade are highly protective and yielded in 1912-13 about 41 per cent of the revenue. Export duties are levied upon some of the largest exports, such as henequen, cabinet and dye woods, and vanilla. In 1912-13 the internal taxes collected through the use of stamps supplied about 24 per cent of the receipts, and the direct taxes levied upon the real estate, scientific professions, and industrial establishments of the federal district, together with other items, made up the remainder. Taxes on the professions vary from 50 cents to \$20 a month. In the above year about 33 per cent of

the revenues was expended by the Department of Finance and Public Credit, 25 per cent by that of War and Marine, 6 per cent by that of Public Instruction, and lesser amounts by the other departments. On June 30, 1913, the public obligations comprised a foreign debt of 310,105,945 pesos and an internal debt of 134,197,810 pesos.

The revenues of the Mexican states, derived chiefly from taxes on real estate, amounted in pesos in 1907 to 29,002,497, varying from 264,855 in Colima to 3,504,391 in Yucatan. The municipalities had an income of 19,073,620 in this same year.

Population. Mexico consists of 27 states, 3 territories, and the federal district, and had a population of 15,112,608, or 19.7 per square mile, in 1910; 1920, 15,115,612. It is difficult to take a correct census because many people, especially the Indians, fear that they will be taxed if they are enrolled in the census returns. The table on page 543, compiled from the *Mexican Year Book* for 1914, gives the names of the states and territories, named in order from north to south in each group, area, population, density of population as given in 1910, the capitals and their populations.

About 19 per cent of the population are pure white, 43 per cent mixed bloods, and 38 per cent Indians. The cold lands, being the most healthful, have the densest population, about 75 per cent of the total population; a relatively small part of the people, from 15 to 18 per cent, live in the temperate zone, and only 7 to 10 per cent in the torrid zone. The first census in 1795 showed a population of 5,200,000. Thus in a little over a century the population has nearly trebled. The increase of the Indian population is comparatively slow because, though the Indians have large families, they are subject to many epidemics. The foreign population numbers over 100,000, Americans, Spaniards, English, and Germans being the most numerous. Many branches of business are monopolized by the English, Germans, and French. The country is to some extent being Americanized as far as means of transportation, electric lighting, improved hotels, and other modern conveniences are concerned. The tendency of the people, however, is to cling to the old habits which grew out of their Spanish ancestry and climatic environment. They still desire their midday siesta, their religious feast days and holidays, but they are unwilling to live abstemiously, spending their money freely and dressing poorly. This is especially true of the Indians.

Immigration and Public Lands. Immigration has been left largely to itself, the government having made little official effort to encourage it, other than to enact laws providing favorable conditions for immigrants. With respect to colonies more has been done. Numerous French, Italian, German, Mormon, and Boer colonies have been formed, under special privileges from the government, and on the whole have done well. The new Immigration and Colonization Law of March 1, 1909, provided for the exclusion and deportation of undesirable persons, including those likely to become public charges, fugitives from justice, except for political offenses, and anarchists. Special regulations were also made for the admission of immigrant laborers and the supervision of transportation lines carrying them, with a view to preventing the entry of those who are physically

unsound. The movement of passengers at the sea and land ports of the Republic in 1907 gave a net increase to the population of 13,394, most of whom were from the United States. The low rate of wages, the fact that a large portion of the public lands is already disposed of, the lack of adequate surveys, the inability to secure lands in small tracts, and the unwillingness of the large landholders to divide their estates are the obstacles to a large immigration. The Land Law (March 26, 1894) divided the public lands

There were 18,617 supervisors and teachers in the primary and secondary schools. The professional schools include law, normal, agricultural, commercial, medical, fine arts, arts and trades, engineering, military, and naval schools. The Mexican University, founded in 1553 and dissolved in 1862, was reorganized in 1910 with the various faculties, and is now at the head of the educational system of the country. There were also, in 1907, 2561 private and clerical schools, with 174,880 pupils, giving all grades

* Includes Quintana Roo.

into four classes, provided regulations for the denouncement and acquisition by Mexicans and for the lease by others, and exempted from alienation the seashore, banks of navigable rivers, and lands having monumental ruins. Under this law 3,553,732 hectares were granted by the government from 1901 to 1907. Owing to vagueness and inaccuracy of the data which the government possessed regarding public lands, the law was suspended by Congress in 1909. The surveying of public lands was placed under the direction of the Agrarian Commission at this date. The land question was one of the important factors in the revolutionary movements following the downfall of Diaz.

Education. In all the states education is free and compulsory in the primary grades; illiteracy, however, is very prevalent, and little has been done to educate the Indians. The table opposite shows the status of the educational establishments of the Republic in 1907.

of instruction from primary to professional. The public and private libraries are notable, the largest of them, the National Library, containing 200,000 volumes; there are 186 other public libraries, 38 museums for scientific and edu-

ational purposes, 11 meteorological observatories, 56 scientific and literary societies, and 1571 periodical publications, including 53 in

English, 6 in Spanish and English, 3 in Spanish and Latin, 3 in French, and 1 in German. Mexico is one of the first countries of Latin America in artistic, literary, and scientific advancement.

Religion. One of the motives of Spanish colonization was the conversion of the natives to the Christian faith. Upon the site of the heathen temple of Tenochtitlan arose the cathedral of Mexico. The Franciscan Order was the first to begin work in Mexico (1524), and was soon followed by the Dominicans and other orders. In 1527 Fray Juan Zumarraga was made the first Bishop and in 1545 the archbishopric of Mexico was created. The Inquisition was established in 1571, but the Indians were exempt from its jurisdiction. The following years the Jesuits came. There were many able churchmen as well as many who were corrupt, and during the colonial régime the church wielded a powerful influence. It was occupied with the conversion of the natives and the care of the religious life of the Spaniards, and had charge of the schools, hospitals, and asylums of the viceroyalty. In 1767 the Jesuits were expelled from Mexico as well as from all the other Spanish American colonies. During the wars of the independence a number of priests, such as Hidalgo, Morelos, etc., were active leaders in the movement, and in the establishment of the Empire of Iturbide the church played a large part. The Inquisition was abolished in 1820. Since the independence the church has sided with the conservative element and has always been an active factor in the disturbances which have torn the country. During the colonial times and after it amassed great wealth and in the middle of the nineteenth century was said to possess about one-third of the real and personal property of the Republic. These conditions created no little antagonism to the church and as a consequence the constitution of 1857 provided for freedom of religious opinion. Two years later, the Laws of the Reform, issued by Juárez, brought about the complete separation of the church and state and the confiscation and nationalization of the property of the church. Since that date the Roman Catholic church has continued to exercise much influence in the affairs of the nation, as the majority of the people are still under its teachings. Nevertheless a considerable portion of the Mexicans have drifted away from or become antagonistic to the Roman Catholic church. It had, however, in 1910, 3 archbishops, 18 bishops, over 9000 churches and chapels, and 12,664,182 adherents. The Protestants began work in Mexico in 1867 and now have churches in all parts of the Republic. In 1910 they had 294 foreign missionaries, 529 native workers, 563 stations and substations, 24,771 communicants, 92,156 adherents, 139 day schools with 7640 pupils, 30 higher institutions with 4108 pupils, and 8 hospitals and dispensaries.

Government. The present constitution of Mexico was adopted by a constituent assembly on Feb. 5, 1857, and has undergone various amendments extending down to the year 1908. It is a written instrument of great length and is closely modeled after the Constitution of the United States. The declaration of the "rights of man" is the most complete document of its kind. Its 29 articles include personal freedom, freedom of speech and of the press, right of assembly and petition, right of bearing arms, guaranty of the rights of accused persons on

trial for the commission of crime, including fair and speedy trial and exemption from special tribunals, and immunity from the operation of retroactive laws, laws which impose excessive fines or inflict unusual punishments and which take private property without compensation. In case, however, of great public danger from insurrection or invasion the President of the Republic, in concurrence with the Council of Ministers and with the approval of Congress, may suspend these guaranties for a limited period.

The government of Mexico is a democratic, federal, representative republic, composed of 27 states, 3 territories, and a federal district. The constitution provides for a distribution of the powers of government among legislative, executive, and judicial branches. The legislative power is vested in a Congress consisting of a Chamber of Deputies and a Senate. The Chamber of Deputies is composed of members elected by indirect secret ballot for a term of two years on the basis of one Representative for every 40,000, or fraction over 20,000, of the population and by an electorate which consists practically of all male adults. The qualifications for a deputy are citizenship and the full enjoyment of all the rights incident thereto, the attainment of the twenty-fifth year, and residence in the state from which he is chosen. Ecclesiastics are disqualified. The Senate is composed of two Senators from each state and two from the federal district, chosen in the same manner as the Representatives and possessing the same qualifications, except that the Senators must have attained the thirtieth year of age. The terms of one-half the Senators expire every second year. Both Senators and Representatives receive annual salaries of \$3000 (which cannot be renounced) and are privileged from arrest for opinions expressed in the discharge of their duties. Each House is the judge of the election and qualifications of its own members. Two ordinary sessions of Congress are held annually, beginning respectively in April and September. The two Houses enjoy substantial equality of powers in legislation, except that financial and revenue measures and bills for the recruiting of troops must be first discussed in the Chamber of Deputies. Legislative measures may be initiated by the President of the Republic, the state legislatures, and by individual Senators and Representatives. Bills vetoed by the President, but subsequently passed by an absolute majority of each House, become law in spite of the executive veto.

The powers of Congress are enumerated with great specification in the constitution. They include the admission of new states to the Union, the erection of new states within the limits of old states, legislation regarding the federal district and territories, the levying of taxes, the issuing of mining and commercial codes, the maintenance of the army and navy, the declaration of war, the enactment of laws in regard to citizenship, naturalization, colonization, emigration, immigration, and general health of the country, the coinage of money, the regulation of weights and measures, the granting of pardons, and the enactment of all laws necessary and proper to the execution of the enumerated powers. The exclusive powers of the Chamber of Deputies include the exercising of the powers prescribed by law regarding the election of the President and Vice President of the Republic,

the judges of the Supreme Court, and the Senators from the federal district, the consideration and decision upon resignation and leave of absence of the President and Vice President, and the resignation of judges of the Supreme Court, supervision of the General Auditing Department, the approval of the annual estimates of expenses, and the impeachment of the President, secretaries of the departments, Senators, Representatives, judges of the Supreme Court, and governors of states for the commission of crimes during their terms of office. The exclusive powers of the Senate include the approval of treaties with foreign Powers, the ratification of nominations made by the President to important offices, the decision as to whether the status of a state government is such as to require the appointment of a provisional Governor, the decision of political conflicts within a state, and the trial of impeachments preferred by the House of Representatives. During the recess of Congress some of its important functions are discharged by a Permanent Deputation, composed of 15 Deputies and 14 Senators.

The executive power is vested in a President, or upon his default or absence on leave in a Vice President, who also is ex-officio President of the Senate. The President and Vice President are chosen indirectly by electors, who are themselves popularly elected, for a term of six years. Their qualifications are citizenship by birth, the full enjoyment of civil rights, the attainment of the thirty-fifth year, and residence in the country at the time of the election. In case of the default of both President and Vice President, either at the beginning or during the presidential term, the Secretary of Foreign Relations becomes the acting President and Congress calls for a new election, except when the default occurs during the last year of the presidential period. The office of President cannot be resigned except for grave cause, and then only with the approval of Congress. His chief powers are: to promulgate and execute the laws; to appoint and remove freely the Secretaries of State and all federal officials not otherwise provided for in the constitution or laws; to appoint with the approval of Congress ministers, diplomatic agents, consuls general, and the higher officials of the army, navy, and treasury; to declare war with the consent of Congress; to dispose of the army and naval forces; to grant letters of marque and reprisal; to negotiate treaties with foreign countries; to receive ambassadors and ministers; to call special sessions of Congress with the consent of the Permanent Deputation; to grant pardons; and to grant exclusive privileges to discoverers and inventors. In carrying out the work of administration the President acts through a cabinet composed of eight secretaries, who serve as heads of the departments of Foreign Relations, Interior, Justice, Public Instruction and Fine Arts, Promotion, Communication and Public Works, Finance, Public Credit and Commerce, and War and Marine. Every order, decree, or regulation of the President must be signed by one of the cabinet secretaries in order to be valid. The members of the cabinet do not occupy seats in Congress and their responsibility to that body extends only to criminal acts.

The judicial power of the Republic is vested in a Supreme Court and in district and circuit courts. At present the Supreme Court consists of 15 judges chosen by electors for a term of

six years. They must be native-born citizens 35 years of age and learned in jurisprudence. They are required to take an oath to administer justice loyally and patriotically, and may resign only with the approval of Congress. The organization of the district and circuit courts is determined by statute. The jurisdiction of the federal courts extends to cases involving the application of federal law; to maritime cases; to cases in which the Republic is a party; to cases in which a state is a party; to cases arising under treaties with foreign Powers; and to cases concerning diplomatic agents. In those cases in which the Republic or a state is a party, and in those cases in which the question of jurisdiction arising between the state and federal courts is involved, the Supreme Court has original jurisdiction. In all other cases it has appellate jurisdiction.

The individual states of the Mexican Republic have a large degree of local autonomy, although the federal constitution requires that they shall adopt the popular, representative, republican form of government. They have their own constitutions and codes of laws, their own governors and unicameral legislatures, and local officials. They are allowed to regulate with one another their own boundaries subject to the approval of Congress. They may not form alliances or treaties with one another, grant letters of marque and reprisal, coin money or issue paper currency, tax the transit of persons or goods crossing their territory, lay duties on interstate commerce, or without the consent of Congress levy tonnage duties, keep troops or ships of war, or wage war except in case of invasion or peril so imminent as to admit of no delay. Each state is under an obligation to deliver without delay criminal refugees from other states and to give full faith and credit to the public acts, records, and judicial proceedings of every other state. It is made the duty of the state executives to publish the federal laws and cause them to be obeyed. On the other hand, it is made the constitutional duty of the federal government to protect the states against invasion or domestic insurrection upon request of the Legislature of the state concerned or of the executive if the Legislature be not in session. As in the United States, all powers not expressly conferred upon the federal authorities are reserved to the individual states. Similarly the federal constitution, the laws of Congress, and all treaties made in pursuance thereof are declared to be the supreme law of the whole Union, and the judges are bound thereby, anything in the constitutions or laws of the states to the contrary notwithstanding.

Amendments to the federal constitution may be proposed by Congress, two-thirds of all members present concurring. If approved by a majority of the state legislatures, they shall be a valid part of the constitution.

Money, Weights, and Measures. The currency law of 1905 placed Mexico on a practically gold basis. The theoretical unit is the gold peso, equal to \$0.4984 United States currency. The silver peso has the same legal value as the gold peso and is of unlimited legal tender. The metric system of weights and measures was introduced in 1856 and was made compulsory in 1905. Before this latter date the old Spanish denominations were in current use.

Army. Since the resignation of General Porfirio Díaz as President, in May, 1911, the

country has been torn by revolution and counter-revolution, accompanied by a gradual disintegration of the federal army organized and maintained by him. The armed forces of opposing revolutionary leaders include individuals and units formerly belonging to the federal Mexican army. Notwithstanding these conditions, however, it may be assumed that the details of organization and conditions of service are, in the case of organized armed bodies, somewhat similar to those in existence under the régime of Díaz in 1911, as described below.

Higher Organization.—In time of peace the regiment is the highest unit. Divisions are formed in war. General officers in peace: 7 generals of divisions, 41 generals of brigades, 55 brigadier generals. During the revolutions the number of generals enormously increases. **Infantry.**—All organization in Mexico is peculiar. The underlying principle is to arrange for the maximum expansion in war. The battalion has 4 companies. In peace the battalion is commanded by a colonel, with staff, which is expanded to a regiment by the addition of a battalion in war. In peace there were 34 battalions. Peace strength of company is 9 officers and 145 men. Total infantry, 1182 officers and 19,144 men. War strength of regiments, 47 officers and 1745 men. Total infantry strength in war, 3100 officers and 53,706 men. **Field Artillery.**—The artillery has 2 batteries to the battalion and 2 battalions to the regiment. There are in peace 1 regiment (4 batteries) of mountain artillery, 1 regiment (4 batteries) of horse artillery, 2 regiments (8 batteries) of light artillery, and in addition a so-called "squadron" of rapid-fire guns. Total peace batteries, 16, plus 1 skeleton mountain artillery regiment. Batteries have 6 guns, except horse batteries, which have 4. Peace strength of batteries varies between 6 officers and 79 men and 8 officers and 120 men, except the mountain batteries, which have 10 officers and 88 men. Total peace strength, 1912 officers and men. Upon mobilization the mountain artillery doubles, other regiments form 2 additional batteries. Total war strength, 1347 with 176 guns. **Cavalry.**—In peace 4 troops form a regiment at full peace strength, and 2 troops form a regiment at skeleton strength. Peace footing of troops, 6 officers and 72 men or 8 officers and 105 men. There are 14 regiments and 4 skeleton regiments. Total peace strength, 496 officers and 6822 men. In war each regiment is expanded to 6 troops. War strength of a troop, 5 officers and 140 men. **Coast Artillery.**—Unimportant detachments. **Technical Troops.**—War strength, 100 officers and 1000 men. **Train.**—Peace, 9 officers and 206 men; war strength, not known. **Sanitary Troops.**—No data. In addition to the regular troops there are 12 regiments of rurales, or military police, of 250 men each. Total peace strength, between 31,000 and 32,000. Total war strength, 100,000 officers and men. **Conditions of Service.**—In theory service is compulsory. Actually conscription is made to apply only to some of the lower and criminal classes. Upon mobilization conscription could be resorted to. **Arms.**—Infantry, the Mauser magazine rifle. Cavalry, Mauser carbine. Reserves, Remington rifle of 1893. Field and horse artillery use quick-fire guns of the Schneider-Canet system. Budget for 1910-11, 10,890,000 pesos.

Peoples of Mexico. The population of Mexico at the present day is largely Indian, and in

many parts of the country ancient customs, superstitions, and languages hold sway. It is impossible to estimate the exact proportion of pure Indian blood, mestizo, or mixed blood, and white; probably there are about 5,000,000 pure-blooded Indians and a somewhat larger number of mestizos. Dr. León divided them into 17 families and 180 dialects, and was of the opinion that future studies would reduce this number of families to three mother tongues—the Otomi, Maya-Quiché, and the Nahuatl. Recent work has so far not justified this opinion. A number of stocks are totally extinct and little material is available for the study of them. In many parts of the Republic where certain languages are spoken over extended areas we find dialectal differences in every village. In some parts of Mexico the tribes occur in masses, while in other parts people speaking different languages are strangely intermingled. In the same town, separated by a single street, we may find two different languages spoken, while in one town Starr reports Aztecs, Otomi, Tepehuas, and Totonacs, each group keeping its independence in language, dress, customs, and beliefs, and occupying its own distinct quarter of the town.

Most of the Mexican Indians have been converted to Christianity; some are still idolaters, but have lost much of their knowledge of ancient traditions and religion. These are superstitious to a degree and believe in omens, witchcraft, and divination. Among the Huicholes, whose habits, customs, religion, and symbolism have been studied by Lumholtz, among the Mixes, who have been investigated by Starr and Belmar, and among the Lacandonese, known through the field work of Tozzer, we find greater adherence to primitive ideas than among other Mexican peoples.

All over Mexico the commerce is carried on in very much the same manner as before the Spanish Conquest. Each town has its market place where a fair is held at regular intervals. The natives carry merchandise for long distances, to attend annual festivals of certain saints, whose modern shrines are built on the sites of ancient temples. The Indians are principally agriculturists, though certain aboriginal trades still prevail, such as weaving, basket and mat making, and the manufacture of pottery; and the products of these industries, for which certain villages are noted, are distributed throughout extended areas. Their mode of living, habitations, and clothing have changed but little under white influence. Their food consists mainly of corn, beans, and chili peppers; the corn is made into cakes, or tortillas, or a thin mush called posole; their food is prepared as before the Conquest, although to a certain extent cooking vessels of tin and iron are used as well as those of clay. Their great vice lies in the use of alcoholic stimulants; they make many native drinks as in former times, and on every possible occasion they indulge in their use.

History. The events of prehistoric Mexico are confused in a mass of myth. Legend carries the story of the Toltecs, the first historic race, back to the early centuries of the Christian era, when they began their migration, which finally led them, about the year 754, to the valley of Mexico. Here they founded the cities of Tulan and Tulantzinco, of which vast ruins still exist some 50 miles north and northwest of Mexico City. In the year 1064 the Toltec power was overthrown and they were eventually

driven from the country, going off towards the south, where they are supposed to have erected some at least of the immense buildings now in ruins in Yucatan, Honduras, and Guatemala. Their conquerors, the Chichimecas, first appeared in the vicinity of the two great volcanoes, Popocatepetl and Ixtaccihuatl, where the ruins of Amecameca show the centre of their power. After they succeeded the Toltecs as the dominant power, the Chichimecas settled at Texcoco, on the east side of the lake of that name, where they were living in a flourishing condition when, late in the twelfth century A.D., seven allied Nahuatlaca families or tribes entered the valley from the north, having started on their wanderings, quite possibly, in the cliff-dweller region of the modern New Mexico and Arizona. The Aztecs, the principal of these tribes, finally made a settlement at Tenochtitlan, on some marshy islets in Lake Texcoco, probably in the year 1325. It is said that this location was pointed out by a sign from the gods, an eagle perched upon a prickly-pear cactus, the nopal, strangling a serpent. This sign is now the national seal of Mexico. Tenochtitlan grew stronger, the islands were enlarged, and causeways were built to connect them with the mainland. By the time of the election of the first king or war chief, in 1376—the earliest authentic date in Mexican history—the Aztecs had won a position of influence in the valley. Huitzilihuitl, who was chosen chieftain or king in 1404, and his brother Chimalpopoca (1417–27), who succeeded him, greatly increased their power by intermarrying with the rival tribes and establishing trade relations, as well as by their successful battles. Itzcoatl (1427–40) (q.v.) rendered the dominant position of the tribe more secure by the formation of a confederacy with the Chichimecs and Tepanecs, for the purpose of conquering their outlying neighbors and forcing them to pay tribute. Montezuma I (1440–69) (q.v.) was perhaps the first chief to combine the war and priestly functions, and prepared for the downfall of the tribal power by allowing the latter to interfere with the former. His successors, Axayacatl, Tizoc, and Ahuizotl, considerably extended the influence of the tribe by conquering the tribes beyond the mountains, to the two seas on the east and west, and far towards the south, and forcing them to render tribute of slaves for the sacrifices which were becoming the established and popular religious practice of the Aztecs.

In 1502 Montezuma II was elected to the chief position in the tribe. (For an account of Montezuma's career and the invasion of Mexico by Cortés, see MONTEZUMA II; HERNANDO CORTÉS.) In November, 1519, Cortés entered Tenochtitlan—Mexico—and before the end of the month he had secured the person of the Mexican "Emperor," whose subjects soon fully realized that the white men would have to be expelled by force, and quickly commenced hostilities under the leadership of Montezuma's younger brother, Cuitlahuatzin (q.v.), and the Emperor's nephew, Guatemotzin (q.v.), or Cuahquemoc. On the *Noche Triste*, or "dreadful night," June 30, 1520, Cortés withdrew from the city of Mexico, and for a time his position was desperate, but the indomitable valor of the Spaniards enabled them to return to the attack. Cuitlahuatzin, Montezuma's successor, died in November, 1520, and was succeeded by Guatemotzin, whose heroic defense of the city

of Mexico during the following year remains one of the noblest episodes in American history. Cortés began his siege of Mexico in May, 1521, and after the capture of Guatemotzin in August he set promptly to work at rebuilding the city. The dead bodies were burned and the city roughly cleansed, the canals filled up, streets, market places, and the sites for a church, fort, official residence, and other necessary buildings located. As an administrator Cortés was less successful than as a military leader, and the repeated complaints and threats against his rule led him to go to Spain to present his case at court. Military governors failed to control the affairs of New Spain, as Mexico was officially called, and the first Audiencia (1528) had no better success. The second Audiencia (1529) managed the government until 1535. In this latter year the Spanish colonial government reached its definitive form by the appointment of the first Viceroy of New Spain. The first incumbent, Antonio de Mendoza, "the good Viceroy," was intrusted with extensive powers and did much to advance the country and assure its permanent strength and welfare. Luis de Velasco succeeded to the viceroyalty in 1550, and during his administration the University of Mexico was founded (1553) and the mineral and other sources of wealth developed. Then followed a series of 61 viceroys who ruled the destinies of New Spain. Most of the viceroys were of noble family, some were able and wise, many were of the mediocre type of colonial officials, and not a few were corrupt and oppressive in their administration. On the whole New Spain enjoyed such prosperity as was possible under the monopolistic policy pursued by Spain in her colonial government. During the viceregal period the conversion of the natives was carried on, Indian revolts, which occurred from time to time, were suppressed, the exploration and settlement of New Mexico, Texas, and California were carried out, peaceful progress was made in agriculture and mining, commerce was developed as much as was possible under the restrictive system of Spain, conflicts of jurisdiction were settled, the disputes of the secular and ecclesiastical officials were adjusted, and the periodical inundations of the capital made necessary plans for draining the valley, which were formed by the Viceroy Velasco and completed by President Díaz at the opening of the twentieth century. In the eighteenth century many of the restrictions on trade were removed, the office of Intendant was established, and the second Count of Revilla Gigedo (1789) introduced many beneficent reforms in Mexico City. While carrying on these embellishments the ancient Mexican calendar stone and sacrificial block, which had been buried at the time of the Conquest, were discovered.

The gradual increase of education among all classes, the spread of liberal and revolutionary ideas, introduced from the United States, France, and England, the introduction of the liberal administrative reforms by Charles III, the chaotic conditions existing in Spain and the decline in the power of the home government, and finally the establishment of the supremacy of Napoleon in Spain, were the causes which contributed to the independence of Mexico. On Sept. 16, 1810, Miguel Hidalgo y Costilla (q.v.), the parish priest at Dolores, near Guanajuato, learning that the conspiracy in which he was

involved had been discovered, rang the church bell and called upon his people to follow him and free Mexico from foreign tyranny. His *Grito de Dolores*, the cry of "Long live religion! Long live our Holy Mother of Guadalupe! Long live America, and death to bad government!" marked the beginning of the struggle for Mexican independence. Hidalgo, after a series of successful fights with scattered Royalist forces, was defeated, driven north, and finally caught and shot at Chihuahua (July 30, 1811). His pupil, Morelos (q.v.), took up the leadership and became known as the "hero of a hundred battles." He assembled a congress at Chilpanzingo (Sept. 15, 1813), which abolished slavery and religious tithes, and issued a declaration of independence from Spain. Later he was defeated by the Royalist army under Agustín de Itúrbide (q.v.), betrayed by one of his followers, and shot in December, 1815. In 1817 Javier Mina invaded Mexico from Tamaulipas and maintained the fight for independence with the usual temporary success, until defeated, captured, and shot (November 11). Meanwhile Vicente Guerrero (q.v.) had gradually been establishing his claim to be the natural and most able leader of the Independents in the field, while among all classes in Mexico the feeling was growing more and more strong that the Spanish power must be done away with. Itúrbide determined to unite the two parties, and by the Plan of Iguala (Feb. 24, 1821) in which Guerrero and the Spanish Viceroy, Juan O'Donojú, joined, proposed an independent monarchy with a ruler from the Spanish royal family. The plan failed; no ruler could be secured from Europe, but independence had been practically and peacefully assured. Itúrbide arranged a popular demonstration, and the Congress ratified his choice of himself as Emperor (May 19, 1822). The older Independents soon refused to acknowledge his Empire, and on March 20, 1823, the opposition forced his resignation. An executive council of four revolutionary leaders, Nicolas Bravo, Guadalupe Victoria, Pedro Negrete, and Vicente Guerrero, managed affairs during the next year, calling for the election of a congress, which, on Oct. 4, 1824, proclaimed the first constitution of the Republic of Mexico. Guadalupe Victoria, the first President, gave the country a popular administration and a large measure of prosperity and was allowed to serve out his full term. In 1828 the election was bitterly contested by the Federalists or Liberals and the Centralists, aided by the Moderates and Conservatives. The Centralist candidate, Manuel Gómez Pedraza, was elected President, but a revolt under Antonio López de Santa Anna (q.v.) prevented his accession and his opponent, Vicente Guerrero, was installed in the presidency (April, 1829). Before the end of the year Guerrero was forced out and his Vice President, Anastasio Bustamante, was placed in control of the government.

Then followed a half century of internal disorder; revolution followed revolution; plans and pronunciamientos were issued by every political leader; Conservative and Liberal, Centralist and Federalist, Imperialist and Republican, carried on a seemingly endless struggle for power. For more than 20 years Santa Anna was the central figure in Mexican politics. At will he openly controlled the government as President or Dictator, or managed affairs while ostensibly in

retirement. He sided with the Conservatives and Centralists and in 1843 dissolved Congress and assembled a Council of Notables, which formulated the Bases Organicas de 1843, a new reactionary conservative constitution. In 1836 Texas achieved her independence and 10 years later the war between Mexico and the United States broke out. The invasion of Mexico was rendered relatively easy by the repeated internal dissensions which absorbed most of the attention of the Mexican commanders. Twelve changes in the chief executive during the two years of the war prevented the Mexicans from offering any effective resistance, notwithstanding their admirable fighting qualities. The city of Mexico was occupied (Sept. 13, 1847), and in the Treaty of Guadalupe Hidalgo (q.v.) Mexico suffered heavy loss of territory. Santa Anna was the leading factor in affairs until August, 1855. General Ignacio Comonfort (q.v.) was installed as President in December and in June, 1856, issued the decree ordering the sale of all unimproved church lands, which precipitated the struggle between church and state. On Feb. 5, 1857, a new constitution, which, with its various amendments, is still in force, was adopted by Congress. Comonfort swore to defend the constitution, but, coming under the influence of the Reactionary party, he set it aside in January, 1858, and endeavored to govern the country under the Bases of 1843. A revolt under Gen. Félix Zuluaga drove him into exile. Benito Juárez (q.v.), the legitimate successor of Comonfort, assumed the presidency and proceeded to reestablish constitutional government. The War of the Reform (of the church) broke out with all the fury of a religious warfare and in the midst of it Juárez issued his decree nationalizing all church property and separating the church and the state (July 12, 1859). The Constitutionalists, under General Ortega, decisively defeated the Reactionaries under Miramón, at Calpulalpam (Dec. 22, 1860), and a few days later Juárez entered the capital. Juárez proceeded to reorganize the internal administration of the country, but brought foreign war on the country by decreeing the suspension for two years of the payments on the foreign loan. The act, wise and perhaps necessary in itself, was not managed with diplomacy, and on Oct. 31, 1861, England, France, and Spain entered into the Convention of London, by which they agreed upon joint action for the protection of their interests in Mexico. An expedition was dispatched and Vera Cruz was occupied, but in February, 1862, when it became evident that Napoleon was scheming to establish an empire, supported by France, in America, England and Spain withdrew their forces. Thereupon the French came out openly against the Mexican government and were joined by the Reactionists and Monarchists, who were naturally hostile to Juárez. On May 5, 1862, a French army of 6000 men under General Lorenz was defeated before Puebla (the famous Cinco de Mayo) and was compelled to retreat to Orizaba. In September the arrival of reinforcements raised the French strength to 12,000 men. In May, 1863, a combined force of French and Mexicans, under the French General Elias Forey, captured Puebla and marched upon the capital, which fell into their hands on June 10 after Juárez and his cabinet had fled. Forey selected 35 citizens to act as a Supreme Council of the Nation. This body at once formed a

regency composed of Gen. Juan Nepomuceno Almonte (q.v.), Gen. Mariano Salas, and Archbishop Labastida, which was intrusted with supreme authority. On July 10 an Assembly of Notables at Mexico proclaimed Mexico an empire and tendered the crown to Maximilian, Archduke of Austria, brother of the Emperor Francis Joseph. (See MAXIMILIAN, FERDINAND JOSEPH.) Maximilian accepted the crown on condition that the action of the Assembly of Notables be ratified by a vote of the Mexican people. As a French army of 35,000 was present in the country, there was little difficulty in obtaining this. On May 29, 1864, Maximilian and his wife landed at Vera Cruz and on June 12 the sovereigns entered the capital, taking up their residence at Chapultepec, where they established a court with all the regalia and forms of a European dynasty. In the field the French troops under Bazaine, who had assumed command in October, 1863, gained a number of successes over the Patriot forces, and drove Juárez from place to place until he finally established his capital at El Paso del Norte on the United States border. In the desperate guerrilla warfare which the Nationalist forces waged against the invaders a large part of the country was devastated. Maximilian seriously undertook the task of governing the country and tried to reconcile the various parties, but in this he failed and by the end of 1865 he found himself, despite his efforts to win the good will of his subjects, with no real support except that of the French soldiers. Meanwhile the United States had convinced Napoleon III that French troops would not be suffered to interfere in American affairs. On May 31, 1866, Maximilian received word that the French army was to be withdrawn. He at once decided to abdicate, then changed his mind, at the instigation of the Empress Carlotta, who hastened back to Europe, where her failure to secure any help caused her to become insane. Maximilian again considered withdrawing, but the clericals urged him to remain and a council of leading Imperialists advised against the step, and eventually he determined to stay by his Empire and the supporters who remained true to him. As fast as the French troops were withdrawn from the northern part of the country, Juárez occupied the territory, re-formed his army, and awaited the final departure of the French (March, 1867). Maximilian removed the Imperial government to Querétaro, where the troops under Márquez, Miramón, and Mejía were assembled. The city was immediately surrounded by the Republicans and a siege begun on March 12, 1867. Márquez broke through the enemy to bring assistance from Mexico, but instead undertook to establish a power for himself at Puebla, where he was defeated by Porfirio Díaz, who drove him back to Mexico and then captured that city. On May 15 Maximilian was betrayed by one of his most favored officers, Col. Miguel López, who arranged the admittance of the enemy into the Imperial camp. The Emperor was forced to surrender, was tried by court-martial, and was shot, with Generals Mejía and Miramón, on June 19, 1867.

After four years Juárez entered the city of Mexico, on July 15, 1867, and began the reorganization of the Republic. A presidential election having resulted in no choice, Congress confirmed Juárez in that office, which he held till his death in 1872.

Sebastian Lerdo de Tejada (q.v.), the president of the Supreme Court, then succeeded to the presidency amidst great popularity. He pursued a policy of absorption of the states' rights and usurpation of power and prepared for his own reelection in 1876 by having dictatorial powers granted. This was the signal for a new revolution and Gen. Fidencio Hernández issued the Plan of Tuxtepec (Jan. 15, 1876), which was adopted in a modified form by Gen. Porfirio Díaz, as the Plan of Palo Blanco (March 21). This latter plan included declarations in favor of the maintenance of the constitution of 1857 and the reform decrees of 1873, the nonreelection of President and state governors, a new presidential election, and the repudiation of Lerdo de Tejada. Díaz defeated Lerdo de Tejada in the battle of Tecuac (November 16), entered the capital, and on November 28 assumed control of the executive power. The following year he was elected President for the unexpired term and began his long career as the ruler of the Mexican people. He ushered in a new epoch in Mexican history. He at once set about to insure a stable government, suppressing all opposition, and endeavored to extend the foreign relations of the country. In 1880 Díaz secured the election of his friend Manuel González as President and continued to exercise a power in the administration. The era of peace and prosperity inaugurated in the first term of Díaz continued, but many charges of corruption were made against González, and Díaz was considered as the only man who could properly govern the nation. He was reelected in 1884, and before the end of this term the constitution was changed to allow the reelection of the President and Díaz was chosen for and served out the five succeeding terms. During this period of 26 years, in which Díaz ruled practically as a benevolent despot, Mexico underwent a marvelous development, especially in economic and industrial lines. The public debt was funded and credit abroad was assured; the public revenues were regulated; foreign relations were improved and treaties of amity and commerce were negotiated; educational facilities were extended; the natural resources were developed and exploited; railways were extended; manufacturing plants were established; interstate taxes were abolished; the finances were put on a sound basis and the gold standard was adopted; a new banking law was enacted; and public works, harbor improvements, and public buildings were constructed.

Along with this material prosperity, however, came the development of oligarchical and autocratic tendencies in the government. Under the Díaz régime, both in the national and state governments, there sprang up many abuses, which caused uneasiness and silent protest. As the election of 1910 approached the administration party laid plans for the continuance of Díaz for another term of six years. Rumors of dissent from this arrangement became current, but it was scarcely thought probable that any one would have the daring to become a candidate in opposition to Díaz. No little surprise was occasioned at the publication of a book entitled *La sucesion presidencial en 1910* by Francisco Madero (q.v.), in which he openly attacked the Díaz régime, pointing out its corruption and abuses and declaring that he would wage a political campaign against it. He became the candidate of the opposition and ac-

tively carried on a political campaign of education, using American methods. He was not taken seriously at first by the followers of Díaz, and was repudiated by most of the other members of his own family, the wealthy Maderos of Coahuila. Finally concluding that Madero was an element of danger to the régime, the government caused his arrest upon a minor charge and thus eliminated him from the presidential canvass. On July 26, 1910, Díaz was reelected for his eighth term, with Ramon Corral, one of his ardent supporters, as Vice President. Soon after the election (September 15-25) the centenary of the independence of Mexico was celebrated amidst the most brilliant festivities.

This was the last blaze of glory of the Díaz régime before its collapse. The suppression of Madero was the fact which, added to abuses and oligarchical tendencies of the Científico party, brought on a successful revolution. Madero, having been released from prison and warned from the country, began an active revolutionary propaganda. On October 15 he issued the Plan of San Luis Potosí, which proclaimed the principles of effective suffrage and no re-election, advocated certain land reforms, repudiated the Díaz régime and the election of 1910, and provided for open revolt and the organization of a provisional government. At the time of the actual outbreak in Chihuahua, on November 18, Madero was in the United States, but he at once returned to Mexico and took charge of the movement, which rapidly spread to the other northern states. The year 1911 opened with reverses for the federal government, though it continued to insist that the revolt was of little consequence and would soon be suppressed. The revolutionists demanded the immediate resignation of Díaz. As a reply Díaz, in his message of April 1, 1911, advocated reforms to safeguard the suffrage, reform of the federal judiciary, removal of abuses of the local officials, division of the large estates, and no re-election of the President. Because the fighting was carried on so near the border the United States government early in the year sent a warning to both parties and mobilized troops along the frontiers to guarantee neutrality and protect her interests.

On May 10, 1911, the city of Juárez was captured by the rebels and thereupon the federal government consented to negotiate for peace. The treaty provided for the resignation of Díaz and Corral and the holding of new elections within six months. Madero entered the capital on June 7, was chosen President, and inaugurated on November 6. With the best of desires to remedy the conditions of the country, he proved himself to be unable to cope with the situation. He had no sooner taken his seat as President than revolts broke out. Zapata (q.v.), a guerrilla leader in Morelos, who had led a movement against Díaz, now refused to submit to Madero and continued in arms against the government. Gen. Bernardo Reyes, a defeated candidate for the presidency, also attempted to start a revolt, but failed. A more serious outbreak occurred in February, 1912, in the north. Juárez was captured by the rebels and Gen. Pascual Orozco joined the movement and became its leader. The nearness of the disturbance to the United States frontier and the danger of violations of neutrality caused Congress to authorize and the President to issue an embargo on the shipment of arms to

Mexico. This was later modified to allow shipments to the Madero government. Warning was sent, also, to both Madero and Orozco that they should protect the lives and interests of foreigners. The Federals gained victories in the north during the summer and seemed in a fair way to suppress the revolt, when a new movement took place in the south under the leadership of Felix Díaz, a nephew of Porfirio, who captured Vera Cruz. He was defeated, captured, and sentenced to death, but Madero suspended the sentence and removed Díaz to Mexico City for imprisonment.

Madero endeavored to carry out his programme of governmental reform, but in this he was unsuccessful, largely on account of his own character. Besides, his recognition of the old Congress left to the opposition a very effective weapon and the Científico press waged a relentless campaign against him. On Feb. 9, 1913, revolt broke out in Mexico City under the leadership of Felix Díaz and General Reyes. Sanguinary street fighting and the bombardment of public buildings continued for 10 days, until Gen. Victoriano Huerta (q.v.), the head of the federal army, deserted to the rebels. Madero and his Vice President, Pino Suárez, were arrested and forced to resign (February 19) and four days later they were murdered while being transferred from one prison to another. Huerta then assumed the provisional presidency. He and his followers justified their actions by accusing Madero of corruption, and promised reform in the administration.

Huerta experienced difficulties from the first. A counter-revolution was started in the north, led by Venustiano Carranza, the Governor of Coahuila. Governor Carranza was born in Coahuila in 1859 and was educated for the law. On account of weakness of the eyesight he took up farming, to which he has devoted most of his life. In 1893 he led a revolt against the Díaz Governor of Coahuila and succeeded in escaping with his life. He joined the Madero revolt in 1910 and upon its success became Governor of his native state.

Opposed to the course of events in the capital, Carranza secured extraordinary powers from the state legislature in order to defend the constitution. His scheme called for the establishment of a Constitutional army, and for the institution of several long-needed reforms. The revolt spread rapidly to Chihuahua, Sonora, and Sinaloa, and a Constitutionalist government was organized with Carranza as provisional president. Huerta's difficulties were further augmented by the attitude of the United States government. President Wilson continued President Taft's policy of non-intervention and non-recognition. The American Ambassador to Mexico, Henry Lane Wilson, advocated recognition, but as his ideas differed so widely from those of the President he felt compelled to resign. The President then sent John Lind (q.v.) as his personal representative, to undertake an adjustment of the Mexican situation. Promise of recognition of a new government in Mexico was given on the following conditions: The cessation of hostilities, the guarantee of an early and free election, the promise of Huerta not to become a candidate, and an agreement of all parties to abide by the result of the election. Huerta refused to agree to his own elimination, which was insisted upon and President Wilson adopted a policy of "watchful waiting." By a

coup d'état of Oct. 10-11, 1913, Huerta dissolved congress and assumed dictatorial power. He held an election, which he himself controlled, and was chosen President. President Wilson protested against the character of the election, but Huerta paid no attention to the protest.

In the meantime the Constitutionalists, under Carranza, had carried on an increasingly active campaign and by the middle of 1914 was in a position to threaten seriously Mexico City itself. Both factions were considerably hampered by the attitude of the United States. Protests were lodged with both sides against the disregard for the life and property of foreigners. An embargo was also placed again on the shipment of arms from the United States. Huerta was troubled also by the financial situation. The United States induced the financial world to boycott him and a threatened run on the banks of the country forced him to declare a bank holiday. He was compelled to resort to all means to secure funds.

On April 10, 1914, occurred the Tampico incident which gave a grave international aspect to the Mexican situation. A number of marines of the U.S.S. *Dolphin* were arrested, while landing from a launch flying the United States flag. Although the men were released and an apology made, Admiral Mayo deemed this insufficient and demanded a salute to the flag. President Wilson supported the demand and ordered the fleet to Mexican waters. In the diplomatic exchanges Huerta agreed in principle to grant satisfaction and hoped to secure recognition in the negotiations. Huerta's conditions were unacceptable and President Wilson appeared before Congress on April 20 and asked for authority to use the armed forces of the United States to secure reparation for the insult to the flag. War seemed imminent. The situation was further complicated by the seizure of Vera Cruz by American forces on April 21 to prevent the landing of a cargo of arms from Germany. At this juncture the A. B. C. powers (Argentina, Brazil, and Chile) offered their services as mediators. These were accepted and a conference was held at Niagara Falls, Canada (May 20-June 24). A protocol was drawn up, but it provided no practical solution for either the international or internal difficulties of Mexico.

During the summer months of 1914 the military successes of the Constitutionalists continued. The fall of San Luis Potosí and Manzanillo (July 17 and 24) gave the Constitutionalists control of the last remaining strongholds on the way to Mexico City. Huerta reorganized his cabinet in July and held a presidential election in the territory under his control. He was returned in this by a small majority. On July 15, he resigned the provisional presidency and was succeeded by Francisco Carbajal, Chief Justice of the Supreme Court. The latter at once made overtures for the surrender of the government to Carranza, asking for the assurance of an amnesty. At the suggestion of the United States Carranza finally agreed to the demands of Carbajal and the latter resigned having made Carranza Minister of Foreign Relations so that he might assume control of the provisional government. On August 15, General Obregon occupied the capital and on August 20, Carranza made his triumphal entry.

Factional strife almost immediately broke out. Followers of Carranza and Villa were in open conflict. Zapata, the southern leader, refused to follow Carranza because the latter failed to adopt his plans for agrarian reform. A convention of the Constitutionalist generals was called for October 1, in Mexico City, in order to decide on a plan of action and to choose a provisional President. The convention, after some delay, accepted Carranza's resignation. This action was later repudiated by Carranza and then the Convention declared itself supreme, chose Eulalio Gutierrez provisional President for 20 days, and placed Villa in command of its forces. Carranza was now openly hostile to the convention as was Zapata. The latter seized Mexico City on November 24, but held it only a short time. President Gutierrez continued in power more than his 20 days, but in January, 1915, he was repudiated by the Convention, which assumed control of the government in its own name. Gutierrez still maintained his right to the provisional presidency and Zapata continued to act independently, so that in reality Mexico had four factions, each pretending to control the government. In March the capital was occupied by each of the factions but held for a very short time. On June 2, President Wilson sent a warning to all factions that they adjust their differences and "act promptly for the relief and redemption of their prostrate country" or the United States would be "constrained to decide what means should be employed to help Mexico save herself."

On August 5, the representatives of Argentina, Brazil, Chile, Bolivia, Uruguay, Guatemala and the United States met at Washington to decide upon the course to be pursued in relation to the warring Mexican factions. The conference immediately resolved to send an appeal (August 11) to the leaders of the rival parties, in order to bring to an end the civil war and establish a provisional government. Villa accepted the offer, but after some delay it was rejected by Carranza. The Pan-American Conference met in New York on September 18, and decided that recognition should be given to the Mexican faction which possessed "the material and moral capacity necessary to protect the lines and property of natives and foreigners." The unanimous choice of the conference was Carranza and the Constitutionalists. Before granting recognition certain promises were secured from Carranza. These were: (1) protection of lives and property of natives and foreigners; (2) members of religious orders to be permitted to return and to be secure in life and property on condition that they did not enter politics; (3) that general amnesty be granted to Mexicans, except the real leaders of the opposing factions; (4) that the *de facto* government take steps to restore law and order, to provide for general elections, and the restoration of the Constitutionalist order in Mexico. On Oct. 18, 1915, Carranza was recognized as the Chief Executive of the Republic of Mexico. President Wilson ordered an embargo on all arms going into Mexico with the exception of those sent to the Constitutionalists. Foreign powers rapidly followed the lead of the American republics in recognizing Carranza. The new leader soon overpowered Zapata and Gutierrez and drove Villa back into his mountain fastness.

Early in 1916, Villa emerged from his retreat and involved the Carranza government in serious difficulties with the United States. On January 11, he seized 19 Americans from a train at Santa Ysabel, Chihuahua, and shot them. Upon the demand of the United States Carranza started a vigorous pursuit of Villa and his followers and succeeded in capturing some of his leaders, but Villa, himself, escaped. On March 9, at the head of 1500 bandits he raided the American town of Columbus, New Mexico, burned and looted it, and killed 15 civilians and 9 troopers. He then made his escape. After some negotiations, with Carranza, in which he did not show a very friendly attitude, a punitive force of American soldiers was sent into Mexico in pursuit of Villa. It was under command of General John J. Pershing. The expedition penetrated more than 300 miles into Mexican territory, but was unsuccessful as far as capturing Villa was concerned. The only serious engagement fought was at Parral where the American forces were attacked by Constitutionalists. While this expedition was seeking Villa he raided the town of Glenn Springs, Arizona. Another punitive expedition chased the bandits more than 150 miles into Mexican territory.

Carranza's attitude throughout these disturbances had been anything but friendly. He continually demanded the withdrawal of the American troops and on May 22, 1916, practically threatened to fire on any American troops in Mexican territory. President Wilson's reply to this was the calling out of the entire National Guard of the country and the strengthening of the forces on the Mexican border. Carranza's hostile attitude left General Pershing's forces in a very precarious position. A new position was taken by his troops much nearer to the border, where he could be easily reinforced by the thousands of militiamen that continued to come to the border. During the last three months of 1916 a joint American-Mexican commission was in session in the United States attempting to settle the difficulties in Mexico as well as to smooth out the international entanglement. Very little was accomplished, largely because the Mexican delegation insisted upon the withdrawal of the American forces and were reluctant to talk about Mexico's internal affairs. Nevertheless, the American troops were gradually withdrawn from Mexico, the last of them leaving in February, 1917.

On Dec. 1, 1916, a constitutional convention convened and drafted a constitution which was promulgated on Feb. 5, 1917. It was very liberal in form, with the exception of the provisions relating to the clergy which were very harsh. The provisions which drew the most attention from abroad, and aroused protests, were those regulating foreign capital. The government was empowered to expel any foreigner whose activities were considered dangerous or embarrassing, and new safeguards were taken against the concession of great oil and mining properties to foreigners, all natural resources being declared public property. Under this provision of the constitution a new tax was levied on oil lands and on oil contracts preceding May 1, 1917. The American government protested against this on the grounds that "the seizure of property at the will of the sovereign without legal process equitably administered,

and without provision for just compensation has always been regarded as a denial of justice."

During October and November, 1919, relations between the United States and Mexico again became very strained. This was due to the seizing and holding for ransom of an American consular agent named Jenkins. The American government demanded his immediate release. The Mexican government at first refused, but after a second note was sent Jenkins was suddenly released and the tension relieved.

The Carranza government came to a sudden end in 1920. In April of that year a revolution broke out in Sonora and soon spread over the entire country. Generals Obregon and Gonzales, two of Carranza's strongest supporters, joined the new movement. Carranza fled from the capital, but was pursued by revolutionists and murdered on May 21. General Obregon was elected as his successor. The question of the recognition of the new ruler was intimately connected with the oil question (mentioned above). On Nov. 17, 1920, the American State Department announced that recognition must be withheld if the Mexican government made the provision of the constitution of 1917 relating to natural resources and the laws enacted under it retroactive. On June 7, 1921, Secretary of State, Hughes, proposed that a treaty of amity and commerce be signed with Mexico whereby Mexico should agree to safeguard property rights that had existed before the constitution of 1917 was adopted. Obregon refused this proposal declaring that the two countries should negotiate on an equal basis. The oil question was partially solved by agreements between the producers and the Mexican government (May 3, 1922), and the situation was considerably relieved by the decision of the Mexican Supreme Court, which said that the famous provision of the constitution of 1917 could not be considered retroactive. The settlement of the oil question seemed to smooth away many of the difficulties between the United States and Mexico and although the Harding administration withheld recognition, the relations between the two countries appeared to grow more cordial.

MEXICO. An inland state of Mexico, bounded by the State of Hidalgo on the north, Tlaxcala, Puebla, and Morelos on the east, Morelos and Guerrero on the south, and Michoacan and Querétaro on the west (Map: Mexico, J 8). A part of this territory, adjacent to the State of Morelos and bounded on three sides by the State of Mexico, is occupied by the federal district,

which is outside the jurisdiction of the state. Area, 9228 square miles. The surface is very diversified. In the north it is generally flat, with a few low hills and a number of lakes. The eastern part is taken up by the Popocatepetl Range with its two great volcanoes rising to an altitude of 17,000 feet. In the south rises the Ajusco Range with its highest peak of over 13,500 feet, while the centre is occupied by the Sierra de las Cruces, exceeding 14,000 feet in its highest peak. The rivers are few in number, the chief among them being the Lerma, which rises in this state. There are a number of lakes in the eastern portion, the largest of which is Lake Texcoco. The climate is generally cold, owing to the mountainous character of the surface. In the valleys, however, it is temperate and healthful and even favorable to the cultivation of tropical fruits. The chief products are cereals, maguey, sugar cane, coffee, tobacco, and rice. The warmer regions produce tropical fruits. Stock raising is also an important and profitable industry. Mining is a growing industry; the chief metals are gold, silver, lead, copper, antimony, and iron. The great El Oro district is one of the leading gold-producing regions of the country. The state is also an important manufacturing centre; its products include cotton and woolen goods, flour, dairy produce, glassware, pottery, bricks, wines, and pulque. The state is traversed by several railway lines, all centring in Mexico City. Pop., 1900, 934,463; 1910, 989,510. The capital is Toluca (q.v.).

MEXICO. The largest and finest city in Latin North America and the capital of the Republic of Mexico. It is situated in the federal district on the west side of the valley of Mexico on the Anahuac plateau, 7350 feet above the sea, in lat. 19° 26' N. and long. 99° 8' W. (Map: Mexico, J 8). Its area is about 15 square miles. The city is 263 miles by rail from Vera Cruz on the Gulf of Mexico, 290 miles from Acapulco on the Pacific, 839 miles from Nuevo Laredo, the nearest railroad town on the United States frontier, and 1224 miles from El Paso, Tex. Its population by the census of 1900 was 368,898, and in 1910, 471,066. It is one of the most ancient cities of the continent and has been successively the capital of the Aztecs, of the Spanish viceroyalty of New Spain, and of the Republic of Mexico. It is the political, financial, and commercial centre of the Republic and is growing in importance as a manufacturing centre.

The valley in which it stands is an immense basin, approximately circular in shape, embracing some 2220 square miles, and completely encircled by high mountains, through which only two or three quite elevated passes afford an entrance. The view of the valley and of its girdling mountains and snow-capped volcanoes from elevations such as the towers of the cathedral or Chapultepec Hill, 3 miles west of the city, is superlatively beautiful. There is no natural exit for the waters which pour down the inner sides of the mountains, and they collect in six lakes scattered over the surface of the plain—Chalco and Xochimilco (fresh water), and Texcoco, Xaltocan, San Cristóbal, and Zumpango (salt water). In an early age nearly the entire surface of the valley was a lake bed, but for many centuries desiccation has been very gradually progressing until the waters are collected entirely in the six shallow basins whose extent

CITY OF MEXICO
THE CATHEDRAL

has been still further reduced by the drainage work recently completed. The waters of Xochimilco, however, were practically absorbed by the network of canals that irrigate the surrounding region.

Owing to the inadequate drainage and sewage systems and a soil permeated with the refuse of centuries, the city long had an annual death rate of 40 to every 1000 inhabitants, a larger proportion of mortality than in any other civilized city of the world. The conditions which promoted this high death rate have largely been remedied, and the city compares favorably with others in salubrity and is decreasing its death rate, though the unhygienic manner of life of the poorer classes swells the mortality. The city is naturally healthful, and in its climatic conditions is a delightful place of residence. The temperature is extremely equable, with an annual range of only 12 to 15 degrees. The mean temperature of the summer months is 60° to 65°, and the mean temperature in midwinter is about 53°. The prevailing winds, coming from the northwest, are damp; while the south winds, which blow only a sixth of the time, are very dry. The total rainfall is about 20 inches, or about half of that at New York.

From its three centuries of Spanish domination Mexico still preserves many characteristics of the great cities of Spain, and from a certain Oriental suggestion in its appearance far surpasses them in novelty and interest. Along with the wonderful commercial development that has characterized the last quarter of a century are to be found evidences of an artistic plan to preserve more beautiful forms of architecture than are usually associated with a modern industrial city, with the result that here may be found an artistic centre for local color not equaled elsewhere on the American continent. Seen from a distance the city, prevailing white in color, is an imposing spectacle. Spreading widely over the plain, overtopped by domes and pinnacles, and hemmed around by majestic mountains, few cities of the world are more charming and impressive.

Most of the houses have terraced roofs and inner courts, are solidly built of sandstone or lava, and are only one to two stories in height, a precaution against the frequent though usually slight earthquakes; but many of the business and public buildings, supported on solid foundations of piling, are three and even more stories in elevation, and some of them reach an altitude of five stories. The walls of many of the poorer buildings are not quite perpendicular, owing to earthquake shocks and the insecure foundation soil of the city, thus giving to some of the street fronts a rather rickety appearance. The later buildings along the business streets are making greater use of steel in their construction, a practice serving to avoid the above difficulties.

Buildings. The cathedral, situated on the north side of the Plaza de la Constitución and built on the site of the great temple of Huitzilopochtli, the titular god of the Aztecs, is one of the largest and most sumptuous churches in America. It was commenced in 1573, dedicated in 1667, and completed in the nineteenth century, at a cost of over \$2,000,000. It is rectangular in form, 426 feet long and 203 feet wide. The interior is in Doric style with traces of Gothic and has a single nave and transept, forming a Latin cross, two aisles, and 13 side

chapels. The massive and tasteless high altar is surrounded by a tombac (copper and zinc alloy) railing which is surmounted by 52 statues. The huge quadrilateral choir is closed in front by a magnificent tombac grill and is connected with the high altar by two railings of the same material. To the rear of the high altar is the chapel of the kings, in Churrigueresque style and the finest in the cathedral. The façade is an attractive example of the architecture of the Spanish Renaissance, blending the Ionic, Doric, and Corinthian orders. Flanking the façade are two open towers, 218 feet high, which were completed in 1791. Facing the plaza on the east side of the cathedral and forming an integral part of it is the Sagrario Metropolitano, one of the parish churches of the city. In addition to the cathedral, Mexico contains some 60 churches, among which the finest are La Profesa, Loreto, Santa Teresa, Santo Domingo, and San Hipólito. A number of Protestant denominations also have houses of worship in the city.

The National Palace, of poor and monotonous architecture, occupies the east side of the plaza. It has a frontage of 675 feet, and with its associated buildings covers an area of 14,000 square meters. It contains the offices of the President, the Senate Chamber, the ministries of Finance and of War, the federal treasury, and the public archives. On its walls are some remarkable paintings by Miranda and other native artists. North of the National Palace and forming a part of it is the National Museum, with its sections of archaeology, natural history, anthropology and ethnography, and Mexican history. It contains priceless collections of Aztec relics, remains of large animals of the Quaternary epoch, and an extensive collection of paintings. The National Observatory and the Meteorological Bureau are also located here. The Monte de Piedad, the famous national pawnshop of Mexico, with nearly 10,000,000 pesos of accumulated funds, stands close to the cathedral, and with its liberal management is really a beneficent charity. Facing the cathedral is the Palacio Municipal, or city hall, containing the city and federal district offices.

In recent years many imposing edifices have been constructed. The Legislative Palace, facing the Plaza de la República, is one of the finest structures of Latin America and was built at a cost of 10,000,000 pesos. The Central Post Office, just back of the National Theatre, is a fine example of the Plateresque style and was completed in 1907 at a cost of 2,921,000 pesos. The National Penitentiary, at the eastern edge of the city, is a large and perfectly equipped institution, which was opened in 1900. Other notable buildings, all of them old and of historic interest, are the School of Medicine on the Plaza Santo Domingo, occupying the quarters in which the Inquisition made its infamous history; the church of the Jesuits; the School of Arts, where many branches of industry are taught; the National Picture Gallery of San Carlos, in which the Florentine and Flemish schools are especially well represented; the National Library, formerly the church of San Agustín, with over 200,000 volumes, numerous manuscripts, and rare old Spanish books; the Mint, in which silver and gold have been coined since 1690, to the value of nearly \$3,000,000,000; the Itúrbide Hotel; and the School of Mines, designed by the artist Tolsa, one of the finest

structures in Mexico, with rich mineralogical and geological collections and containing also the School of Engineering with its observatory. There are 19 hospitals; many of them dating from colonial times and occupying old buildings; the General Hospital and the Insane Asylum, however, are of the most modern type.

One of the curiosities of the city is the little old building in which the first printing in America was done. There are over 200 periodical publications registered in the capital, including about a score of dailies. They administer to every phase of the intellectual and artistic life, a number being printed in English, German, and French. The Geographical and Statistical Society, which issues many maps and charts, is the principal scientific institution of the country. The educational system of the city comprises the university, with its various faculties; technical and professional schools, including two normal schools, an engineering school, a school of fine arts, a conservatory of music, and a school of commerce; numerous public schools of primary and secondary grade; and many private institutions.

Streets and Parks. Mexico is said to be the finest-built city on the American continent. Some of its thoroughfares, paved with asphalt and lined with houses whose height bears a strict architectural relation to the width of the streets, certainly bear out this assertion. Its 2500 streets and lanes are laid out with great regularity, running generally from north to south and from east to west, except in some of the newer sections, and intersecting at right angles. The monotony of this arrangement is broken by an occasional public square or garden, while in the suburbs there are numerous diagonal streets and avenues. Many of the streets are very narrow, especially in the older portion of the city lying within the line of the old walls. Even where the streets are wider the sidewalks are usually too narrow to accommodate the passers-by. Formerly the system of street names was a bewildering puzzle, the same street changing its name many times. This condition has been remedied somewhat by the readjustment of the nomenclature made in 1908 and 1909. Starting from the Plaza de la Constitución, the electric tramway system reaches all parts of the city and the suburbs. The principal streets are electrically lighted and are clean and well kept.

San Francisco Avenue, the leading business thoroughfare, connects the Plaza Mayor with the Alameda and reminds the visitor strongly of the fashionable shopping districts of European centres. Here shops, with their costly displays of all sorts of merchandise, the best hotels, cafés, and restaurants, the business offices and clubs, pour forth during the later afternoon hours their elegantly attired throngs that overflow the narrow sidewalks and fill the costly equipages and hackney coaches moving in a double line along the crowded street. San Francisco Avenue is interesting any day, but it is doubly so when processions of flower-bedecked carriages, columns of troops in showy uniform, and the gayly decorated fronts of the buildings proclaim the celebration of the fiestas of September or of the Cinco de Mayo (Fifth of May). The avenue Cinco de Mayo, a rival of San Francisco Avenue and running parallel to it, extends from the cathedral to the new National Theatre. The Paseo de la Reforma is the finest avenue and

drive in the Republic and is the highway of Mexican social life. It was constructed by the order of Emperor Maximilian and extends a distance of 2 miles from the Alameda to the hill of Chapultepec. It has a double avenue of fine trees, shading well-constructed stone sidewalks, which are lined with beautiful residences. There are six glorietas (circular parked expansions), each 400 feet in diameter, every one exhibiting a wealth of flowers and shrubbery and some surmounted with fine monuments of historic interest. Its terminal parks are of rare beauty and are in the midst of an architectural setting that each year becomes more imposing. It is no wonder that every afternoon from five to seven o'clock the paseo is the favorite parade ground for every Mexican who owns or can afford to hire an equipage. Along the line of handsome vehicles one occasionally detects a touch of domestic color in the person of some caballero in native costume, but such appear with less frequency as the years pass on, and the Mexican Vanity Fair approximates more closely to the ordinary park processions of the great world centres.

A spot hardly second to the paseo in interest is the beautiful park and promenade known as the Alameda. With its 40 acres well shaded with poplar and beech trees and variegated with a most profuse collection of semitropical plants and shrubs, it has long been the favorite stamping ground of Mexican aristocracy, whose weekly parade on Sunday from eleven to one exhibits the fashionable life of the capital at its best. Here a fountain now stands on the site of the Quemadero, or burning place of the Inquisition, where many a heretic expiated his heresy at the behest of the then all-powerful church and had his ashes thrown into the ditch flowing behind the neighboring sanctuary of San Diego. The central Plaza de la Constitución, or Plaza de Armas, or Plaza Mayor, surrounded by the magnificent cathedral, the National Palace, the municipal buildings, and some of the finest retail stores, seems more truly than any other spot the real centre of the city. It covers 14 acres and is beautified by trees, flower plots, statuary, and marble fountains, while in the centre is the charming band stand which gives to it its popular name of Zócalo. Formerly the centre of the commercial life of the metropolis and still that of the political life, it is the scene of the patriotic celebrations so dear to the heart of its populace. It is here, during the fiestas of September, that one can view the floral parade of the fourteenth; can listen to the charming military concerts of the fifteenth and behold the gorgeous electric and pyrotechnic display that follows the commemorative ring of the grito of Hidalgo; and on the sixteenth can see the parade of column after column of Mexico's well-drilled troops.

Monuments. The city, which contained the first academy of fine arts erected upon the American continent, still affords many examples of the artistic instinct of its people in its well-built public and private residences and in important groups of statuary. Among the most important of these is the equestrian statue of Carlos IV, begun in 1794 and finished in 1803, the work of a native artist, Manuel Tolsa. Originally placed on the Plaza Mayor, it is now situated at the city terminus of the paseo. In the first glorietta of the paseo is the monument to Christopher Columbus; in the second, that to

Cuauhtemoc, the last of the Aztec rulers, one of the most impressive structures on the American continent; and in the fourth, the monument to the national independence, an imposing structure combining modern and classic styles and completed in 1910. The striking Benito Juárez Monument, facing Juárez Avenue midway along the Alameda, was constructed in commemoration of the hundredth anniversary of the independence. The tomb of Juárez in the pantheon of San Fernando is a noteworthy piece of Mexican art.

Clubs and Theatres. As may be imagined, the social life of Mexico City, from a Latin-American point of view, is exceedingly attractive. In addition to many native organizations, all of the principal foreign colonies have a social centre, the British and the Americans being especially well housed. The Jockey Club, a native organization, has as its headquarters one of the finest buildings in the city, formerly the palace of the Count del Valle. The new National Theatre, a government undertaking, located at the eastern end of the Alameda, is the largest and finest theatre in the Republic. Among the other playhouses are the old Teatro Nacional, the Teatro Colón, the Teatro Arbu, and others of lesser note. In no other country except Spain is bullfighting so popular, and although the administration of Díaz made quiet efforts to bring the sport into disrepute, the two bull rings are well thronged on festal days and at the Sunday performances.

Suburbs, etc. Extension of the tramway system resulted in a great expansion of the older city and a development of the suburban towns. One of the earliest additions to the old city was the Colonia Juárez, which was laid out in 1890 and lies just south of the Paseo de la Reforma. Here American ideas of architecture and hygiene were developed and have exerted a great influence upon the city. This handsome colonia is the centre of the American, English, French, and German wealth and fashion of the metropolis. To the south of the Colonia Juárez are the colonias Roma, Condesa, and Hidalgo, and to the north are the colonias Cuauhtemoc, San Rafael, and Santa María, all patterned after the original colonia and forming the chief residential sections of the city. Just to the west of the Colonia Juárez and at the far end of the paseo is Chapultepec, a mass of rock rising some 200 feet from the midst of magnificent cypress groves and topped by the splendid structure containing the National Military Academy and the President's summer palace, from which may be obtained the finest view of the valley. The older suburban towns, while not so desirable as places of residence, are full of historic interest. To the southwest of the city is Tacubaya, the most fashionable resort of Mexico, situated in the most fertile portion of the federal district. Here is located one of the national observatories, occupying a former palace of the Archbishop of Mexico. To the north of the city lies Guadalupe Hidalgo, whose beautiful and rich church is the Lourdes of Mexico and whose traditional Virgin has become the tutelary divinity of the modern Republic. To the south is the Viga Canal, lined with the so-called floating gardens, the region which furnishes the flowers, fruits, and vegetables for the city markets and whose inhabitants present some of the most interesting pictures of contemporary native life. Upon this canal are the towns of Santa Anita and Iztacalco, inter-

esting pleasure resorts frequented by the lower classes. Also to the south is Tlalpam, a resort second only to Tacubaya in importance. To the west, Popolota contains the Noche Triste tree, under which tradition says that Cortés wept on the night of his expulsion from Mexico. By rail it is possible to extend one's excursions beyond the mountain valley to the most interesting points of ancient and modern Mexican history, all of which are within easy distance of the capital.

Industries and Commerce. The high price of fuel long hampered the industrial development of the city. The use of electric power, however, has produced a great increase in the industries. In 1914 there were 153 manufacturing establishments in the city, producing cotton, linen, and silk textiles, leather, boots and shoes, alcohol, beer, flour, cigars and cigarettes, chocolate, hats, ice, furniture, pianos, matches, glass, soap, bricks, carriages, etc. The textile and cigarette enterprises are the most important. In the suburban towns also there are numerous factories. A large part of the trade interests is in the hands of French, German, and English merchants. (For communications with the United States and other countries, see MEXICO.) The city is the wholesale centre for the nation, and its banks, of which the most important are the National Bank of Mexico, capitalized at 32,000,000 pesos, the Mexican Central Bank, capitalized at 30,000,000, and the Bank of London and Mexico, capitalized at 21,500,000, control its financial conditions. Its 15 markets are large and well ordered and a perpetual convenience to its inhabitants.

Drainage and Water Supply. The city derives its water supply from the western mountains, the greater portion coming from the vicinity of Tacubaya. For the transportation of the water there has been constructed a series of aqueducts, the first of which was completed in 1576 and the last was opened in 1910. Upon the inauguration of the new system, in this latter year, there was available an average of 400 liters per day for each inhabitant of a population of 545,000. New plans were made to secure a more even distribution of the water supply, especially in the poorer sections, where the lack of water had contributed greatly to the unsanitary conditions.

The drainage works, which have vastly improved the sanitary conditions, were completed in 1900 after three centuries of more or less spasmodic effort and at the cost of the lives of many thousands of men and many millions of dollars. The great evils from which the city of Mexico suffered for many generations were inundations from Lake Texcoco and disease promoted by the fact that the city stood in the bottom of an undrained natural sink. The lake, suddenly filled by downpours from the mountains, sometimes buried the streets in water for weeks. Thirty thousand persons were drowned by the sudden submergence of the city in 1629, and similar catastrophes were caused by other floods. It was to rescue the city from inundations that the drainage works were begun three centuries ago, but it was not till 1789 that the city ceased to be menaced by deluges. Up to 1830 the total expenditure on the drainage works had been \$8,000,000, but the menace of malaria and epidemics had not yet been removed. The canal was not deep enough, the lake was still very little below the mean level of the city,

and the fall was not sufficient to carry off the sewage. The gigantic works, which were not seriously undertaken till 1885 and completed in 1900, now rank among the great engineering achievements of modern times. The works consist of sewers carrying the waste of the city to a canal starting from the San Lázaro gates and extending for 43 miles, its course being deflected so as to cut Lakes San Cristóbal, Xaltocan, and Zumpango. Near the town of Zumpango the canal empties into the tunnel, completely lined with brick, which has been dug through the mountains a distance of 32,869 feet to a river which carries the sewage to the Gulf of Mexico. These works thus carry all the surplus waters and sewage of the city of Mexico outside of the valley, and also control the entire waters of the valley, affording an outlet to those that might otherwise overflow fields and towns.

Government. With the exception of the temporary organization of a municipal government at Vera Cruz to further the ambitious plans of Cortés, the municipal corporation of Mexico City was the first to be established upon the American continent. The probable date of its establishment by the Great Conqueror is 1522, but the earliest preserved record of its meetings is that of March 8, 1524. In that year the officers consisted of two *alcaldes* (municipal judges), four *regidores* (members of the council), a *procurador* (attorney), and a notary. Later the number of *regidores* was increased to six. The first council was appointed by Cortés. Afterward the *regidores* were appointed annually by the Governor and royal officials upon nomination by the people, and the *alcaldes* were chosen by the *regidores*. Later there were 15 perpetual and hereditary *regidores*, who were either appointed by the crown or purchased their office. They were empowered to name two *alcaldes* every year and six *regidores* and an attorney every two years. By this arrangement the city council became a closed corporation. It offered, however, the only official positions which were open to the creoles. Its powers were never clearly defined, but in general it busied itself with the local government, including the police power and administration of justice.

Although created at first as the creature of Cortés, the *cabildo* (municipal corporation) of Mexico soon became a powerful body, strong enough in some cases to make or mar the reputation of succeeding viceroys. It greatly interfered with the salutary reforms of the Count of Revilla Gígedo (1789-93), and on the abdication of Ferdinand VII in 1808 it took a prominent part in the assembling of a general junta of New Spain to resist the pretensions of Joseph Bonaparte.

Following the declaration of Mexican independence and the division of New Spain into the states of the Republic of Mexico, there arose a conflict between the state authorities of Mexico and the national government which resulted in the creation, Nov. 18, 1824, of a federal district, comprising the territory within a radius of two leagues of the main plaza. The federal district was subsequently enlarged, until it comprises 12 municipalities besides that of Mexico, which of itself covers 15 square miles. The city now has an *Ayuntamiento Constitucional* (Constitutional City Council), consisting of 21 members, elected by a popular vote. It chooses its own president and vice president. The *Ayuntamiento* is quite overshadowed by the

Superior Council of the federal district, which consists of the Governor of the district, the Director General of Public Works, and the president of the Superior Board of Health. This council, which is responsible directly to the president, controls much of the local administration. It must, however, consult the *Ayuntamiento* in all matters of a general importance to the municipality, such as the water supply, sanitation, and contracts. The *Ayuntamiento* holds a limited veto power in respect to contracts affecting the city. The income of the municipality is derived from taxes on the water supply, commercial establishments, public amusements, slaughter houses, vehicles, and pulque. The revenues of the city have increased greatly, in 1911-12 amounting to 4,461,461 pesos, of which 1,030,920 was from the pulque tax.

History. The city dates from about 1325 A.D., when the Aztecs, looking for a favorable site, saw perched on a cactus an eagle devouring a snake. The omen was interpreted to mean that this was to be the site of their city; hence its original name, Tenochtitlan (cactus on a stone), changed later to Mexico in honor of the war god Mexitli. With the progress of Aztec culture the city expanded and improved, and about 1450 tradition reports that the mud and rush houses were replaced by solid stone edifices built partly on piles amid the little islands of Lake Texcoco. The Aztec city was an imposing spectacle at the time of the arrival of the Spaniards in 1519, when it is reported to have contained at least 50,000 buildings and several hundred thousand inhabitants. It was about 10 miles in circumference, everywhere intersected by canals and connected with the mainland by six long and solidly constructed causeways. It was thus essentially a lacustrine city, but the subsidence of Lake Texcoco has left the modern city high and dry, with the lake $2\frac{1}{2}$ miles away. The Aztec city was almost wholly destroyed by Cortés, who in 1521 employed the friendly natives to rebuild the city on the same site. Under Spanish domination the city in 1600 contained about 15,000 inhabitants, which number gradually increased to 120,000 two centuries later.

The city is full of historic interest and has been the scene of many events of national importance. It was captured by the United States after the battle of Chapultepec, on Sept. 13, 1847, and by the French forces under Marshal Forey in 1863. Upon the downfall of Emperor Maximilian, Juárez entered the city (July 15, 1867), and on Nov. 23, 1876, Díaz was here proclaimed provisional President and began his long régime. In February, 1913, 10 days of sanguinary street fighting and bombardment of public buildings took place during the struggle between the Madero government and the Revolutionists under Felix Díaz and Gen. Bernardo Reyes. It was occupied by the Constitutionalists in August, 1914, and subsequently was alternatively in the hands of Carranza, Zapata, and Villa. It suffered greatly from the chaotic conditions existing in 1915. In spite of its misfortunes it is a leading centre of intellectual and industrial development of Latin America, and is at once one of the most interesting and most promising cities of the western continent.

MEXICO. A town of Luzon, Philippines, in the Province of Pampanga (Map: Luzon, D 6). It is situated on an arm of the Pampanga Delta, 5 miles northeast of Bacolor. Pop., 1903, 13,469.

MEXICO. A city and the county seat of Audrain Co., Mo., 110 miles by rail northwest of St. Louis, on the Wabash, the Chicago and Alton, and the Chicago, Burlington, and Quincy railroads (Map: Missouri, E 2). It is the seat of Hardin College for Women (Baptist), founded in 1873, and of the Missouri Military Academy; and contains a Carnegie library and fine high school and post office buildings. There is a considerable trade in horses and cattle, and the industrial establishments include flour mills, shoe and ice factories, fire-brick, marble, stove-lining, and cigar works. The surrounding region abounds in clay of an excellent grade. Settled in 1833, Mexico was incorporated in 1852. The government is administered under a charter of 1893, which provides for a mayor, elected biennially, and a unicameral council. Pop., 1900, 5099; 1910, 5939.

MEXICO, GULF OF. A partially inclosed basin of the Atlantic Ocean, having the United States on the north and Mexico on the west and south. It has an extreme length from east to west of about 1100 miles and a breadth from north to south of 800 miles; its area is estimated at 700,000 square miles (Map: America, North, J, K, 7). The opening of the gulf eastward is narrowed by the peninsulas of Florida and Yucatan, which approach within 450 miles of each other. Near the middle of the outlet lies the island of Cuba, forming two passages—the Strait of Florida, 125 miles wide, between Florida and Cuba, and the Yucatan Channel, 120 miles wide, between Cuba and Yucatan. The north entrance connects with the Atlantic Ocean and the south with the Caribbean Sea. The basin of the gulf attains a maximum depth of 12,700 feet, while a large proportion of its area exceeds 10,000 feet in depth. From Florida west to the Mexican boundary the shores form a part of the coastal plain and slope so gradually that the 100-fathom line is distant 100 miles or more from land. Off the Mexican coast, however, the basin rapidly sinks to the level of the submarine plain known as Sigsbee's Deep, which has an average depth of 12,000 feet. The passages leading to the Caribbean Sea and the Atlantic are relatively shallow. The gulf contains few islands and these are located in proximity to the coasts; the Florida Keys, the delta of the Mississippi, and the islands on the coast of Yucatan are the most important. Numerous small bays and innumerable lagoons inclosed behind sand bars give relief to the coast line, which is otherwise quite regular. The Bay of Campeachy, between Yucatan and the main mass of Mexico, is the only broad indentation. Owing to the low shores, good harbors are not numerous, the best being those of Vera Cruz, Galveston, Mobile, Tampa, Pensacola, and Havana. The principal rivers flowing into the gulf

descend from the United States, and include the Mississippi, Rio Grande, Colorado of Texas, Brazos, Sabine, Mobile, and Apalachicola. The prevailing winds from March to September are the northeast trades, while during the colder portion of the year, owing to the relatively high temperature of the gulf, there is a cyclonic inflow of air, associated with strong northerly winds, which sometimes move with terrific force, causing violent gales. The tides in the gulf rarely exceed 4 feet for the spring tides, and 2½ feet for the neap tides. The most remarkable feature in connection with the Gulf of Mexico is the Gulf Stream (q.v.), which enters it by the south channel, passes round it, and emerges through the Strait of Florida. The swiftest portion of the stream, as it issues from the gulf, has a velocity of more than 4 miles per hour. Owing partly to the presence of this heated current, the temperature of the gulf is eight or nine degrees higher than that of the Atlantic in the same latitude.

MEYER, mi'ér, ADOLF (1866—). An American pathologist and alienist, born at Niederwenigen, near Zurich, Switzerland. Having studied medicine at Paris, London, Edinburgh, Vienna, Berlin, and Zurich (M.D., 1892), he came to the United States; lectured on neurology at the University of Chicago (1892-95); and served as pathologist to the Illinois Eastern Hospital for the Insane at Kankakee, Ill. (1893-95). While pathologist and later director of the clinical and laboratory work of the Worcester (Mass.) Insane Hospital, he lectured on psychiatry at Clark University (1895-1902). From 1902 to 1910 he served as director of the Pathological Institute of New York State Hospitals and in 1904-09 also as professor of psychiatry at Cornell University Medical College; and in 1910 he was appointed to the corresponding chair at Johns Hopkins University and director of the Henry Phipps Psychiatric Clinic of Johns Hopkins Hospital. He was president of the New York Psychiatric Society and of the American Psychopathological Association. Besides contributing to the NEW INTERNATIONAL ENCYCLOPÆDIA, he published *Dementia Præcox*, with others (1911).

MEYER, ADOLF BERNHARD (1840-1911). A German zoölogist and anthropologist, born in Hamburg. After a prolonged course of study in medicine and natural history at the universities of Göttingen, Vienna, Zurich, and Berlin, he explored the Malay and Philippine Islands, and in 1874 became director of the Dresden Royal Museum of Natural History, retiring in 1905. Among his writings are *Abbildungen von Vogelskeletten* (1879-95); *Publikationen des königlichenethnographischen Museums zu Dresden* (1881-1903); *Album von Philippinentypen* (1885-1904); *The Birds of Celebes* (1898); *The Distribution of Negritos* (1899); *Studies of the Museum* (of Natural History) and *kindred Institutions of New York, etc.* (1905); *Amerikanische Bibliotheken und ihre Bestrebungen* (1906); *Römerstadt Agunt* (1908).

MEYER, ANNIE NATHAN (1867—). An American author and promoter of the higher education of women, a sister of Maud Nathan. She was born in New York City and in 1887 was married to Dr. Alfred Meyer. She was instrumental in founding Barnard College, New York, now a part of Columbia University, and became known also as an opponent of woman suffrage. At one time she was associate editor

of the *Broadway Magazine*. Besides editing *Woman's Work in America* (1891) and contributing a series of articles on "Higher Education for Women" to the *New York Evening Post*, Mrs. Meyer published *Helen Brent, M.D.* (1892); *My Park Book* (1898); *Robert Annys: A Poor Priest* (1901); *The Dominant Sex* (1911); *The Dreamer* (1912).

MEYER, BALTHASAR HENRY (1866-). An American railway expert, born at Mequon, Ozaukee Co., Wis. He graduated from the Oshkosh Normal School in 1893; studied at the University of Berlin in 1894-95; and finished his education at the University of Wisconsin (B.L., 1894; Ph.D., 1897), where he was instructor in sociology (1897-99), assistant professor of sociology (1899-1900), and professor of political economy (1900-10). He served as member (1905-11) and chairman (1907-11) of the Railroad Commission of Wisconsin; was a member of the United States Railroad Securities Commission in 1910; and was appointed by President Taft a member of the Interstate Commerce Commission in January, 1911. He had charge of the valuation of railroads in the United States in 1904-05. He is author of *Railway Legislation in the United States* (1903); *A History of the Northern Securities Case* (1906).

MEYER, CHRISTIAN ERICH HERMANN VON (1801-69). A German paleontologist, born at Frankfort-on-the-Main. He was educated at Heidelberg and at Munich and from 1837 to 1866 was connected with the financial administration of the government. He received the Wollaston medal from the Geological Society of London in 1858. The published results of Meyer's paleontological researches include: *Paläologica zur Geschichte der Erde und ihrer Geschöpfe* (1832); *Die fossilen Zähne und Knochen und ihre Ablagerung in der Gegend von Georgsmünd* (1834); *Neue Gattungen fossiler Krebse* (1840); his most important work, *Zur Fauna der Vorwelt* (4 vols., 1845-60); *Die Reptilien und Säugthiere der verschiedenen Zeiten der Erde* (1852).

MEYER, CLAUD (1856-). A German genre painter, born at Linden, near Hanover. He studied first at the School of Arts in Nuremberg, then at the Munich Academy, chiefly under Lüftz, whose influence led him to an intimate study of the Dutch masters of the seventeenth century. He acquired such delicate nuances of color and subtle characterization as almost to equal his models. His best-known works are Flemish or Dutch interiors with quiet contemplative figures or merry groups, painted with exquisite detail and fine naturalism. Such are "The Dice Players" (Berlin Gallery); "Merry Company" (Düsseldorf); "Dutch Interior" (1882); "Sewing Room in a Béguine Convent" (1883, Munich Gallery), awarded the great gold medal at the International Exhibition in Munich. "Old and Young Cats" (1885, Dresden Gallery) and "Infants' School" (1888, Karlsruhe Gallery) are also notable. Meyer was professor at the School of Art in Karlsruhe in 1891-95, and afterward at the academy in Düsseldorf. His later works include religious pictures, such as "Christ Among the Doctors" (Barmen Gallery) and "Fear Not"; also some notable mural decorations in the city hall at Duisburg and in Castle Burg on the Wupper. Consult Board, in *Kunst für Alle* (Munich, 1907), and Schippang, in *Kunst unserer Zeit* (ib., 1909).

MEYER, EDUARD (1855-). A German

historian, born at Hamburg and educated at the universities of Bonn and Leipzig. He was appointed professor at Breslau in 1885, at Halle in 1889, and at Berlin in 1902. He lectured at Harvard in 1909. Honorary degrees were given him by Oxford, St. Andrews, Freiburg, and Chicago universities. His principal work is his *Geschichte des Altertums* (1884-1902; 3d ed., 1913). He also published: *Forschungen zur alten Geschichte* (1892-99); *Untersuchungen zur Geschichte der Gracchen* (1894); *Wirtschaftliche Entwicklung des Altertums* (1895); *Die Entstehung des Judentums* (1896); *Zur Theorie und Methodik der Geschichte* (1902); *Die Israeliten und ihre Nachbarstämme* (1906); *Der Papyrusfund in Elephantine* (1912).

MEYER, GEORGE VON LEMBERGE (1858-1918). An American political leader, diplomatist, and cabinet officer, born in Boston. He graduated at Harvard in 1879 and from then until 1899 maintained active mercantile and banking interests. He served as common councilman and alderman of Boston and as a member of the Massachusetts House of Representatives (1892-97), being Speaker during the last three years. In 1900-05 he was Ambassador to Italy and then for two years Ambassador to Russia. In 1907 he became Postmaster-General, under President Roosevelt, and during President Taft's administration he was Secretary of the Navy. He served on the Republican National Committee from 1898 to 1904.

MEYER, HANS (1846-). A German engraver, etcher, and painter. He was born in Berlin and studied under Mandel and at the Berlin Academy, and later traveled in Italy, Holland, Belgium, and France. He became a professor at the Academy for Fine Arts in Berlin, and received many honors, including medals at Munich in 1891, Chicago in 1893, Antwerp in 1894, and the great gold medal at Berlin in 1899. Among his best plates are "Poetry" after Raphael; "Mary and Elizabeth" after Moretto; "The Lady with the Glove" after Van Dyke; "Peace and War" after Geselschap's mural paintings in the Berlin Hall of Fame; and a series of fantastic original etchings, the "Dance of Death." He also painted landscapes in water color and tempera.

MEYER, HANS (1858-). A German explorer and publisher. He was born at Hildburghausen and studied science and political economy at Leipzig, Berlin, and Strassburg. He traveled in Asia, North America, and South Africa (1883) and in 1887 explored Kilimanjaro in East Africa. After several venturesome attempts to ascend the mountain he reached the top of the higher of the two peaks, the Kilbo summit (1889), where he found a crater more than a mile wide and about 19,700 feet above the sea. In 1898 he made an exhaustive study of the mountain and its glaciers and wrote *Der Kilimandjaro* (1900). In 1884 he entered the Bibliographisches Institut (Leipzig), founded by his grandfather, Joseph Meyer (1796-1856). Upon the retirement in 1885 of his father, Hermann Julius (1826-1909), Hans Meyer and Arndt Meyer became directors of the well-known publishing house. In 1903 Herman Meyer joined the firm. In 1903 Hans studied the glaciation of the Ecuadorian Cordilleras. In his *Zum Schneedom des Kilimandscharo* (1888) he gives a full account of his experiences and discoveries in that region. In 1908 he made another trip to East Africa. Among his other

writings are *Eine Weltreise* (1884); *Ostafrikanische Gletscherfahrten* (1890); *Die Eisenbahnen im tropischen Africa* (1902); *In den Hoch Anden von Ecuador* (1907); *Das deutsche Kolonialreich* (1909, 1910), with others.

MEYER, HEINRICH (1760-1832). A Swiss writer on art and antiquity. He was born at Zurich and studied painting there under Füessli. In 1784 he went to Italy and at Rome in 1788 he met Goethe, with whom he contracted a friendship so intimate that he was known in Germany by the name of "Goethe-Meyer." In 1792, through the influence of Goethe, he was appointed a professor in the Weimar Academy of Design. Three years later he revisited Italy, and in 1797 returned to Weimar, where he was made a director of the academy in 1807. Many of the critical portions of Goethe's essays on art in *Kunst und Altertum* are to be credited to Meyer, and he also assisted Goethe in his *Propyläen*. As a painter, his production was scanty. He edited, with extensive annotations of his own, the works of Winckelmann (1808-20). These notes he subsequently expanded into a general history of Greek art, which appeared under the name of *Geschichte der bildenden Künste bei den Griechen und Römern* (with an additional volume by Riemer, 1824-36). He died at Weimar, leaving to that city a bequest of 33,000 thalers for the establishment of a foundation for the poor.

MEYER, HEINRICH AUGUST WILHELM (1800-73). A German Bible commentator. He was born at Gotha, studied theology at Jena, and held various pastoral charges. After 1841 he resided in Hanover as a member of the consistory. His fame rests upon his *Kritisch-exegetisches Kommentar zum neuen Testament*, in some respects the greatest modern biblical commentary, of which the first volume, containing the first three Gospels, appeared in 1832. It was completed in 1859, though some of the later volumes were done by others. An English translation appeared at Edinburgh, with the exception of the *Revelation* (20 vols., 1873-82), and an American in New York (11 vols., 1884-88). More recently German revisions by later scholars have been published.

MEYER, HENRY HERMAN (1874-). An American Methodist Episcopal clergyman and editor, born at Champaign, Ill. He attended the California State Normal School; graduated from German Wallace College (Ohio) in 1900 and from Drew Theological Seminary in 1903; and later was a graduate student at Columbia University and at Jena. For several years before being ordained in 1900 he had held various pastorates; he was then for a year a professor in St. Paul's College (Minnesota). In 1903 he became assistant editor of the Sunday-school publications of the Methodist Episcopal church, and after the death of the editor in chief, J. T. Macfarland, he was elected to succeed him (1914). In 1911 he served as secretary of the Sunday School Council of the United States and Canada, and he became a member of the executive council of the Religious Education Association. He edited the *Lesson Handbook* after 1904, and is author of *Stencil Maps and Missionary Chalk Talks* (1904) and *The Graded Sunday School in Principle and Practice* (1910).

MEYER, HUGO RICHARD (1866-). An American economist. He was born in Cincinnati, Ohio, and was educated at Harvard University (A.B., 1892; A.M., 1894), where he was an in-

structor in political economy from 1897 to 1903. He served as assistant professor of political economy at the University of Chicago in 1904-05 and after 1907 spent considerable time in travel. He is author of *Government Regulation of Railway Rates* (1905); *Municipal Ownership in Great Britain* (1906); *The British State Telegraphs* (1907); *Public Ownership and the Telephone in Great Britain* (1907).

MEYER, JOHANN GEORG (MEYER VON BREMEN) (1813-86). A German genre painter, born at Bremen. He was a pupil at Düsseldorf of Sohn and Schadow and at first painted biblical subjects, but after 1842 practiced genre painting. His favorite subjects were peasants of the Hessian, Bavarian, and Swiss mountain districts. Among his early works were "The Anniversary of the Hessian Parson" (1842) and "The Penitent Daughter" (1852), Bremen Gallery. His scenes from child life followed after he settled in Berlin in 1852. These include: "Girl Telling Fairy Tales," "Blindman's Buff," "The Youngest Brother," and the "Little Mother" (1852), National Gallery, Berlin. He also painted single or group figures of young girls, like his "Awaiting," "The Courting," and "Reading the Love Letter." The Metropolitan Museum of New York possesses "The Letter" (1873). Meyer's pictures are often naïve and full of humor, but lack sound pictorial qualities, and are illustrations rather than paintings. He was a professor at the Berlin Academy and received a medal in Philadelphia in 1876.

MEYER, JÜRGEN BONA (1829-97). A German philosophical writer and follower of Kant. He was born at Hamburg and studied science and philosophy in Berlin and Bonn. In 1862 he was admitted as privatdozent to the philosophical faculty at Berlin University and in 1868 he became professor of philosophy at Bonn. From 1889 to 1892 he was editor of the *Deutsche Zeit- und Streitfragen*, and from 1893 to 1896 of the *Vereinsblatt des liberalen Schulvereins Rheinlands und Westfalens*, both social-political journals. In these most of his later essays appeared. He published: *Aristoteles Thierkunde* (1855); *Voltaire und Rousseau in ihrer socialen Bedeutung* (1856); *Zum Streit über Leib und Seele* (1856); *Grundzüge der Schulreform unserer Zeit* (1861); *Religionsbekenntniss und Schule* (1861); *Kants Psychologie* (1869); *Philosophische Zeitfragen* (1870; 2d ed., 1874); *Leitfaden zur Geschichte der Philosophie* (1882); *Probleme der Lebensweisheit* (1887).

MEYER, KONRAD FERDINAND (1825-98). A Swiss poet and historical novelist. He was born in Zurich, the son of the historian and official F. Meyer, spent a part of his youth in the French cantons, where he learned the language. He studied law in Zurich and then devoted some years to the private study of history. After visiting Paris in 1857 and Rome in 1858, he settled permanently in Kilchberg, near Zurich. The little volume of 20 historical *Balladen* (Leipzig, 1864), by which he first attracted attention, is halting in expression, as are the verses of *Romanzen und Bilder* (Leipzig, 1870). More plasticity appears in *Huttens letzte Tage* (Leipzig, 1871; 50th ed., 1911) and in *Engelberg* (ib., 1873), both narrative poems of power. Meyer then turned his attention from verse to prose, still remaining faithful to historical themes, and produced six striking epic narratives, which, though they require in the reader too wide a culture to be popular, are an endur-

ing part of German novelistic literature. These are: *Jürg Jenatsch* (1876; 117th ed., 1912); *Der Heilige* (1880; 63d ed., 1912); *Leiden eines Knaben* (1883); *Die Hochzeit des Mönchs* (1884); *Die Versuchung des Pescara* (1887; 43d ed., 1912); *Angela Borgia* (1891). Meantime he had written a remarkable group of historical short stories, first collected as *Kleine Novellen* (1883) and later as *Novellen* (50th ed., 1912). Characteristic and perhaps best of these is *Gustav Adolfs Page*. His early poems are incorporated, with many changes, almost always for the better, in *Gedichte* (1882; 59th ed., 1912). Meyer's literary characteristics, which combine to make him the most important imaginative writer in Switzerland in his generation, are truthfulness of observation, a realistic plasticity in description, clearness of style, objectivity in statement. A uniform edition of Meyer's works appeared in 1892; his collected works in eight volumes (Leipzig, 1912). For his biography, consult Trog (Basel, 1897) and Frey (Stuttgart, 1900; 2d ed., 1909); also Moser, *Wandlungen der Gedichte K. F. Meyers* (Leipzig, 1900); Kraeger, *K. F. Meyer, Quellen und Wandlungen seiner Gedichte* (Berlin, 1901); A. Stern, *Studien zur Litteratur der Gegenwart*, vol. ii (Dresden, 1904); H. Stichelberger, *Die Kunstmittel in Meyers Novellen* (Burgdorf, 1907); M. L. Taylor, *A Study of the Technique of C. F. Meyer's Novellen* (Chicago, 1909); E. Korrodi, *Conrad F. Meyer* (Leipzig, 1911).

MEYER, KUNO (1858-1919). A German scholar, distinguished in the field of Celtic literature, born at Hamburg and educated in the schools of that city and at the University of Leipzig. At first devoting himself to Germanic and Celtic philology, he eventually made Celtic philology the centre of his studies. An appointment (1884) as lecturer in Teutonic languages at University College, Liverpool, was followed by an appointment as professor in the same institution 10 years later, and in 1911 he accepted the chair of Celtic at Berlin. He founded the *Zeitschrift für celtische Philologie* in 1895, and, with Whitley Stokes, the *Archiv für celtische Lexicographie* three years later. In 1903, with John Strachan, he founded the Summer School of Irish Learning, Dublin, the purpose of which was the promotion of the study of the old Irish language and literature. His scholarly enthusiasm was an inspiration to the leaders of the Gaelic League, which sought to make Irish the spoken language of Ireland, and a help to the translators and poets of the Irish literary revival of the 1890's. His contributions to Celtic scholarship have been important and original. The Irish recognized his services to them by making him an honorary freeman and Burgess of the cities of Dublin and Cork, but Dublin withdrew the freedom of the city in 1915 because of several pro-German war-time addresses made by Meyer in the United States. An invitation to lecture at Harvard in the same year he first accepted and later declined, incensed at what he considered the unneutral attitude of the university. Honorary degrees (D.Litt.) came to him from the University of Wales, from Oxford, and from St. Andrews. Among his publications are: *The Irish Odyssey* (1885); *The Vision of MacConglinne* (1892); *The Voyage of Bran* (1894), with A. Nutt; *King and Hermit* (1901); *Early Relations of the Brython and Gael* (1896); *Selections from Ancient Irish Poetry* (1911); *Sanas Cormaic, an Old Irish Glossary* (1912);

Learning in Ireland in the Fifth Century (1913); *Ueber die älteste irische Dichtung* (1914). In 1912 a volume of *Miscellany* was presented to him by pupils and friends in honor of his election to the chair of Celtic at the University of Berlin.

MEYER, LEO (1830-1910). A German philologist, born at Bledeln, near Hanover, and educated at Göttingen and Berlin. From 1862 to 1865 he was professor in Göttingen, and in 1865 he became professor of comparative philology at Dorpat. In 1889 he again accepted a chair at Göttingen. His contributions to philological literature, works of great merit, include: *Vergleichende Grammatik der griechischen und lateinischen Sprache* (1861-65); *Die gothische Sprache* (1869); *Handbuch der griechischen Etymologie* (1901). He also wrote *Glauben und Wissen* (1876) and *Ueber das Leben nach dem Tode* (1882).

MEYER, LOTHAR JULIUS (1830-95). A German chemist, born in Varel, Oldenburg. He studied medicine in Zurich and Würzburg and chemistry and physics at Heidelberg, where, in 1857, he made the discovery that the taking up of oxygen by the blood takes place through the chemical affinity between oxygen and the coloring matter of the blood. This view, published in *Die Gase des Blutes* (1857), was supplemented by the study *De Sanguine Oxydo Carbonico Infecto* (1858). In 1859 he became professor at Breslau, in 1866 at Eberswalde, and in 1868 at Karlsruhe, whence in 1876 he went to Tübingen. Meyer also wrote: *Die modernen Theorien der Chemie* (1864; 6th ed., partially, 1896); *Die Atomgewichte der Elemente* (1883), with Seubert; *Grundzüge der theoretischen Chemie* (3d ed., 1902). But he is best known as one of the discoverers of the Periodic Law (q.v.), for which achievement he received the Davy medal of the Royal Society in 1882.

MEYER, mā'yâr', PAUL (1840-). A French philologist, born in Paris on Jan. 17, 1840. He studied at the Ecole des Chartres; served in the manuscript department at the Bibliothèque Nationale (1863-65); and was keeper of the national archives from 1866 to 1872. In 1865 he founded the *Revue Critique*, of which he was joint editor until 1872, when, with Gaston Paris, he established *Romania*. Meyer became secretary of the Ecole des Chartres in 1872, was professor of the languages and literatures of southern Europe in the Collège de France from 1876 until 1906, and from 1882 was director of the Ecole des Chartres. He was elected to the Institute in 1883. His researches into the literature of the Middle Ages, which began with a study of that of Provence and was very comprehensive, involved laborious investigations in many libraries, particularly those of France and England. His works include: *Recherches sur les auteurs de la chanson de la croisade albigeoise* (1865); *Recherches sur l'épopée française* (1867); *Les derniers troubadours de la Provence* (1871; 2d ed., 1901); *Mémoire sur l'étude des dialectes de la langue d'oc au moyen âge* (1874); *Recueil d'anciens textes bas-latins, provençaux et français* (1874-77); *Alexandre le Grand dans la littérature française du moyen âge* (2 vols., 1886); *Nicole de Bozon* (1889); *Guillaume le Maréchal* (3 vols., 1891-1901); *L'Escoufle: roman d'aventure* (1894), with Michelaut; *Guillaume de la Barre: roman d'aventures par Arnaut Vidal de Castelnaudari* (1895); *Histoire des relations de la*

France avec Venise (1896); *L'Apocalypse en français au XIII^e siècle* (1901); *Pour la simplification de notre orthographe*, containing also the report of the commission on the simplification of French orthography (Paris, 1905); *Documents linguistiques du midi de la France* (1909), an important and extensive work. On account of ill health he resigned the editorship of *Romania*.

MEYER, mi'ër, VICTOR (1848-97). A German chemist, born in Berlin. He studied in Berlin and (under Bunsen) at Heidelberg and was appointed professor in the Stuttgart Polytechnikum in 1871 and in 1872 professor of chemistry and director of the chemical laboratory in the Polytechnic Institute of Zurich. In 1885 he became professor at Göttingen, and in 1889 he was called, as Bunsen's successor, to Heidelberg. He carried out a number of investigations in organic chemistry, among the results of which may be mentioned his discovery of thiophene and its derivatives. He also made important contributions to organic stereochemistry. But he is perhaps best known among chemists as the inventor of a practical method of determining the molecular weights of vaporizable substances—a method which is in almost constant use in chemical laboratories. (See MOLECULES—MOLECULAR WEIGHTS.) In addition to numerous contributions to the reports of the German Chemical Society he wrote: *Gutachten betreffend den Verkehr mit Petroleum und anderen feuergefährlichen Flüssigkeiten* (1879); *Probleme der Atomistik* (1896); and, jointly with Jacobson, a brilliant treatise on organic chemistry (vol. i, 1893). The treatise was completed after Victor Meyer's death.

MEYERBEER, mi'ër-bâr, GIACOMO (1791-1864). A famous German composer. He was born at Berlin, of wealthy Jewish parents, and gave early promise of musical talent, which his parents encouraged. Lauska, considered the best teacher in Berlin, superintended his studies, while Clementi took a special interest in his progress and instruction. He made his first public appearance as a boy of nine. In 1806 he became a student under Vogler and entered the latter's academy in Darmstadt, where he formed a friendship with Weber, which proved to be lifelong. Meyerbeer's earliest compositions gave little indication of the success he afterward achieved, and in style were largely ecclesiastical. An opera, *Jephthah's Vow*, dating from this period, is singularly dull and heavy. *Abimelek* (1813) was a comic opera which met with a more favorable reception than any of his previous efforts, and was especially fateful in that it took its composer to Vienna, where he first heard Hummel, whose virtuosity on the piano so impressed him that he postponed all his plans and went into retirement with the object of perfecting his own style. After a brief stay in Paris he went to Venice (1815) and attempted to duplicate Rossini's success with a series of operas in the Italian vein: *Romilda e Costanza* (1815); *Semiramide riconosciuta* (1819); *Emma di Resburgo* (1819); *Margherita d'Angiò* (1820); *L'esule di Granata* (1822); *Il crociato in Egitto* (1824), which latter made a tremendous success. In none of these operas is there the faintest trace of his German training. An attempt to win German favor with the last-named opera proved a failure, as did a similar attempt in Paris. From 1826 to 1831 little was heard of him publicly, but apparently the time

was not wasted. According to Mendel he was devoting himself to the study of the French style, and particularly French opera. His father's death and the subsequent death of two of his children weighed upon him, for he was a man of strong family attachments. He resolved to expatriate himself from Germany and at the same time to desert the Italian for the French style of composition. *Robert le Diable* (1831) and *Les Huguenots* (1836) were the first fruits of his French studies—operas so intimately descriptive of French history and customs as to appeal irresistibly to the French public. Their success was immediate, so much so that, despite the determined opposition of the German classicists, *Robert le Diable*, *Les Huguenots*, *Le Prophète*, and *Dinorah* were all successfully given in Germany. His success in both France and Germany caused the Prussian government to invite him to Berlin, where, in 1842, he was made Royal Music Director. Although not a great orchestral leader, he nevertheless accomplished important results during his stay in Berlin. *Das Feldlager in Schlesien* belongs to this period and had moderate success, as did *Struensee*, a scarcely known work. In 1849 he returned to Paris, where *Le Prophète* was performed with remarkable success. His last opera, *L'Africaine*, on which he had worked on and off for over 30 years, was finished only shortly before his death, which occurred at Paris, May 2, 1864. It was first produced at the Grand Opéra in 1865. Besides these operas he wrote an oratorio, *Gott und die Natur* (1811), a number of cantatas, and some instrumental music. Meyerbeer's importance rests entirely upon his operas. For many years after the composer's death *Robert*, *Les Huguenots*, *Le Prophète*, and *L'Africaine* maintained their popularity, but even before the end of the last century there were unmistakable signs that even these four were rapidly declining. It is not a mere coincidence that in direct proportion as Wagner gained ground Meyerbeer lost it. Throughout his life Meyerbeer strove for only one object—success. He won it by carefully studying the public taste of his time and sacrificing art to the prevailing fashion. It cannot be denied that he was a musician of eminent gifts and a master of technic and form, but he lacked noble ideals and strong artistic convictions. Even a superficial study of Meyerbeer's orchestration must convince the student that it was not the dramatic situation so much as the effect upon the audience that far too often determined the choice of instruments. Hence his frequent juxtaposition of violent dynamic contrasts without inner necessity. His melodies almost always lack distinction and not infrequently sink to the level of the trivial. As an artist Meyerbeer is the direct counterpart of Wagner, and one can accept only the one or the other. Consult: H. Blaze de Bury, *Meyerbeer, sa vie, ses œuvres, et son temps* (Paris, 1865); A. Kohut, *Meyerbeer* (Leipzig, 1890); H. de Curzon, *Meyerbeer: biographie critique* (Paris, 1910); H. Eymieu, *L'Œuvre de Meyerbeer* (ib., 1910); A. Hervey, *Meyerbeer* (London, 1913).

MEYERHEIM, mi'ër-him, FRIEDRICH EDUARD (1808-79). A German genre painter. He was born at Danzig, and studied under his father, and at the Berlin Academy, under Schadow. He was the first to introduce rustic genre scenes into Germany. His subjects are usually good-humored, idyllic, and somewhat sentimental inter-

pretations of the lives of the peasants of the Harz Mountains, Thuringia, and north Germany, and are smoothly and clearly painted. He became a member of the Berlin Academy in 1838 and professor in 1850. Among his works are: "Altenburgers in the Field" (1838); "The King of the Shooting Match" (1836), "Tid-Bit" (1852), both in the National Gallery, Berlin; "Domestic Happiness" (1847), "Going to Church," and "Good Morning, Dear Father!" (1858), all in the Ravené Gallery, Berlin.

MEYERHEIM, PAUL (1842-1915). A German painter, born in Berlin, son and pupil of Friedrich Eduard Meyerheim. He also studied at the Berlin Academy, and traveled and studied in Germany, the Tirol, the Netherlands, and Paris. His later travels were extensive. Although he won distinction in genre, landscape, and portraiture, and as a decorative artist, his fame rests chiefly on his masterly and usually humorous rendering of the animal world. His management of light and shade is admirable, and an idea of his versatility may be gained from the following list of works: "An Amsterdam Antiquary" (1869), "Menagerie" (1885), both in the National Gallery, Berlin, the staircase of which he adorned with a charming frieze in fresco, allegorizing "The Four Seasons" (1883) in the life of birds; "The Life-Course of a Locomotive" (1878), in the Villa Borsig, Berlin; "Sheep-Shearing" (1872); "The Young Lions"; "The Card Sharpers" (monkeys, 1882); "Monkeys in a Studio," and, out of many fine landscapes, a "Charcoal Pit in the Bavarian Alps" (1887, Hamburg Gallery) and "Burning Windmill" (1903). Of numerous excellent portraits those of his father and of Daniel Chodowiecki (1887), both in the Museum at Danzig, are representative examples. He received great gold medals at Berlin (1872) and Munich (1888), and gold medals at Paris, Philadelphia, and Chicago. Consult Meissner, in the *Art Journal* (London, 1895).

MEYER-HELMUND, mi'ér-hél'munt, ERIK (1861-). A Russian-German composer, born in St. Petersburg. He received the rudiments of musical instruction from his father and afterward went to Berlin, where he studied under Kiel and Stockhausen. He became famous in Germany as a song composer, and for many of his songs he himself wrote the words. All his music is marked by strong local color and a distinct individuality. His larger works include the operas *Margitta* (1889); *Die beiden Klingsberg, Der Liebeskampf* (1893); *Heine's Traumbilder* (1908); and the ballet music *Der Berggeist* (1893), followed one year later by the burlesque opera *Trischka*.

MEYER-LÜBKE, lüp'ke, WILHELM (1861-). A Romance philologist, born at Dübendorf in the Canton of Zürich, Switzerland. From 1879 to 1883 he studied at Zürich and Berlin, coming under the influence of Adolf Tobler (q.v.). In 1887 he became professor extraordinary at Jena, and in 1890 was made full professor of Romance philology at Vienna. In 1906-07 he was rector of the university. His works include *Die Schicksale des lateinischen Neutrums im Romanischen* (1883) and the *Grammatik der romanischen Sprachen* (4 vols., 1890-1902), translated as *Grammaire des langues romaines* (4 vols., 1890-1905). This is the most important grammar of the Romance languages since that of Diez. Other books are the *Italienische Grammatik* (1891), the *Einführung*

in das *Studium der romanischen Sprachwissenschaft* (1901; 2d ed., 1909), of which a good Spanish translation, revised by the author, was made by Castro, under the title *Introducción al estudio de la lingüística romance* (Madrid, 1914); *Romanische Namenstudien* (1905); *Die Ziele der romanischen Sprachwissenschaft* (1906); *Historische Grammatik der französischen Sprache* (1908; 3d ed., 1913); *Romanisches etymologisches Wörterbuch* (1911 et seq.); *Prinzipienfragen der romanischen Sprachwissenschaft* (1910); and numerous articles in the *Zeitschrift für romanischen Philologie*.

MEYERSDALE. A borough in Somerset Co., Pa., on Casselman River, 113 miles by rail southeast of Pittsburgh, on the Baltimore and Ohio and the Western Maryland railroads (Map: Pennsylvania, C 8). Its chief industry is the mining of coal, and there are brickkilns, shirt, washing-machine, and maple-sugar factories, planing mills, machine works, cigar factories, etc. Meyersdale was first settled as early as 1776, but the growth of the town dates from the advent of the first railroad in 1871. Coal mining was begun in the following year. Pop., 1900, 3024; 1910, 3741.

MEYNELL, mē'nĕl, ALICE (CHRISTIANA) (c.1853-1922). An English poet and essayist, born in London, a daughter of Thomas J. Thompson, an intimate friend of Charles Dickens. With her elder sister, Elizabeth (Lady Butler, well known for "The Roll Call" and other military paintings), she was educated by her father. The Thompsons lived much abroad, especially in Italy. While a girl, Miss Thompson went over to the Church of Rome and was followed by other members of the family. In 1877 she married Wilfrid Meynell (q.v.). Her first poems, *Preludes* (1875; new ed., 1893), were warmly praised by Ruskin, Rossetti, and Browning. In 1901 she collected in a volume called *Later Poems* a group of short lyrics. Soon after her marriage, Mrs. Meynell began to contribute to the London periodicals, gaining wide recognition for her graceful and delicate style. She published several delightful volumes of essays, as *The Rhythm of Life* (1893); *The Colour of Life* (1896); *The Spirit of Place* (1898). Among her other publications are: *The Flower of the Mind* (1897), an anthology of English poetry; *John Ruskin* (1900); *Ceres Runaway* (1910); *Mary, Mother of Jesus* (1912); *Collected Poems* (1913); *Essays* (1914). Consult William Archer's chapter on her in his *Poets of the Younger Generation* (New York, 1902).

MEYNELL, WILFRID (1852-). An English author and journalist of Yorkshire descent, educated privately at York. He was for many years a journalist and was long editor of the *Weekly Register*. To reviews and periodicals, notably to the *Contemporary Review*, the *Athenæum*, and the *Saturday Review*, he was a frequent contributor. In 1877 he married Alice Thompson. (See MEYNELL, ALICE.) His writings include: *Journals and Journalism* by "John Oldcastle" (2d ed., 1880); *Benjamin Disraeli: An Unconventional Biography* (2 vols., 1903); *Collected Poems* (1913); *Johnson* (1913). He edited *Selections from Newman* (1907) and the *Works of Francis Thompson* (3 vols., 1913), and wrote a biographical sketch of Thompson for the fifth edition of the latter's *Selected Poems* (1909).

MEYNERT, mi'nĕrt, THEODOR (1833-92). An Austrian neurologist, born at Dresden. He

was educated at the University of Vienna; in 1865 was appointed lecturer on anatomy at the university; in 1866 was prosecutor in the Vienna insane asylum; and in 1870, professor of psychiatry. He was a member of the Vienna Academy of Sciences. A member of the staff of the *Psychiatrisches Centralblatt* in 1871-78, he also published several volumes, including *Zur Mechanik des Gehirns* (1874), *Psychiatrie: Klinik der Erkrankungen des Vorderhirns*, etc. (1884), and *Klinische Vorlesungen über Psychiatrie* (1890).

MEYR, mir, MELCHIOR (1810-71). A German poet and novelist, born at Ehrlingen, near Nördlingen. He was educated at Munich and Heidelberg. His most important works are: *Erzählungen aus dem Ries* (4th ed., 1892), his best work; his *Gedichte* (1857); the long political novel *Vier Deutsche* (1861); the tragedies *Karl der Kühne* (1862) and *Herzog Albrecht* (1862); and the anonymous and extremely clever *Gespräche mit einem Grobian* (1866). He also wrote the philosophical *Religion des Geistes* (1871). Consult Bothmer and Carrière, *Melchior Meyr: Biographie, Briefe und Gedichte* (Leipzig, 1874).

MEYRICK, mēr'rik, FREDERICK (1827-1905). A Church of England scholar. He was born at Ramsbury vicarage, Wiltshire; was educated at Trinity College, Oxford, of which he was scholar, fellow, and tutor; and held the university offices of select preacher and public examiner. In 1856 he was appointed one of the Queen's Whitehall preachers, in 1859 inspector of schools, and from 1868 to his death was rector of Blickling, Norfolk, and from 1869 nonresidential canon of Lincoln. He was the chief agent in establishing the Anglo-Continental society for making known the principles of the English church in foreign countries, and wrote much for that purpose. He traveled widely on the Continent, and in 1886-87 was principal of Coddington College, Barbados. He was the author of *The Moral and Devotional Theology of the Church of Rome, According to the Authoritative Teaching of S. Alphonso de' Liguori* (1856); *The Outcasts and Poor of London* (1858); *On Dr. Newman's Rejection of Liguori's Doctrine of Equivocation* (1864); *Is Dogma a Necessity?* (1883); *The Doctrine of the Church of England in the Holy Communion* (1883; 4th ed., 1889); *The History of the Church of Spain* (1892); *Justin Martyr* (1896); *Scriptural and Catholic Truth and Worship* (1901; 2d ed., 1908); *Appeal to the Primitive Centuries* (1904); *Appeal to the Sixteenth and Seventeenth Centuries* (1905).

MEYRICK, SIR SAMUEL RUSH (1783-1848). An English antiquary. He graduated from Oxford University as B.A. in 1804; took several later degrees, and practiced law in the ecclesiastical and admiralty courts. He possessed a very fine collection of armor, and his *Critical Inquiry into Ancient Armour* (splendidly illustrated, 3 vols., 1824; 2d ed., 1844) is still considered authoritative. He assisted Rev. T. D. Fosbrooke in 1823-25 in the publication of the *Encyclopædia of Antiquities*. In 1826 he arranged the arms and armor in the Tower of London, and in 1828 performed the same service at Windsor Castle. During his administration of the office of high sheriff of Herefordshire in 1834 he revived some of the old ceremonial display, including javelin men in full accoutrement. He published also *History and Antiquities of the County of Cardigan* (1810; reprinted,

1907) and an edition of Lewis Dunn's *Heraldic Visitations of Wales* (2 vols., 1846).

MEYWAR. See UDAIPUR.

MEZEN, mǎ-zên'y', or **MESEN**. A river of north Russia. It rises near the north boundary of the Government of Vologda and flows northwest through the Government of Archangel, entering the White Sea at the Gulf of Mezen after a course of about 510 miles (Map: Russia, G 1). It is navigable in its lower part, but is free from ice only about six months in the year.

MÉZERAY, mǎz'rǎ', FRANÇOIS EUDES DE (1610-83). A French historian and man of letters. He was born at Ruy, near Argenton, in the Department of Indre, studied at Caen, and after some military service in Flanders came to Paris and set to writing history. Richelieu patronized him and put him into the Academy. His *Histoire de France* (1643-51) brought him fame and is still of considerable value. During the Fronde he was an active pamphleteer against Cardinal Mazarin.

MEZE/REON (Fr. *méséréon*, Sp. *mezeron*, from Ar. *mēzariyim*, *camellia*). The bark of *Daphne mezereum*, *Daphne gnidium*, and *Daphne laureola* of the family Thymelæaceæ, three shrubs from 2 to 4 feet high. *Daphne mezereum* has rose-red or purple, fragrant flowers, in small clusters, preceding the deciduous leaves. It is indigenous to hilly and mountainous regions of Europe, extending to the Arctic circle and eastward to Siberia, and is cultivated in the United States and established in some localities. The other two species grow in southern Europe. *Daphne laureola*, spurge laurel, has large evergreen leaves and yellowish-green flowers in axillary clusters. *Daphne gnidium*, spurge flax, has narrow, deciduous leaves and small white flowers in terminal racemes. Formerly the bark was extensively employed in medicine. The dried bark is inodorous, but has a persistently acrid and burning taste. The bark of *Daphne gnidium* is darker and that of *Daphne laureola* is more gray and has a greenish cast. They resemble mezereon in acidity. The root bark of the three species is the strongest, but the stem bark is the more common. It is used as an adjunct to sarsaparilla in making the compound decoction and the compound extract of that drug. The juice of the fresh bark is irritant and is said to blister the skin. See DAPHNE.

MEZES, SIDNEY EDWARD (1863-). An American college president. He was born at Belmont, Cal., and was educated at the University of California (S.B., 1884) and at Harvard University (A.B., 1890; A.M., 1891; Ph.D., 1893). He was adjunct professor of philosophy (1894-97), associate professor (1897-1900), professor (1900-08), dean (1902-08), and president (1908-14) at the University of Texas. In 1914 he became president of the College of the City of New York. He received the honorary degree of LL.D. from Southwestern University in 1912 and from the University of California in 1913. He is coauthor of *The Conception of God* (1897) and author of *Ethics, Descriptive and Explanatory* (1901) and articles in reviews on education, ethics, and philosophy.

MEZHIRETCHIE, mēzhē-rě'chyē. A town in the Government of Siedlce, Russian Poland, about 80 miles from Siedlce. It has several educational institutions, manufactures leather, brass articles, etc., and had a population in 1910 of over 14,000, largely Jews.

MÉZIÈRES, mǎ'zyâr'. The capital of the Department of Ardennes, France, at the confluence of the Meuse and Vence, 55 miles north-east of Rheims (Map: France, N., K 3). It is situated in a bend of the river, with the towns of Charleville, Arches, Pierre, and Mohon immediately about it. The sixteenth-century parish church was the scene of the marriage of Charles IX to Elizabeth of Austria in 1570. The town manufactures ammunition and has iron and copper foundries, but most of its iron industry has been transferred to Charleville, with which it is connected by a suspension bridge. It also manufactures dyes. In 1521 the Chevalier Bayard, with 2000 men, successfully defended the place against 40,000 Spaniards under Charles V. In 1815 the town held out for six weeks against the allies, who besieged it after the battle of Waterloo. In the Franco-German War of 1870-71 Mézières capitulated after a cannonade of two days. Its fortifications were razed in 1886. Mézières was the scene of extremely heavy fighting between the Germans and the allies during the European War which broke out in 1914. See WAR IN EUROPE. Pop. (commune), 1901, 7884; 1911, 10,403.

MÉZIÈRES, ALFRED JEAN FRANÇOIS (1826-1915). A French literary critic, born at Rehon (Moselle). Educated at the lyceum at Metz and the French school at Athens, he participated in the revolution of 1848 as captain. After 1885 he was president of the journalistic association of Paris. He became professor of foreign literature at Toulouse (1853), Nancy (1854), and Paris (Sorbonne, 1863); was admitted to the Academy in 1874; and was elected deputy (1881) and Senator (1900). His publications are mainly literary studies. Among them are: *Mémoire sur le Pélon et l'Ossa* (1853); *Shakespeare, ses œuvres et ses critiques* (1861); *Prédécesseurs et contemporains de Shakespeare* (1863); *Contemporains et successeurs de Shakespeare* (1864); *Dante et l'Italie nouvelle* (1865); *Pétrarque* (1867); crowned by the Academy in 1868; *Goethe, les œuvres expliquées par la vie* (1872-73). His *En France* (1883), *Hors de France* (1883), *Mirabeau* (1891), are of political stamp. Later works include: *Pétrarque* (1895), crowned by the Academy; *Morts et vivants* (1897); *Au temps passé* (1906); *Silhouettes de soldats* (1907); *Hommes et femmes d'hier et d'avant hier* (1907); *De tout un peu* (1909); *Pages d'automne* (1911); *Ultima verba* (1914). The *Revue des Deux Mondes* and the *Temps* published many of Mézières' articles.

MÉZIÈRES, MARIE JEANNE LABORAS DE. A French novelist. See RICCOBONI, MARIE J. L. DE.

MÉZIÈRES, PHILIPPE DE (1327-1405). "The old pilgrim," as he called himself, was born at Mézières in Picardy, the youngest of 12 children. He was educated at Amiens. When about 18 years old he took part in the war in Lombardy, and after that, for a time was in the service of Andrew, King of Naples. In 1346 he took the cross and fought at Smyrna, after which he received the honor of knighthood. All the rest of his life was devoted to the cause of the crusades against the Mohammedans. In 1347 he made a pilgrimage to Jerusalem. On his return he stopped at Cyprus and entered the service of Peter of Lusignan. After the latter became King of Cyprus Philippe was his chancellor and accompanied him on his travels in

Europe to kindle zeal for a crusade, and on his expedition against Alexandria. After the capture of this city in 1365 one-third of it was given to Philippe as a foundation for the Knights of the Passion of Jesus Christ, an order which he planned. The city was soon lost and the order was never founded, although it was the lifelong desire of Philippe, who dreamed of a knighthood of 100,000 men devoted to the service of the Holy Land. The members were to take most of the monastic vows, but were to marry in order to have sons to continue their work. After the death of Peter, Philippe returned to the west and in 1372 induced the Pope to adopt for the West the Festival of the Presentation of the Virgin, for which he translated the Greek office. In 1373 he went to Paris and became a councillor of Charles V, from whom he received a pension, and a little later became the preceptor of the Dauphin. In 1380, after the death of Charles V, he retired to the convent of the Célestines at Paris, and thereafter devoted himself to writing in favor of a new crusade. He was one of the most original thinkers of the fourteenth century and his writings are important for the history of France. A full list of them and a lengthy analysis of each are given by Jorga. Among them may be noted a life of his friend and collaborer, Peter Thomas, and the *Songe du vieil pèlerin*, which is a project for a new crusade. He labored by his writings to bring about peace between France and England, in order to make the conditions more favorable for a crusade. He died in the convent on May 29, 1405. Consult: article by Jorga on the letters of Philippe, in *Revue Historique* (Paris, 1892); Nicolas Jorga, *Philippe de Mézières et la croisade au XIV^e siècle* (ib., 1896)—this study supersedes all previous works and renders it unnecessary to quote any of the numerous books which had been written about Philippe; Auguste Molinier, *Les sources de l'histoire de France*, vol. iv (ib., 1904); Louis Bréhier, *L'Eglise et l'Orient au moyen âge* (ib., 1907).

MÉZIRIAC, mǎ'zè'rě'ák', SIEUR DE. See BACHET, C. G.

MEZÖTÚR, mē'zē-tōōr. A town in the County of Jász-Nagykun-Szolnok, Hungary, situated on an affluent of the Körös, 80 miles east-southeast of Budapest (Map: Hungary, G 3). It has a Gymnasium and trades in cereals, wine, horses, and cattle. It has large pottery factories. Pop., 1900, 25,383; 1910, 25,835, mostly Magyars.

MEZ/ZANINE (Fr. *mezzanino*, It. *mezzanino*, from *mezzano*, middle, from *mezzo*, middle, half). An intermediate subordinate story between two main stories; especially, in its strictest sense, such a story interpolated into the upper part of a lofty main story. An intermediate story thus introduced between the ground story and the *premier étage* is called in French the *entresol*. In many European palaces and public buildings accommodations for servants and lodgers have been provided by mezzanines which formed no part of the original design.

MEZZO, mēd'zō (It., middle). A term generally used in music in conjunction with some other word, as *mezzo forte*, moderately loud; *mezzo piano*, rather soft; *mezza voce*, with a moderate strength of tone; *mezzo orchestra*, with half the orchestra; etc. When written alone and applied to the grand pianoforte it indicates that the soft pedal is to be used. Mezzo-soprano

means a voice lying halfway between the high soprano and contralto.

MEZZOFANTI, mĕd'zō-fān'tĕ, GIUSEPPE (1774-1849). An Italian linguist and a cardinal in the Church of Rome. He was born in Bologna, was educated there, and became a priest in 1797 and, in the same year, professor of Hebrew at the university. When the Cisalpine Republic was established he refused to take the oath of allegiance and lost his chair, but was reinstated in 1803 and became university librarian in 1815. In 1831 he went to Rome, where he was appointed librarian of the Vatican and secretary of the College of the Propaganda (1833), and in 1838 was raised to the rank of Cardinal. He acquired a European reputation by his linguistic attainments, and at the time of his death was credited with knowing at least 58 languages. Consult Russell's *Life of Cardinal Mezzofanti* (London, 1858) and the biographies by Manavit (Paris, 1853), Bellesheim (Würzburg, 1880), and Mitterrutzner (Brixen, 1885).

MEZZOTINT, mĕd'zō-tint or mĕz'ō- (It. *mezzotinto*, half colored). A method of engraving on a copper or steel plate, which is prepared by making on it a ground with an instrument called a cradle or rocker. This instrument is a flat plate of hardened steel, of which one side is brought to a segment of a circle with a sharp cutting edge, the bevel of which, engraved with fine parallel lines, resembles a file, and the edge itself is brought to a ridge of very fine points. This has to be rocked across the plate many times, in various directions, until the whole surface is reduced to a close-set mass of small teeth or points. The plate thus pricked offers a uniformly roughened surface, upon which the engraver begins his proper work. Now, this prepared plate, if inked and printed from, would yield an entirely black impression; so it is the business of the engraver to work from dark to light, or from black to white. This he does with various instruments, such as the scraper, employed to diminish the burr and such asperity of surface as tends to retain too much ink, and the burnisher, to remove all surface roughness when the highest light or pure white is required in the picture he is producing.

Mezzotint is admirably adapted to the reproduction of those works in which broad effects of light and shade are dominant, as opposed to those where close line, contour, and small detail are demanded. Mezzotint has another limitation—its failure to bear much printing. The burr is soon destroyed in the copper plates, and, although steel is more enduring, mezzotint on this medium is still far behind line engraving in reproductive possibilities. From 25 to 30 impressions of the first class are all that may be drawn from copper plates. The original inventor or discoverer of mezzotint engraving was Louis von Siegen, a lieutenant colonel in the service of the Landgrave of Hesse-Cassel, and his first published work was a portrait of the Princess Amelia Elizabeth of Hesse, dated 1642, 15 years anterior to the earliest date on the plates of Prince Rupert, to whom a charming legend ascribes the invention of the art.

The art is peculiarly identified with eighteenth-century Britain, among the greatest mezzotint engravers being James McArdell (died 1765), James Watson, J. Raphael Smith, and Valentine Green. In their work were mirrored the achievements of a national school of portraiture. The process served also for genre and sporting

scenes, and later on for David Lucas's reproduction of Constable's landscapes and Turner's famous *Liber Studiorum*. In the United States the mezzotint style was a favorite with magazine publishers in the early days of magazines, being introduced from England by John Sartain (q.v.) in 1830. In recent years Arlent Edwards and others have reproduced paintings in mezzotints printed in color. Consult: P. G. Hamerton, *The Graphic Arts* (London, 1882); J. C. Smith, *British Mezzotint Portraits* (4 vols., ib., 1883); Hubert von Herkomer, *Etching and Mezzotint Engraving* (ib., 1892); A. Whitman, *Masters of Mezzotint* (ib., 1898); C. J. H. Davenport, *Mezzotints* (ib., 1904); Julius Leisching, *Schabkunst: ihre Technik und Geschichte in ihre Hauptwerken von XVII. zum XX. Jahrhundert* (Vienna, 1913). See ENGRAVING.

MHOW, mou. A city and important British military station in the State of Indore, Central India Agency, 13 miles southwest of the town of Indore, near the Vindhya Mountains, on an eminence on the Gumber River 1800 feet above the sea (Map: India, C 4). On the southeast are the cantonments, arranged like a European town, having a spacious lecture room, a well-furnished library, three schools, and a theatre. They are occupied under the Mandasaur Treaty of 1818 by a considerable force of British and native troops. Pop., 1901, 36,039; 1911, 29,820.

MIAGAO, mĕ'ā-gā'ō. A town of Panay, Philippines, in the Province of Iloilo (Map: Philippine Islands, D 5). It is situated on the south coast of the island, 22 miles west of Iloilo. Pop., 1903, 20,656.

MIAKO, mĕ-ā'kō. A city of Japan. See KYOTO.

MIALl, mī'al, EDWARD (1809-81). An advocate of English church disestablishment. He was born in Portsmouth, England; studied at Wyndley Theological Institute, Hertfordshire; entered the Congregational ministry, and was installed pastor at Ware in 1831 and at Leicester in 1834. Becoming an active advocate of the disestablishment of the Church of England, he removed to London and established the *Nonconformist* newspaper as the organ of that policy in 1841. He represented Rochdale (1852-67) and Bradford (1869-74) in Parliament. He favored universal suffrage and opposed class legislation and compulsory religious education. He led in the establishment, in 1844, of the British Anti-State Church Association, which afterward became the Society for the Liberation of Religion from State Patronage and Control. In 1856 he introduced in the House of Commons a resolution on the disestablishment of the Irish church. His motion for a committee on the disestablishment of the English church was introduced three times in 1871 and 1872 and lost. He was appointed in 1858 a member of the Royal Commission on Education as a representative of the Nonconformists. Among his principal publications are: *Views of the Voluntary Principle* (1845); *Ethics of Nonconformity* (1848); *The British Churches in Relation to the British People* (1849); *The Franchise as a Means of a People's Training* (1851); *Title Deeds of the Church of England to her Parochial Endowments* (1862); *Social Influences of the State Church* (1867). Of less polemical character is *An Editor off the Line, or Wayside Musings and Reminiscences* (1865). A *Life of Miall* was published by his son, Arthur Miall (London, 1884).

MIAMI, mī-ā'mĕ. A town in Gila Co., Ariz.,

11 miles by rail from Globe, on the Arizona Eastern Railroad. It is in a rich copper district, the mining of which constitutes the town's sole industry. Water and electric power are derived from the Roosevelt Dam and Reservoir (see DAMS AND RESERVOIRS), which is 40 miles distant. Miami was incorporated in July, 1914. Pop., 1915 (local est.), 6500.

MIAMI, mī-ām'i. A city and the county seat of Dade Co., Fla., 366 miles south of Jacksonville, on the Florida East Coast Railway (Map: Florida, F 6). Trucking and fruit growing are the chief industries of the surrounding country, and large quantities of grapefruit, oranges, avocados, limes, and winter vegetables are shipped to northern markets. Miami on account of its remarkably equable climate is a popular winter resort, being situated on Biscayne Bay, one of the largest natural harbors on the east coast of Florida, and at the mouth of the Miami River, which is the eastern terminus of one of the large canals draining the Everglades. The winter homes of James Whitcomb Riley, William Jennings Bryan, and others of national prominence are situated here, and there are many hotels and boarding houses. Other noteworthy features are the courthouse and school buildings, a fine yacht club, and a bridge across the bay $2\frac{1}{2}$ miles in length. Pop., 1900, 1681; 1910, 5471; local estimates place the population in 1915 as about three times that of 1910; 1920, 29,549.

MIAMI. A city and the county seat of Ottawa Co., Okla., 30 miles southwest of Joplin, Mo., on the St. Louis and San Francisco, the Missouri, Oklahoma, and Gulf, and the Oklahoma, Kansas, and Missouri Interurban railroads (Map: Oklahoma, G 2). Lead and zinc mining, lumbering, and the growing of cereals are the chief industries. The water works and electric-light plant are owned by the municipality. The commission form of government was adopted in 1909. Miami was the first town in the former Indian Territory to be built on land purchased and set apart for town purposes by the act of Congress. Pop., 1900, 1893; 1910, 2907.

MIAMI. An important Algonquian tribe residing, when first known to the French about 1660, in southeastern Wisconsin. They were somewhat superior to the northern tribes generally in their manner of living, and occupied a stockaded town with mat-covered houses. About the year 1690, in consequence of difficulties with the Illinois and Sioux, they removed to the southeast and established themselves on the site of what is now Chicago and upon the St. Joseph River of Michigan, whence they soon spread to the Wabash and Maumee and later to the Miami. Their principal band made headquarters at Kekionga, where Fort Wayne now stands, while others, settled lower down on the Wabash, developed later into two distinct tribes, known respectively as Wea and Piankishaw (q.v.). All three, however, continued until the end of the eighteenth century to regard themselves as one people, and first cousins of the Illinois, their western neighbors, whose language differed only dialectically from their own. In the Colonial wars the Miami sided alternately with either party, but joined Pontiac's alliance in 1764 and took sides against the Americans in the Revolution, continuing the struggle with the other tribes of the Ohio valley until their crushing defeat by General Wayne compelled them to

make peace at the Greenville Treaty in 1795. The great chief, Little Turtle, who led the allied forces to victory against St. Clair and Harmar, was a Miami. Under Tecumseh they again joined the English side in the War of 1812. At its close, being now thoroughly broken, they began to sell their lands, and by 1827 had ceded almost the whole of their original territory and agreed to remove to Kansas. Here they rapidly died out from disease, famine, and dissipation, until about 1873 the remnant, only 150 in number, were placed upon the Quapaw reservation, in Oklahoma, where they number now 123. A considerable band had continued to occupy a reservation in Wabash Co., Ind., until 1872, when the land was divided and tribal relations dissolved. These now number about 90, practically all of mixed blood.

MIAMI, or **GREAT MIAMI**, **RIVER**. A river of western Ohio, formed by the confluence, in Logan County, of several small streams which rise in Auglaize and Hardin counties. It flows in a slightly southwesterly direction, joining the Ohio River at the Indiana State line (Map: Ohio, B 6). Its length is about 140 miles and its drainage area 5400 square miles, about two-thirds of its basin being within Ohio. Its more important tributaries are the Stillwater River and the Mad River, which join the main stream near Dayton, and the Whitewater, which comes in a few miles above its mouth. The sources of the river are at an elevation of about 1000 feet above sea level. The Miami and Erie Canal parallels the river from Hamilton to Piqua.

MIAMISBURG, mī-ām'z-bûrg. A village in Montgomery Co., Ohio, 46 miles north by east of Cincinnati, on the Great Miami River and the Miami and Erie Canal and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Ohio Electric, and the Cincinnati, Hamilton, and Dayton railroads (Map: Ohio, B 6). It is an important industrial centre, the manufactures being favored by good water power, and including paper mills, carriage and buggy works, steel furniture, safe and tobacco factories, wheel works, etc.; and is also an important market for tobacco, which is cultivated extensively in the adjacent region. There is a Carnegie library. The water works and electric-light plant are owned by the municipality. Just outside of the corporate limits is the largest Indian mound in the State. A large part of the village was inundated in March, 1913, by the overflow of the river. The property damage amounted to about \$1,500,000. Pop., 1900, 3941; 1910, 4271.

MIAMI UNIVERSITY. A coeducational institution of learning at Oxford, Ohio, founded in 1809. The first school was opened in 1816 and the university proper began its work in 1824. It has a college of liberal arts and a normal college. A considerable freedom is allowed in the election of studies. In 1914-15 the faculty numbered 51 and the attendance was 651. The library contained 47,000 volumes. The institution was endowed in 1809 with one township of land in Ohio, and receives financial aid from the State, the endowment amounting to \$104,000 and the income to about \$213,000. The college campus occupies about 114 acres. The grounds, buildings, and equipment were valued in 1914 at \$835,000. The president in 1915 was Raymond M. Hughes, A.M.

MIANA (mī-ā'nā) **BUG**. See **MITE**.

MIANTONOMO, mī-ān'tō-nō'mō. A Narragansett sachem, who succeeded his uncle, Ca-

nonicus, in 1636. He was on friendly terms with the early settlers of Massachusetts and assisted them during the Pequot War of 1637. In 1643 he conducted an unsuccessful expedition against Uncas, the Mohegan sachem, his bitter rival, with whom, however, he had agreed in 1638 not to open hostilities without first appealing to the whites. Being captured, he was handed over by Uncas to the Commissioners of the United Colonies, and was tried by an ecclesiastical court organized for the purpose, which condemned him to death and commissioned Uncas to carry out the sentence. A brother of the latter soon afterward killed the unsuspecting captive on the spot now called Sachem's Plain (near Norwich, Conn.), where he had originally been captured. A monument erected there in 1841 commemorates the event.

MIAO-TSE, mè-ü'ò-tsé, or **MIAU-TSI**, also known as **MÁNS-TIERA**, **MÁNS-COC**, and **MEO**. The inhabitants of the mountainous regions of southern China, in parts of the provinces of Hupeh, Szechuan, Yunnan, Kweichow, Hunan, Kwanghsi, and Kwangtung. They number several millions and represent an aboriginal population of this portion of the Celestial Empire driven back in recent times by the Chinese. Many of the Miao-tse tribes are under Chinese rule, but some of them still maintain their independence. The Miao-tse are shorter in stature than the northern Chinese, and apparently not Mongoloid in form and features. Consult: Edkins, *The Miautsi Tribes* (Foochow, 1870); Henry, *Lingnam* (London, 1886); Bourne, *Journey in Southwest China* (ib., 1888); A. H. Keaw, *Man: Past and Present* (Cambridge, 1900). See **CHINA**, *Ethnology*.

MIAULIS. See **MIAULIS**.

MIAS. See **ORANG-UTAN**.

MIASMA mi-áz'má (Neo-Lat., from Gk. *μῆμα*, stain, from *μᾶλιν*, *miainein*, to pollute). A term formerly applied to any disease which was thought to arise from polluted air. Miasma has had slightly different meanings at different times, but has been most generally used to indicate certain imponderable morbid emanations from the soil of particular localities. Since the discovery of the specific plasmodium of malaria and its conveyance by the mosquito, the term "miasma" has lapsed into disuse and is now rarely seen in medical literature. See **MALARIA** AND **MALARIAL FEVER**; **INSECTS**, **PROPAGATION OF DISEASE BY**.

MIASSKY ZAVOD, mé-ás'kê zà-vôd'. A mining town in eastern Russia in the Government of Orenburg, situated among the Ural Mountains, 35 miles west of Cheliabinsk and near the railroad to that town. Its mines produce over 17,000 ounces of gold annually. Pop., 1897, 16,100; 1910, 25,479.

MIAULIS, mè-ou'lés, **ANDREAS VOKOS** (c.1768-1835). A Greek admiral, born in the island of Negropont. Vokos, or Bokus, was his family name, the surname Miaulis being derived from the Turkish word for felucca. For long a merchant captain, he gave his services and his property heartily to the cause of the Greek revolution in 1821 and was put in command of the Greek fleet, consisting of a great number of small craft. In March, 1822, he defeated a Turkish squadron at Patras and in September another squadron near Spezzia. In 1825 he burned the fleet commanded by Ibrahim Pasha near Modon. In 1827, upon the appointment of the Englishman Lord Dundonald as his superior

in command, he loyally continued to serve as a subordinate. He was restored to his old rank by President Capo d'Istria. He participated in the insurrection of 1831 and burned the fleet under his command at Poros, to keep it out of the hands of the Russians. He opposed the President's Russian policy and was actively engaged in the bitter controversies of the period. In 1832 the naval stations in the Archipelago were placed in his charge, and he served on the deputation sent to Munich to offer the crown to Prince Otho of Bavaria. In 1839 a monument was erected to him in Syra.

MIAU-TSI. See **MIAO-TSE**.

MIAVA, mè-ô'vô. A city of the County of Neutra, Hungary, on the Miava River, at the foot of the Little Carpathians, 56 miles north-east of Vienna (Map: Hungary, E 2). The manufacture of woolen and linen goods and bagging is the chief industry. Pop., 1900, 10,639; 1910, 10,063.

MICA (Neo-Lat., from Lat. *micare*, to flash; confused with and influenced by *mica*, crumb). A group of minerals that crystallize in the monoclinic system and consist essentially of aluminium silicate with varying proportions of potassium, sodium, lithium, iron, magnesium, etc. The different species are characterized by a basal cleavage, yielding thin, tough scales that are colorless to jet black. The principal members of the group include the following: *Muscovite*, or common mica, called also potassium mica, as it is essentially an aluminium and potassium silicate. The colorless varieties of muscovite are used in the doors of stoves and as lamp chimneys. It is also employed as an insulating material, in wall-paper manufacture, as a lubricant, and when ground it is used as an absorbent for glycerin in the manufacture of dynamite. During 1913, 1,700,677 pounds of sheet mica were mined in the United States. *Paragonite*, or sodium mica, is similar to the foregoing, except that the sodium replaces the potassium in its composition. It is of a yellowish to greenish color. *Lepidolite*, or lithium mica, is a potassium, lithium, aluminium silicate, also containing fluorine, and is of a rose or peach-blossom color. It finds some use for ornamental purposes and is a source of lithium salts. *Zinnwaldite* is of a complex composition, containing iron in addition to the potassium, lithium, and aluminium silicates. In color it is of a pale violet or yellow to brown and dark gray. *Biotite* (q.v.), or magnesium iron mica, is a magnesium, potassium, and iron silicate. It is usually dark-colored, as green, brown, or black. *Phlogopite* is also a magnesium mica, generally nearly free from iron, and usually containing some fluorine. It is usually dark in color, being yellowish brown to brownish red. *Lepidomelane* is an iron mica generally black in color. The micas occur in crystalline rocks, muscovite being a normal constituent of granite, gneiss, and similar rocks. The deposits from which sheet mica is obtained are found in a coarse granite called pegmatite. The preparation of mica for the market is comparatively simple. The blocks, after being hoisted from the mine, are freed from adhering rock and then split by means of wedges or heavy knives. After this the mica is cut up into sizes suitable for the market, usually in pound packages. The mica waste is utilized as described previously under *Muscovite*. Consult G. W. Colles, *Mica and the Mica Industry* (New York, 1906); H. S. de Schmid, *Mica, its Occurrence, Explora-*

tion, and Uses (2d ed., Ottawa, 1912); Hans Zeitler, *Mica, its History, Production, and Utilization* (London, 1913); also the volumes of the *Mineral Resources, United States Geological Survey* (Washington, annually).

MICA, PEARL. See MARGARITE.

MI'CAH (Heb. abbreviation of *mikāyāh*, interpreted as, Who is like Yahwe?). One of the minor prophets, a contemporary of Isaiah. His book is sixth in the ordinary arrangement of the minor prophets, but third according to the Jewish canon, and this order is followed in the Greek version. All that we know of his life is that he was a native of Moresheth, a small town dependent upon Gath (Mic. i. 1; Jer. xxvi. 18), and that his activity falls in the reigns of Ahaz and Hezekiah, but hardly in the days of Jotham; roughly speaking, therefore, between 734 and 700 B.C. The Book of Micah, in its present form, may be divided into three sections, each beginning with "Hear ye." (1) Chaps. i and ii, addressed to all the people, describe the coming of Yahwe in judgment on the transgressions of Israel and Judah and the doom of Samaria; denounce luxury and covetousness as the sources of transgression and condemn the false prophets for leading the people astray; foretell the banishment of the people into captivity and promise their return under the guidance of Yahwe. (2) Chaps. iii-v, addressed to the heads and princes of the people, condemn their oppressive rapacity and declare that as they had been deaf to the cry of the poor in their wrongs, they, too, shall call on Yahwe, but will not be heard. The false prophets also who had deceived others shall themselves be made ashamed. This second threatening of judgment is followed by a second and fuller promise of a better time. (3) In chaps. vi and vii Yahwe, calling on the people to hear and on the mountains to be witnesses of the controversy, appeals to all His past government over Israel as approving His righteousness. The people, answering, complain that the burden of the sacrifices required is too great to be borne, and Yahwe, in reply, says that He asks of them only to do justly, love mercy, and walk humbly with God. That they had failed to comply with these demands is shown by the treasures of wickedness found in their houses, by the scant measures used, the false balances, the deceitful weights. For these crimes punishments will be inflicted; the wheat, the oil, and wine shall be cut off. The prophet mourns the justice of the sentence and acknowledges the guilt of all classes of the people. Yet he waits for the salvation of Yahwe, triumphing in His pardoning mercy, which will certainly be manifested, and in His faithfulness, which will perform all that He had solemnly sworn to Abraham in the days of old.

These three divisions, however, do not correspond either to the original order or character of the discourses embodied in the book. The first three chapters (with the exception of ii. 12-13) depict conditions prevalent prior to the destruction of Samaria and may be attributed to the prophet Micah, though with editorial additions and adjustment to the rest of the book. Chaps. iv and v, however, with their glimpse into future times, are regarded by many scholars as embodying the views and aspirations of the struggling postexilic religious community, weighted by the sense of guilt, regarding its own sufferings as a punishment for transgressions in the past, and looking forward to a re-

demption and restoration of national glory, which can only come from Yahwe Himself. There are reasons for supposing that chaps. i-v once formed the entire Book of Micah, the first three being by the prophet himself and forming the text, as it were, to the last two chapters, justifying the sufferings in postexilic days. By way of consolation the prophecy of the restoration of the Davidic dynasty was composed and added. In the same spirit, as a comment upon the real Micah, chaps. vi and vii are supposed to have been written, which again present the same two sides—Yahwe's justification in bringing such sufferings upon His people and the consolatory promises for the future. Chaps. iv-vii, according to this view, belong in the main to the latter part of the Persian period, with minor additions thought to have been made in still later times. The text of the Book of Micah, it should be added, is not well preserved, and this enhances the difficulties of a satisfactory interpretation.

Elhorst, *De profetie van Michä* (Arnhem, 1891); the commentaries on the minor prophets, especially those of Julius Wellhausen (3d ed., Berlin, 1898), W. Nowack (2d ed., Göttingen, 1903), Karl Marti (Tübingen, 1904), R. F. Horton (Oxford, 1906), Van Hoonacker (Louvain, 1908), and G. A. Smith (new ed., 2 vols., New York, 1912); the Old Testament Introductions quoted under EXEGESIS.

MICARE DIGITIS. See LA MORRA.

MICA SCHIST. A metamorphic rock (q.v.) possessing a schistose or foliated structure and composed essentially of the minerals mica and quartz. The mica is generally the colorless variety known as muscovite (q.v.), though the dark variety, biotite, may be present also. When garnet or staurolite is present in addition to the quartz and mica, the rock is designated a garnetiferous or a staurolitic mica schist. Probably the greater number of mica schists have been formed by the metamorphism of sedimentary rocks through the agency of orographic (mountain-building) forces. Other mica schists, and especially the variety known as sericite schists, have been developed from acid igneous rocks (q.v.) by the action of the same forces. Of many mica schists, and especially those of Pre-Cambrian age, it has been found impossible as yet to determine whether their origin is sedimentary or igneous. See METAMORPHIC ROCKS.

MICAWBER, MR. WILKINS. In Dickens's *David Copperfield*, an imprudent, unpractical, and visionary character, believed to be intended as a portrait of Dickens's father, and Mrs. Micawber is said to represent his mother.

MICELLAR THEORY (from Neo-Lat. *micella*, dim. of Lat. *mica*, crumb). A theory proposed by the botanist Nägeli in 1862 to account for the physical properties of organized bodies like starch grains, cell walls, etc. He assumed that the molecules of the chemist are united into larger unions, constituting molecules of a higher order, which he called micellæ. These

hypothetical micellæ are extremely minute, never being visible even with the highest powers of the microscope. He further claims that the growth in thickness of a cell wall is due to the intercalation (intussusception) of new micellæ of cellulose between the micellæ which have become widely separated from each other by the stretching of the wall. Strasburger, the most important opponent of the micellar theory, holds that the growth in thickness of a cell wall is due to the deposition of material upon its inner surface. The micellar theory is still current, but is not so strongly supported as formerly.

MICHABO, mē-chā'bō. See MANABOZHO.

MICHAEL, mī'kā-ēl or mī'kēl (Heb., Who is like God?). One of the archangels. In Dan. x. 13 he is called "one of the chief princes"; in x. 21, "Michael your prince"; and in xii. 1, "the great prince which standeth for the children of thy people." It is thought by some scholars that Michael is also meant by "the one like unto a son of man" in Dan. vii. 13. In Ethiopic Enoch ix, 1, Michael appears as one of the four great angels, with Uriel, Raphael, and Gabriel; in xl, 9 and lxxi, 9, Phanuel takes the place of Uriel; while in xx, which gives the oldest list of the seven archangels (Uriel, Raphael, Raguel, Michael, Saraqael, Gabriel, and Remiel), he occupies fourth place. In Jude 9 Michael is represented as fighting with the devil for the body of Moses; this account was taken from the Apocalypse of Moses, though it is not extant in the part of the Latin version of this work that has been preserved. In Rev. xii. 7-9 he fights against the dragon. His special function, as described in Enoch, is to act as scribe in entering in the heavenly books the deeds of the angelic patrons of nations, while in the *Ascension of Isaiah* he records the deeds of all men in the heavenly books. According to the Talmudic account, Michael is the prince, the chief of the angels, the high priest who in the fourth heaven offers the souls of the departed as a sacrifice. He is looked upon as the medium through whom the Law was given to Moses on Mount Sinai. In the Western Christian church, September 29 (Michaelmas) has been set aside as his day; the Greek church keeps November 9. Zimmern has shown that some of the conceptions connected with Michael represent attributes of Babylonian gods, like Marduk and Nebo, transformed to angels.

H. Charles, *The Book of Enoch* (Oxford, 1912).

MICHAEL, mī'kēl or mī'kā-ēl. The name of nine emperors of Constantinople.—**MICHAEL I** (died 845) succeeded to the throne on the death of Stauracius, in 811, conducted a war against the Bulgarians, but was a feeble monarch, who abdicated without fighting against Leo the Armenian, a general in his service, in 813 and, retiring to a monastery, passed the remainder of his life in devotional exercises.—**MICHAEL II** (died 829), surnamed the Stammerer, was born in upper Phrygia, of an obscure family, but was ennobled by Leo the Armenian, who, however, afterward condemned him to death

on a charge of conspiring against him. His life was saved by the assassination of Leo, and Michael was crowned Emperor in 820. He was cruel and arbitrary. His reign was threatened by a revolt on the part of his general Euphemius, who proclaimed himself Emperor. The rebellious general was slain near Syracuse in Sicily. During Michael's reign the Saracens wrested Crete and Sicily from the Empire.—**MICHAEL III** (c.838-867), surnamed the Drunkard, was grandson of Michael II and succeeded his father, Theophilus, in 842, his mother, Theodora, being Regent until 856. In his reign the Varangians appear as foes to the Empire, and the foundation for the separation of the Eastern and Western churches was laid by a quarrel between the Patriarch, Photius, and the Pope, Nicholas I. Michael was assassinated by Basil the Macedonian in 867.—**MICHAEL IV** (died 1041), surnamed the Paphlagonian, from the place of his birth, was raised to the throne by the Empress Zoë, who on account of her infatuation for him is suspected of having murdered her husband. He was successful in war against the Bulgarians in 1040, but died in 1041.—**MICHAEL V** succeeded the last named, who was his uncle. Having exiled the Empress Zoë, he was overthrown by the people in 1042 and, after having his eyes put out, was sent to a monastery.—**MICHAEL VI** succeeded the Empress Theodora in 1056, but retained the throne only a year, when he was compelled to resign in favor of Isaac Comnenus. He retired to a monastery. He was surnamed Stratioticus, and with him the Macedonian dynasty became extinct, his successor being of the family of the Comneni.—**MICHAEL VII** DUCAS, or PARAPINACES (starver), was a son of Constantine X, and after the regency of his mother Eudoxia he ascended the throne in 1071. Having given too much power to unworthy favorites, he was forced by an insurrection to abjure the throne in 1078 and retire to a monastery.—**MICHAEL VIII** PALÆOLOGUS (1234-82) was the first of his family to ascend the Byzantine throne. He was proclaimed joint Emperor of Nicaea with John Lascaris about 1259, and soon after became sole ruler. In 1261 Constantinople, which had been held by the Latins since 1204, was captured, and Michael caused his young colleague to be blinded and dethroned. In order to retain possession of the capital he made some pretense at an attempt to bring about a union of the Western and Eastern churches, which, however, proved to be of short duration.—**MICHAEL IX**, son of Andronicus II, was associated with his father, but died before him in 1320. See BYZANTINE EMPIRE. Consult: Edward Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury, vols. v, vi (London, 1898), for all the above; for Michael I, II, III, J. B. Bury, *History of the Eastern Roman Empire* (ib., 1912); for Michael VIII, Edwin Pears, *Destruction of the Greek Empire* (ib., 1903), and Alice Gardner, *Lascarids of Nicaea* (ib., 1912).

MICHAEL, ARTHUR (1853-). An American chemist, born in Buffalo, N. Y. He studied at Berlin and Heidelberg and at the Ecole de Médecine of Paris. In 1882-89 and from 1894 to 1907 he was professor of chemistry in Tufts College; in 1912 he became professor of organic chemistry at Harvard. His researches in organic chemistry include studies in a new process for the formation of aromatic sulphones, in forming aldol from ethyl aldehyde,

in the action of aldehydes and aromatic oxyacids on phenols, and in new reactions with sodium malonic ester. His writings include contributions to the *Proceedings of the National Academy of Science*, to the *American Chemical Journal*, and to the *Berichte der deutschen chemischen Gesellschaft*.

MICHAEL ANGELO. See MICHELANGELO.

MICHAEL ATTALIA'TES. A Byzantine jurist of the eleventh century. By command of Michael Ducas, Emperor of the East, he published in 1073 a work entitled *Πόρῃμα νομικὸν ἥτοι σύνοψις πραγματικὴ*, i.e., a compendium of law. He also wrote other works, including a history of the period from 1034 to 1079. A Latin rendering of the *Synopsis* by Leunclavius is to be found in his second volume of the compilation *Jus Græco-Romanum*. The *History* is published in the Bonn edition of the corpus of Byzantine writers. Consult Karl Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897).

MICHAELIS, mē'kă-ă'līs, ADOLF (1835-1910). A German archæologist. He was born at Kiel and studied at the university of his native town, in Berlin, and in Leipzig. After 1862 he was professor of classical philology and archæology at Greifswald, Tübingen, and Strassburg. In 1873 he edited *Bilderchroniken*, by O. Jahn, his uncle and teacher, a discussion of the Greek inscribed reliefs of mythological and historical scenes. In 1874 he became a member of the German Central Archæological Institute in Rome, the history of which he published in 1879, in *Geschichte des deutschen archäologischen Instituts zu Rom*. Besides his critical edition of Tacitus' *Dialogus de Oratoribus* (1868) and articles in the periodicals, he published many archæological treatises, such as *Der Parthenon* (1871); *Ancient Marbles in Great Britain* (Eng. trans. by Fennell, 1882); *Strassburger Antiken* (1901); *Die archäologischen Entdeckungen des neunzehnten Jahrhunderts* (1906; Eng. trans. by Bettina Kahnweiler, *A Century of Archæological Discoveries*, 1908). He also prepared editions of Springer's *Handbuch der Kunstgeschichte* (1898, 1901, 1904, 1907).

MICHAELIS, JOHANN DAVID (1717-91). A German biblical scholar. He was born on Feb. 27, 1717, at Halle, where his father, Christian Benedict Michaelis, was professor. After completing his studies at the university of his native town he traveled in England and Holland. In 1746 he became professor of philosophy at Göttingen and in 1750 professor of Oriental languages. From 1753 to 1770 he was one of the editors of the *Göttinger gelehrte Anzeigen*, and for some years he filled the office of librarian to the university. He died at Göttingen, Aug. 22, 1791. Michaelis may be regarded as among the earliest to use Oriental critical learning in the service of biblical interpretation. His chief works are his *Hebräische Grammatik* (1778); *Einleitung in die göttlichen Schriften des neuen Bundes* (4th ed., Göttingen, 1788; Eng. trans., *Introduction to the New Testament*, London, 1823); *Mosaisches Recht* (2d ed., 1776-80; Eng. trans., *Commentaries on the Laws of Moses*, 1810-14); *Moral* (1792-1823); *Orientalische und exegetische Bibliothek* (1786-93). Consult his *Lebensbeschreibung von ihm selbst abgefasst*, edited by Hassencamp (Rinteln, 1793); his letters (Leipzig, 1794-96); his *Life* by R. Smend (Göttingen, 1898); T. K. Cheyne, *Founders of Old Testament Criticism* (London, 1893).

MICHAËLIS, KAROLINE. See VASCONCELLOS, KAROLINE MICHAËLIS.

MICHAËLIS, mī-kă-ă'līs, SOPHUS (1865-). A Danish author, born at Odense. Educated at the University of Copenhagen, he traveled extensively abroad and wrote *Solblomster* (1893), a collection of poems, and the romance *Æbelø* (1895), which were successful. Later appeared *Sirener* (1898), a collection of poems; *Livets Fest* (1900); *Palmerne* (1904), impressions from Egypt; the novels *Dødedansen* (1900) and *Giovanna* (1901); the dramas *Revolutionsbryllup* (1906), *Lægen* (1906), *St. Helena* (1911), and *Den evige Søn* (1912). His lyric verse, showing French influence, represents his best work. He wrote also a monograph on Jens Jerichau, the sculptor (1906), and edited *Kunst* (1900-06). His translations of Flaubert's *Salammbô*, *Aucassin et Nicolette*, and *Tentation de St. Antoine* were excellent.

KARIN MICHAËLIS STANGELAND (1872-), Michaëlis' first wife, separated from him and married an American. For purposes of authorship she wrote her name as above. She was born (Beck-Brøndum) at Randers. Her poems and novels include: *Høit Spil* (1898); *Fattige i Aanden* (1901); *Barnet* (1902); *Hellig Enfold* (1903); *Gyda* (1904); *Munken gaar i Enge* (1905); *Betty Rosa* (1908); *Tro som Guld* (1909); *Den farlige Alder* (1910); *Bogen om Kjærlighed* (1912); *Grev Sylvains Hævn* (1913); also *Danske Foregangsmænd i Amerika* (1911), with Joost Dahlerup.

MICHAELIUS, mē-kă'lē-us, JONAS (1577-?). The first clergyman of the Dutch Reformed church in New Amsterdam. He was born in north Holland. In 1600 he entered the University of Leyden and after his graduation became a country pastor. In 1624 he was appointed to São Salvador in Brazil, the next year to a settlement in Guinea, and in 1628, after a short visit to Holland, he sailed for New Amsterdam. His ministrations there probably lasted until 1633, when he was succeeded by Everardus Bogardus (q.v.). A letter written by him in 1628 and now in the manuscript collection of the New York Public Library gives the only extant first-hand account of New Amsterdam as it then was. A translation of this letter appears in the *Collections of the New York Historical Society* for 1880.

MICHAELMAS, mik'el-mas (from *Michael* + *mass*). The old English name of the day set apart in commemoration of St. Michael and the other angels, September 29. The observance of this day is commonly traced to an apparition of the archangel which is supposed to have taken place on Monte Gargano in Apulia in 493, or more probably in 520; but it is likely, for various reasons, that the festival is even older. This particular apparition is commemorated in the Roman Catholic church on May 8; the feast day in September has a wider application, in the Eastern and Anglican churches as well, and is intended to recall the benefits received through the ministry of angels. In England it has been for centuries an important date as a quarter day and the beginning of legal and university terms. For the old beliefs and customs connected with the day, consult Robert Chambers, *The Book of Days* (new ed., 2 vols., London, 1906).

MICHAEL NIKOLAIEVITCH, mī'kēl nē'-kô-lă'yē-vich (1832-1909). Grand Duke of Rus-

asia, the fourth son of the Emperor Nicholas I. In the artillery branch of the army he was elevated to the rank of general. He was for some time Governor of the Caucasus and in 1877 commanded the army which invaded Turkish Armenia. In 1881 he was made President of the Privy Council of State and commander in chief of the cavalry.

MICHAEL OBRENOVITCH (ô-brén'ô-vîch) III (1823-68). Prince of Servia, born at Kraguevats, the younger son of Prince Milosh. After the death of his elder brother Milan in 1839 he was declared Prince of Servia by the Turkish government. He soon made himself very unpopular by favoring the Russian policy, and the discontent of the Servian people was increased by his policy of arbitrary and heavy taxation. A revolution broke out in 1842, and an act of the National Assembly expelled him and his family from the country. He fled to Semlin in Slavonia and lived in Vienna and Berlin, spending several years in traveling. In 1858 he returned to Servia, together with his father, whom he again succeeded in the government in 1860. He was a man of great ability and seemed honestly desirous to do his best for the country. He was successful in effecting cardinal changes in the military organization and freed the Servian fortresses from Turkish garrisons. On June 10, 1868, he was shot by a follower of Prince Alexander Karageorgevitch. He was succeeded by his cousin Michael Obrenovitch IV.

MICHAEL ROMANOV. CZAR OF RUSSIA. See ROMANOV.

MICHALOWSKI BLASTING POWDER. See EXPLOSIVES.

MICHAUD, mê-shô', JOSEPH FRANÇOIS (1767-1839). A French historian, born at Albens in Savoy. He studied in the ecclesiastical college of Bourg and in 1787 published a work, *Voyage au Mont Blanc*, followed by other essays. In 1791 he went to Paris, where he embraced the teachings of Voltaire and Rousseau. He was, however, a Royalist and advocated his views in the three Royalist papers, the *Gazette Universelle*, the *Postillon de la Guerre*, and the *Courrier Républicain*. In 1794 he founded the *Quotidienne* and after the fall of Robespierre he contributed articles so openly favoring the Restoration that on Oct. 27, 1795, he was condemned to death, and only escaped by having this sentence commuted to one of banishment. In 1799 he returned to Paris and with a younger brother undertook the publication of the *Biographie moderne, ou dictionnaire des hommes qui se sont fait un nom en Europe depuis 1789*. His work *Tableaux historiques des trois premières croisades* began to appear in 1811, though not completed until 1822. Michaud was made member of the French Academy in 1812; the previous year he had founded, with his brother, the *Biographie universelle*. He also collaborated with Ponjoulat in editing the *Collection de mémoires pour servir à l'histoire de France*, which began to appear in 1836. In the *Dernier règne de Buonaparte* (1815) Michaud made a valuable contribution to Napoleonic history. He died at Passy, Sept. 30, 1839. In 1792 Michaud wrote a work *L'Apothéose de Franklin*, of interest to Americans.

MICHAUD, mê-shô', GUSTAVE (1870-). A French literary critic, born at Perrigny. He taught French literature in various institutions before becoming a lecturer at the University of Paris in 1904. In 1911 his lectures in the

United States were well received. Several of his works were crowned by the Academy. Michaud became an authority on Pascal and Sainte-Beuve, his publications including: *Edition des pensées de Pascal* (1896); *De l'abrégé de la vie de Jésus* (1897); *Des Discours sur les passions de l'amour de Blaise Pascal* (1900); *Le génie latin* (1900); *Aucassin et Nicolette* (1901); *Les époques de la pensée de Pascal* (1902); *La comtesse de Bonneval* (1903); *Sainte-Beuve avant les lundis* (1903); *Etudes sur Sainte-Beuve* (1904); *Etude sur le livre d'amour de Sainte-Beuve* (1905); *La Bérénice de Racine* (1907); *Pages de critique et d'histoire littéraire* (1910); *Histoire de la comédie romaine* (1912); *La Fontaine* (1913).

MICHAUX, mê'shô', ANDRÉ (1746-1802). A French botanist and traveler. He was born at Satory, near Versailles, and studied under the noted botanist Bernard de Jussieu. In 1779 he traveled in England, and the next year through Auvergne and the Pyrenees, and, on his return to Paris, introduced several new varieties of Spanish grain and other plants. In 1782 he was sent to Persia on a scientific mission. From 1785 on he traveled extensively in eastern North America on a similar mission at government expense, but the French Revolution compelled him to return for want of funds. He was shipwrecked on the voyage to France and lost nearly all his specimens. In 1800 he sailed for Madagascar, where he died two years later. His most important publications are *Histoire des chênes de l'Amérique septentrionale* (1801) and *Flora Boreali-Americana* (1803).

MICHAUX, FRANÇOIS ANDRÉ (1770-1855). A French botanist, son of André Michaux. He accompanied his father to the United States, and his *Histoire des arbres forestiers de l'Amérique septentrionale* (3 vols., 1810-13) contains the result of his explorations and gives an account of the distribution and the scientific classification of the principal American timber trees north of Mexico and east of the Rocky Mountains. Under the title *The North American Sylva* it was translated by Hillhouse, with three supplementary volumes on the trees of the Rockies by T. Nuttall (1841-49).

MICHEL, mê'shêl', CLAUDE, called CLODION (1738-1814). One of the most prominent French sculptors of the rococo period. He was born in Nancy and studied in Paris under his uncle, J. S. Adam, and under Pigalle. In 1759 he won the first prize for sculpture and in 1762 removed to Rome, where he remained nine years. Clodion was a typical representative of the graceful, coquettish, and often immoral art which was fashionable in France before the Revolution. He showed inexhaustible fantasy and skill in his small delicate figures, usually of terra cotta, and reliefs representing nymphs, fauns, cupids, and the like, by which he is chiefly known, but in the more serious works, such as the statue of Montesquieu, now in the Palais de l'Institut, Paris, and the "Vestal Crowned with Flowers," the noble lines and fine arrangement of drapery rank him among the best masters of the age. After the Revolution he attempted to adopt the new classical style, but without much success. His reliefs for the Arc du Carrousel and the Colonne de la Grande Armée date from this late period. He modeled also many charming decorations for private palaces, which have not survived. Most of his terra cotta and marble statuettes, vases, candelabra, etc., are pre-

served in private collections; there are several examples in the J. P. Morgan collection, on loan in the Metropolitan Museum, and this museum owns (Altman collection) two particularly fine specimens. The statue and relief of St. Cecilia in Rouen Cathedral also deserve mention. Clodion was elected an associate of the Academy, but never attained a full membership. Consult Thirion, *Les Adam et Clodion* (Paris, 1885).

MICH'EL, DAN (i.e., *Dominus* or Master Michael), OF NORTHGATE (fl. 1340). An English translator. Nothing is known concerning his personal history except that he was a brother in the cloister of St. Augustin of Canterbury. In 1340 he completed his translation of *La somme des vices et des vertus*, a moral treatise, founded on *Le miroir du monde* (c.1250), and written in 1279 by Frère Lorens, a Dominican monk, for the use of Philip II of France. The translation is entitled the *Ayenbite of Inwit* (the again biting of the inner wit) or the *Remorse of Conscience*. The work gives a detailed exposition of the Ten Commandments, the twelve articles of faith, the seven petitions of the Lord's Prayer, the seven gifts of the Holy Spirit, and the seven heads and ten horns of the beast in the Apocalypse. Interesting in itself, it is of great linguistic value, as it is written in the dialect of Kent. Consult the edition by Morris, *Early English Text Society* (London, 1866).

MICHEL, mē'shēl', FRANCISQUE XAVIER (1809-87). A French historian and antiquary. He was born in Lyons and educated there. He went to Paris and in 1833 he was sent by Guizot to England to examine documents pertaining to the ancient history of France. In 1837 he was in Scotland on the same mission. He edited many monuments of old French literature, among them the *Chanson de Roland* and the *Roman de la rose*. His historical works include *Histoire des races maudites de la France et de l'Espagne* (1847); *Les Ecosais en France et les Français en Ecosse* (1862); *Recherches sur le commerce pendant le moyen-âge* (1852-54); *Le pays basque* (1857).

MICHEL, FRANÇOIS EMILE (1828-1909). A French painter and writer on art, born in Metz. He was the pupil of Migette and Maréchal, the glass painter, and began to exhibit in 1853. His paintings include "Autumn Sowing" (1873) and "The Dunes near Haarlem" (1885), both in the Luxembourg. He contributed articles on art to the *Gazette des Beaux-Arts* and other periodicals and published *Les musées d'Allemagne* (1886); *Rembrandt* (1886; Eng. trans., 1903); *Jacob van Ruysdael et les paysagistes de l'école de Haarlem* (1890), and other biographies for the series, *Les artistes célèbres*; *Les Maîtres du paysage* (1906; Eng. trans., *Great Masters of Landscape Painting*, London, 1910); *Nouvelles études sur l'histoire de l'art* (1908); *La forêt de Fontainebleau* (1909). He was elected a member of the Institute in 1892.

MICHEL, LOUISE (1830-1905). An anarchist agitator, called the Red Virgin. She was the illegitimate daughter of the son of the master of the château of Vroncourt, in the Department of Marne, France; received a good education from her grandfather and went to Paris, where she taught school till the rising of the Communists in 1871. She joined them, fought among the insurgents, and was taken prisoner by the Versailles troops. Tried by court-martial, she was condemned to death, but her sentence was

commuted to transportation to New Caledonia. Freed in 1880, she devoted herself to agitation among the poor in Paris, and was sentenced in 1883 to six years' imprisonment. She was released, however, in 1886 and went to London, whence she continued to carry on her propaganda. In 1895 she returned to Paris. She published two novels, two plays, and her *Mémoires* (1886). Consult E. Girault, *La bonne Louise* (Paris, 1906).

MICHELANGELO, mē'kāl-ān'jā-lō (MICHEL-AGNIOLLO BUONARROTI) (MICHAEL ANGELO) (1475-1564). A Florentine sculptor, painter, architect, and poet, the most prominent artist of the High Renaissance and the most influential figure in modern art. He was born at Caprese, March 6, 1475, the son of Lodovico Buonarroti. His family, the Buonarroti-Simoni, held small landed possessions and had long been honorably identified with public office in Florence. At the time of Michelangelo's birth his father was podestà (governor) of Chiusi and Caprese, Tuscan mountain towns tributary to Florence. The infant was christened Michelagnuolo (Florentine for Michelangelo), and upon his father's return to Florence was put to nurse with the wife of a stonemason of Settignano, imbibing, as he himself said, the love of sculpture with his nurse's milk. Destined for a scholar, he was then placed in the school of Francesco d'Urbino at Florence. Instead of devoting himself to books he spent his time drawing, and with painters' apprentices. By one of these, Francesco Granacci, with whom he had formed a friendship, he was introduced to the studio of the brothers Ghirlandaio, and, after much opposition on the part of his family, he was, in 1488, apprenticed to these masters. He does not appear to have acquired much besides a conscientious execution and sound knowledge of the fresco technique. His drawings while there excited admiration and surprise, as did also his first painting, a transcript on panel of Martin Schongauer's print, the "Temptation of St. Anthony."

In company with Granacci Michelangelo left Ghirlandaio's studio in 1489, to study sculpture in the garden of the Medici at San Marco. With the design of reviving sculpture, which had fallen behind painting at Florence, Lorenzo de' Medici had established an academy there, at the head of which he placed Bertoldo, a pupil of Donatello. A marble masque of a faun (Uffizi), which Michelangelo skillfully changed in accordance with the advice of Lorenzo, so pleased the latter that he invited him to live in his house, and procured his father a place in the Florentine customs. In the society of such men as Poliziano the poet, Pico della Mirandola, Marsilio Ficino the Platonist, and Lorenzo himself, he became familiar with Italian literature and humanist culture. He was also influenced by the great political and religious movements of the day. To the spell of Savonarola's eloquence may be attributed, at least in part, his intense love for Florentine liberty and his deep religious feeling. His artistic training was an admirable combination of Florentine realistic and classic influences. Through Bertoldo he became grounded in the works of Donatello; he studied the antique in the Medici collection and sketched Masaccio's frescoes in the Brancacci Chapel. He was also, perhaps at this early period, and certainly later in his career, influenced by the painting of Luca Signorelli, who alone among the early painters

used the human nude to express emotion. Of the two surviving works of his student days—both bas-reliefs now in the Casa Buonarroti, Florence—the seated “Madonna with the Infant Jesus” is in the manner of Donatello. The other, the so-called “Battle of the Centaurs,” is in the over-rich style of late Roman reliefs, which were doubtless his models; but it shows the great, though still incipient, dramatic talent which marked his later works.

On the death of Lorenzo in 1492 Michelangelo returned to his father's house. Besides carving a statue of a Hercules, now lost, he devoted much time to the study of anatomy. In 1494 he returned to the palace of the Medici, where Lorenzo's impetuous son Piero now presided, but, frightened at a vision foretelling their destruction, in October of the same year he fled to Bologna and thence to Venice. At Bologna he found employment for almost a year upon the shrine of San Domenico. He completed a statue of San Petronio by Nicola da Bari, and carved a kneeling angel of rare beauty, bearing a candelabrum, which, as Grimm has shown, was long confounded with another by Nicola in the same church. At Bologna he saw on the façade of San Petronio the reliefs of Jacopo della Quercia (q.v.), a Sienese sculptor of great power and originality and related to himself in spirit. The influence of this master, strengthened during a later visit to Bologna, is seen as late as Michelangelo's frescoes of the Sistine Chapel. Returning to Florence, in 1495 he carved for Lorenzo de' Medici, of a younger branch of the family, a statue of the youthful St. John, which is usually identified with an original in the Berlin Museum, though Wölfflin thinks the latter a work by Girolamo da Santa Croce (d.1537). The sale of his next work, a “Cupid,” of which the original is lost, caused his first journey to Rome, and during his stay there, which lasted till the spring of 1501, he executed a number of important works. For Jacopo Galli he carved the “Bacchus” in the Museo Nazionale, Florence, a statue realistic to the verge of ugliness, and lacking entirely the element of divinity. To the same period is usually assigned the well-known statue in South Kensington Museum, which may be the “Cupid” that Condivi says Michelangelo executed for Jacopo Galli, although Springer has shown that this statue is more probably an “Apollo.” The subject represented is a beautiful youth kneeling in the act of discharging his bow. But the chief work of this early Roman period, which raised him to the rank of the greatest sculptor of the day, was the “Pieta” in St. Peter's Church (1498-99), the first group, in the highest sense of the word, in modern sculpture. Seated at the foot of the Cross, the Virgin is represented with the dead Christ in her lap, gazing sadly at his wounded side and gently raising her hand. She is of youthful appearance, and of more heroic proportions than her son, whose dead body, the flesh of which is treated with marvelous delicacy, is reduced in size to preserve the harmony of the group.

After his return to Florence in 1501 Michelangelo, on June 5, signed a contract for 15 statues of saints for the Piccolomini Chapel in the cathedral of Siena. The inferior quality of these works as they now stand is such that it is impossible to attribute them to him. In August of the same year he received from the city of Florence a commission for a statue of David,

9 cubits in height, to be carved from a single block of marble. The statue was of national importance, intended to mark the deliverance of the city from the Medici and Cesare Borgia. On June 8, 1504, it was erected to the right of the entrance to the Palazzo Vecchio, where it remained as a sort of palladium until, in 1873, it was removed to the Academy of Fine Arts for protection against the weather. The figure is frankly naturalistic, head and hands being unduly large, as in the case of the undeveloped youthful frame. The expression denotes expectation and confidence of victory; the action represented is at the moment at which the youth is about to unloose the string.

The “David” is the last work of Michelangelo's early or realistic period. A number of other works of the years 1501-04 cannot be exactly dated. While engaged on the “David” he completed, at the request of the signory, another statue of the same subject in bronze, which was sent as a present to a high official of the French court. Resembling the “Pieta,” though probably somewhat earlier, is the life-size “Madonna of Bruges,” purchased by the Mouscron family and still in their chapel in the cathedral of Bruges. He also carved two circular bas-reliefs of the Madonna, one in the Museo Nazionale, Florence, another in the Royal Academy, London. While executing the “David” he was also engaged in painting a “Madonna” for Angelo Doni (Uffizi). Though deficient in color this picture is wonderful in drawing and in the sturdy realism of the figures and is original in conception. Somewhat earlier than this is the unfinished Madonna in the National Gallery, London.

Michelangelo's second manner is characterized by an increasing departure from the realism of his early days and a reliance upon an unbridled imagination. His first work in which this new style prevails was his cartoon for the fresco of one of the long walls of the hall of the Great Council in the Palazzo Vecchio, executed in rivalry with Leonardo da Vinci (q.v.), to whom the other wall had been assigned. Begun in August, 1504, the cartoon was not completed till 1506, the fresco never having been carried out. The subject was the so-called “Battle of Pisa,” an incident from the war between Florence and Pisa, in 1364, when 400 Florentines were surprised by the enemy while bathing in the Arno at Anghiari. This was considered by contemporaries as his greatest painting, and practically revolutionized Florentine art. The cartoon was destroyed in 1516, and only survives in drawings at Holkham and Vienna (Albertina) and in the well-known line engraving of a single group by Marcantonio, entitled “Les Grimpeurs.”

Its execution was interrupted early in 1505 by a summons to the artist from Rome by Pope Julius II, who of all Michelangelo's patrons best understood the man and his art. His first commission was for the Pope's sepulchral monument, to be placed under the cupola of the new church of St. Peter's, and to contain 40 colossal statues, besides bronze reliefs and other decorations. Michelangelo spent over eight months in Carrara procuring the marble for this, the darling scheme of his life. But when, after his return to Rome, the Pope, moved by the intrigues of Bramante, wished to defer the execution of the monument, and the artist was slightly treated, he left Rome in a rage, sending the Pope word to seek him elsewhere. Notwithstanding the latter's efforts and the mediation of the Florentine govern-

ment a reconciliation was not effected till the end of 1506, at Bologna, which the Pope had just added to the papal domains. Until Feb. 21, 1508, the artist was occupied with the bronze statue of Julius II, three times life size, which was destroyed when the Bentivogli recovered the city three years later. Upon rejoining the Pope at Rome he was induced, much against his will, to undertake the decoration of the vault of the Sistine Chapel.

It was a task of colossal proportions (the ceiling alone measuring 132 feet by 44 feet) and he did it practically alone. In October, 1521, the scaffolding was removed. Immediately upon its completion it was hailed as the greatest piece of work ever done by painter's hand. Even Raphael's style was transformed after he had seen it. Michelangelo arranged the vast space as though it had been roofless, framing it with architecture in perspective delusion and filling the open spaces with paintings. Just above the windows are the figures of the ancestry of Christ in attitudes of eager waiting; above them, 12 gigantic figures of the prophets and sibyls; in the corners, four representations from the history of Israel; while in the centre of the vault the stories of the "Creation of the World," the "Fall of Man," and the "Deluge" are told in nine pictures. The spaces of the architecture are filled with figures of male nudes, generally termed "slaves" (*schiavi*), in various attitudes. Among the central pictures the "Creation of Adam" is preëminent. Adam is depicted just on the point of rising, just as God's touch sends the first thrill of life through his veins. His body is the perfection of anatomical form and action, and the representation of the Almighty as the incarnation of omnipotence and mild compassion has never been equaled. The Delphic sibyl is young and beautiful, with an upturned look of rapture, the Cumæan is old and withered, the wisdom of the ages in her countenance. Of the prophets, Jeremiah is the image of deep thought and Zechariah a type of mental absorption; Jonah, typical of the resurrection, is a nude figure of remarkable foreshortening. In a clever and convincing critique Professor Wölfflin has established the chronological order in which the various subjects were painted. Among surviving figures intended for the tomb as originally planned are the two incomparable "Slaves" in the Louvre. One struggles with mighty effort to free himself from the bonds which hold him, the other sinks exhausted from the struggle. Both are an epitome of power and pathos. Belonging also to the original design are four rough-hewn figures now in the Florentine Academy.

On the death of Julius II in 1514 Michelangelo resumed work on his mausoleum, in accordance with a second plan on a slightly reduced scale, a pen-and-ink drawing of which is in the Uffizi. He was thus occupied till 1516; during this time he executed, at least in part, the most important of the statues intended for it. Foremost of these is the "Moses"—certainly the greatest colossal statue in modern art. Moses is portrayed at the moment when, enraged at the idolatry of the Israelites, he starts, with threatening brow, to quell and crush them. The technical execution is perfect, even to such details as the mighty beard, which his hand grasps convulsively, the muscular forearm, and the wonderful fold of drapery upon his knee. The two "Captive Youths" in the Louvre, also termed

"Prisoners" and "Slaves," are ideal representations of the arts, dying and captive because of the death of their great patron.

In December, 1516, Michelangelo was compelled by the wishes of Pope Leo X, a Medici, to remove to Florence and busy himself with a façade for San Lorenzo, the family church of the Medici. He wasted three years of his life in the quarries of Carrara and Pietra Santa procuring the marble for this colossal design, when in 1520 the Pope gave up the plan. Then Cardinal Giulio de' Medici commanded his services for the Medicean Chapel in the same church, upon which work was begun in 1521. During this period he found time for the "Christ Risen," now in the church of the Minerva, Rome, upon which the finishing touches were put by the sculptor Frizzi—a figure which may justly be termed mannered, since it is rather an athlete than a Christ. Upon Cardinal Medici's elevation to the papacy as Clement VII, in 1523, the artist's entire time was taken up by the designs and statues for the Medicean Chapel and plans for the Laurentian Library. This work, however, was interrupted by the last great struggle of Florence for liberty.

Upon the sack of Rome by the army of Charles V, in 1527, the citizens arose and drove the Medici from Florence. Though he had never taken active part in public life Michelangelo was an ardent patriot, willing to serve his country. On Jan. 25, 1529, he was chosen one of the nine citizens in charge of the defense of the city, and on April 9 he became governor of the fortifications. His work took him to Pisa and Livorno, and he visited the Duke of Ferrara, the greatest Italian authority on fortifications. But convinced that Malatesta Baglioni, the general of the mercenaries, meant to betray Florence—as was actually the case—in September, 1529, he fled to Venice. He was received with great honor by the Doge and the nobility, but, declining their hospitality and the invitation of the King of France to enter his service, he returned to Florence and resumed his duties on the fortifications. After the capitulation of the city, Aug. 12, 1530, he remained for a time in hiding, but, on the Pope's invitation and pardon, resumed work on the statues for the Medicean Chapel. He had also received a commission from the city for a colossal "Hercules and Cacus," to stand opposite the "David," in commemoration of the expulsion of the Medici, but he only made the wax model now in South Kensington Museum. A copy of Michelangelo's "Leda and the Swan," a tempera painting executed some time later for the Duke of Ferrara, is at Dresden.

The chapel of the Medici—the new sacristy of San Lorenzo—is the most important work of its kind in modern art. In sculpture it marks the culmination of Michelangelo's style. The architectural problem was not constructive but decorative; and, conceived as a framing for the sculptures, the architecture is above criticism. The sculptures were only in part executed. On the entrance wall is an incomplete statue of the Madonna (1522) by Michelangelo, flanked by the patron saints of the Medici, Cosmas by Montorsoli, and Damian by Montelupo. Far more important are the tombs of the two Medicean dukes, on opposite sides of the chapel. The dukes are represented over life size, seated above their sarcophagi, and are rather allegorical than portrait statues—the representatives of contemplative and active life. Lorenzo's head rests

MICHELANGELO

"CREATION OF ADAM," FROM THE FRESCO IN THE SISTINE CHAPEL OF THE VATICAN

heavily on his wrist, and the beaver of his helmet is drawn over his eyes, which gaze on vacancy. Giuliano is represented as the victorious general looking down upon the battle field. Nothing could exceed the technical perfection of his Roman cuirass and of his hands resting upon the general's staff. At Lorenzo's feet, reclining upon the sarcophagus, are "Dawn" and "Twilight"; at Giuliano's, "Day" and "Night." "Dawn" is the most finished and beautiful of the statues; she starts as if from a dream, her face full of despondency. In "Night," a sleeping woman of magnificent physique, the sculptor has solved the difficult problem of a reclining figure in profile. "Twilight" and "Day" are male figures of Herculean proportions, the heads of which are unfinished. "Day," the grander of the two, is represented as gazing over his shoulder, showing treatment of the muscles of the back in this difficult position. In reality these allegories, intended for quite another purpose, were used by the artist to express his sorrow for the loss of Florentine liberty.

Though chiefly engaged upon the Medicean statues Michelangelo had also worked at Rome upon the tomb of Julius II. Luckily he was there when Clement VII died in 1534. As Duke Alessandro of Florence was bitterly hostile to him he remained at Rome, residing there until his death. At last he hoped to complete the mausoleum, which had been the darling scheme, as well as the bane, of his life. By threats and lawsuits the heirs of Julius II had embittered his existence during the reigns of Leo and Clement, but the popes used their power in his behalf, forcing the heirs to repeated changes of contract, each of which reduced the scale of the monument. Paul III was as unwilling as his predecessors to forego the glory of being served by Michelangelo. He annulled the contract with the Duke of Urbino, Julius's heir, compelling the latter to make a new one in 1542, according to which the tomb was finally erected before 1550. As it now stands in the church of San Pietro in Vincoli, the monument is but a shadow of the artist's great design. The statues adorning the lower part are, by Michelangelo himself—the colossal "Moses" and on either side "Active Life" ("Leah") and "Contemplative Life" ("Rachel"). In their present position, which was not the one originally intended, the two female statues are dwarfed by the architectural surroundings. The statues of the upper story were imperfectly executed, after Michelangelo's designs, by Montorsoli, the best of them being a Madonna, begun by the designer himself. Four rough-hewn figures are now in the Academy, Florence.

Having thus freed the sculptor from all cares regarding the monument, Paul III required his services for the completing of the decoration of the Sistine Chapel. The entire altar wall (18 meters by 16) was to be covered by a painting of the "Last Judgment," the cartoon for which had been executed under Clement VII, but which was not carried out until 1534-41. It is the largest fresco in the world, containing above a hundred figures over life size. The centre of the composition is Christ, a beardless figure of Herculean proportion, in the act of condemnation, and the Virgin sits shrinking beside him. From all sides the terrified masses stream to the judgment seat. Below the graves are opening and the dead become flesh. The colors have suffered much from dust and candle smoke and the grand

figures are much defaced. Their nudity having aroused adverse criticism, Paul IV employed Daniele da Volterra to clothe the most conspicuous examples—a task for which he received the name of "Il Braccetone" (the breeches maker). Michelangelo's last paintings (finished in 1550) were for the same patron—two large frescoes in the Pauline Chapel—the "Conversion of St. Paul" and the "Crucifixion of Peter," both of which were spoiled by restoration.

The last years of the artist's life were devoted chiefly to architecture. In 1546 he designed the beautiful cornice of the Farnese Palace and in 1547 he was appointed chief architect of St. Peter's. He accepted the post as a religious duty, refusing all pay, and until his death, through the reigns of five popes, he filled with credit this responsible position. Only the cupola of the present edifice, for which he left a model, was carried out, at least in part, according to his plans. Unfortunately he left no model for the whole church. We know, however, that he returned to Bramante's plan of a Greek cross, and that his design was much superior to the present building. (See SAINT PETER'S CHURCH.) His architectural works included plans for the Porta Pia and the transformation of the Baths of Diocletian into Santa Maria degli Angeli, which was unfortunately rebuilt during the eighteenth century, although his court of 100 columns survives. The general plan of the Capitoline Hill is due to him, the grand staircase and the Palace of the Senators being after his designs. He made a number of grand designs for the church of the Florentines at Rome and one for the well-known staircase of the Laurentian Library, Florence, which was carried out by Vasari. Finally, his plans were followed in the new fortifications of Rome.

The latter part of Michelangelo's life was dominated by deep religious feeling, which found expression in his drawings and poetry, besides the grand religious paintings and works of architecture upon which he was engaged. Of wonderful pathos and deep religious feeling is the unfinished sculptured group, the "Deposition from the Cross," which now stands behind the high altar in the cathedral of Florence. But the Florentine patriot was revealed in his bust of Brutus (Museo Nazionale), carved when Duke Alessandro was assassinated by Lorenzino in 1539. Though living almost like a hermit, Michelangelo received every honor that could come to an artist. Under successive popes he was chief architect, painter, and sculptor of the Vatican; he was made head of the new Academy of Florence. Popes, kings, and princes sought the honor of a work by his hand. He died Feb. 18, 1564. His body was conveyed secretly from Rome and buried at Santa Croce, the Pantheon of Florence. His house in Florence was left by the last surviving member of the family to the city, and is now used as a museum of his works, containing the family archives.

In appearance he was of medium height and broad-shouldered; he had a large head, with broad forehead and protruding temples, small eyes, and a nose disfigured by a fist blow of Torrigiano, a fellow pupil in the Medici Gardens. He was of a noble and generous character. If lovingly treated, any favors could be obtained from him; but if treated otherwise, not even the popes could influence him. Some of his most charming traits were his devotion to his family, his obedience and humility towards his father,

a selfish and whimsical man, and his kindness to his greedy brothers. He was kind and gentle to his dependents and fair in his judgment of other artists; but if he thought himself ridiculed his tongue could be sharp enough. The sad experiences of a highly sensitive nature tended to make him increasingly suspicious and irritable. Nevertheless, he remained charitable and generous, and he was scrupulously honest at a time when this was a virtue exceedingly rare.

No biography of Michelangelo could omit mention of the beautiful friendships which formed the chief joy of his declining years. Chief among these was his friendship for Vittoria Colonna, which began with his sixtieth year. The popular idea, which sees in this noble old lady the artist's Juliet, is quite erroneous, for their relation was based on a common love of literature and art and common religious views. In Cavalieri, a handsome and accomplished young Roman nobleman, as in other young friends, he saw an idealization of youthful beauty.

Michelangelo has been admirably characterized by Burkhardt as the "Man of Destiny" in the arts. Never in history were they so dominated by a single personality. For centuries the forms which he originated dominated architecture and sculpture, as the baroque style, and, to a large extent, painting as well. That which most impressed his followers and his contemporaries was the quality which the Italians call *terribilità*—his stormy energy of conception and intense dramatic, even violent, action. With him this was natural, the result of his own stormy emotions; with his imitators it was mannerism. His art is sublime rather than beautiful; its chief attribute is power. It does not condescend to win, but overwhelms by intellectual grandeur of conception and technical perfection of execution. It is absolutely original and unique. Evident in his earliest works, this quality predominates increasingly in his art, becoming arbitrary in later life. He is a destroyer of traditions, a creator of new types. Such an artist cannot be said to belong to any school; he stands apart in a class for himself.

He had, perhaps, as perfect a command of line as has ever been achieved. For his own works, as well as independent of them, he drew great numbers of designs, sometimes as many as a dozen heads to evolve an ideal type. Nearly all the chief galleries of Europe possess specimens of these drawings. In early life the pen was his favorite instrument; but later, when he relied more upon memory, he preferred chalk as a softer medium. To this last period belong the most celebrated examples, like the "Phaeton," "Tityus," and "Ganymede," drawn for Tommaso Cavalieri; the series of designs for Christ's "Crucifixion" and "Deposition," meditative and deeply religious in mood; and the "Archers" (Windsor collection), nude figures of wonderful beauty and movement.

His knowledge of anatomy is probably more nearly perfect than that of any artist since the Greeks. He acquired it in long years of diligent study, not only of the nude model and of classic sculpture, but through use of the dissecting knife in a laboratory furnished by his enlightened friend, the prior of Santo Spirito in Florence. He preferred to represent the human body as highly developed, and he inclined to the male type. His women, likewise of fully devel-

oped charm, are mostly types of middle life, although he created a few youthful examples of rare beauty, like the Delphic sibyl and the Madonna of Bruges. Like the Greeks, he used the human figure as expressive of emotion, only that with him the emotion is particular instead of general. Unlike other Italians he generalizes the faces, refusing all portraiture.

Michelangelo was essentially a sculptor, and only painted under protest. As his sonnet so beautifully states, he saw in every block of marble an imprisoned idea awaiting the sculptor's art to be freed. He probably made previous sketches, and in his early period used the human model, but his usual method was to use only a small wax model. Unlike present-day sculptors, he did all the work, even the rough-hewing, himself. He finished the bodies first, reserving the heads for the last. In his paintings the essentially pictorial qualities of perspective, atmosphere, and light are absent; nor was he a colorist in the Venetian sense. His color scheme was broadly massive and subdued, being subordinated to the human figures in his pictures. His paintings are decorative in the highest sense, and in his artistic development they are of especial importance, because he found a more facile medium in painting than in sculpture for the expression of his titanic thoughts. His architecture was decorative rather than constructive. He regarded only the general effect, which he obtained by heavy masses of light and shade, requiring of detail only a sharp and effective formation. In the cupola of St. Peter's, however, he created a complete constructive masterpiece, as perfect as any of the early Renaissance.

Michelangelo's poetry was valued as highly by his contemporaries as were his other artistic activities. They admired especially its deep philosophic thought, in which respect he indeed stands above the other poets of his day. Indeed, the value of his poetry is rather psychological than literary; it is often obscure and labored in expression. But when his nature was stirred by powerful emotions it found expression in some of the most beautiful sonnets and madrigals in the Italian or any other language. Some of the very finest are dedicated to Vittoria Colonna and Tommaso Cavalieri; these are mostly love poems. Others, like madrigals on the loss of Florentine liberty, are patriotic in character, and many are deeply religious, expressing the dignified attitude of a great soul, calmly awaiting the end.

Bibliography. The most important sources for the life of Michelangelo are the documents preserved in the Casa Buonarroti, Florence, consisting mainly of letters to and from the artist, his poems, memoranda, contracts, and like material, and a large collection of his letters purchased by the British Museum in 1859 from one of the Buonarroti family. The latter were first made known to the public by Hermann Grimm in his *Leben Michelangelos*; a selection of the former was indifferently edited by Milanesi, *Le lettere di Michelangelo* (Florence, 1875), and by Sebastiano del Piombo, *Les correspondants de Michel Ange* (vol. i, "Sebastiano del Piombo," Paris, 1890). By far the best edition of the letters, comprising all of historical importance, many for the first time published, is that of Carl Frey (Berlin, 1899). A brief selection of these letters, affording a picture of the artist's life, will be found in Carden's *Michelan-*

MICHELANGELO

"MOSES," FROM THE STATUE IN THE CHURCH OF SAN PIETRO IN VINCOLI, ROME

gelo (Boston, 1915). Of high importance also are the contemporary biographies of Michelangelo. The earliest of these appeared in the first edition of Vasari's *Lives* (Florence, 1550). The inaccuracies of this account impelled Ascanio Condivi, then an inmate of Michelangelo's household, to write his brief biography (Rome, 1553; later ed., Pisa, 1823; Eng. trans. in Charles Holroyd, *Michael Angelo Buonarroti* (New York, 1904). Based on the recollection of the great artist himself, this is the most important and reliable source, after his correspondence. It was pirated without acknowledgment by Vasari in his second edition of the *Lives* (1568; ed. by Milanesi, Florence, 1878), who supplied valuable additional information on Michelangelo's later years. Both of these biographies, together with other contemporary biographical materials, are best edited by Frey, *Sammlung ausgewählter Biographien Vasaris* (Berlin, 1887).

To no artist of any epoch have so many works been devoted as to Michelangelo. Among the more important modern biographies are those of Duppa and Quatremère de Quincy, *Lives and Works of Michael Angelo and Raphael* (London, 1856); J. S. Harford (London, 1857); H. F. Grimm, *Leben Michaelangelos* (Hanover, 1860; 10th ed., Berlin, 1901; Eng. trans. by F. E. Bunnett, new ed., 2 vols., Boston, 1896); also Charles Clement (Paris, 1860; trans. in "Great Artist Series"); Aurelio Gotti (Florence, 1875); C. C. Black (London, 1875); C. H. Wilson (London, 1876); Perkins (Boston, 1878); A. H. Springer (Leipzig, 1892); Scheffler (Altenburg, 1892); J. A. Symonds (London, 1892; 3d ed., 2 vols., ib., 1899); Knackfuss (Bielefeld, 1895); Karl Justi (Leipzig, 1900), an able and scholarly work, to which his *Michelangelo, kritische Untersuchungen* (2 vols., ib., 1908) forms a valuable appendix; Ricci (Florence, 1901); R. S. Gower (London, 1903); Charles Holroyd (ib., 1903); Fritz Knapp, in the "Meisterwerke der Kunst Series" (Stuttgart, 1906); Hans Mackowsky (Berlin, 1908); Romain Rolland (Eng. trans., London, 1912), a romantic effusion; A. Gottschewski (Stuttgart, 1913). The first critical work was that of Grimm, in which the artist is sympathetically treated and with high literary skill. Although as much space is devoted to his time and environment as to the artist himself, it remains an admirable work for the general reader. Of value for the artist's youthful period is H. Wölfflin, *Die Jugendwerke Michelangelos* (Berlin, 1887). W. R. Valentiner, *The Late Years of Michelangelo* (New York, 1914), is a good, though brief, critical appreciation. A. H. Springer, *Raffaël und Michelangelo* (Leipzig, 1892), is a work of sound learning and criticism; also "Youth of Michael Angelo," from Vasari's *Lives*, in *Old South Leaflets, Annual Series*, vol. ix, no. 7 (Boston, 1891); *Masters in Art*, vol. ii (ib., 1901), containing an exhaustive bibliography; John La Farge, *Great Masters* (New York, 1903); G. B. Rose, *Renaissance Masters* (3d ed., ib., 1908); J. A. Gobineau, *Renaissance* (ib., 1913); F. P. Stearns, *Midsummer of Italian Art* (Boston, 1914). The most complete English life, of high literary and historical value, is that of J. A. Symonds. Henry Thode, *Michelangelo und das Ende der Renaissance* (3 vols., Berlin, 1902-12), gives an exhaustive treatment from the psychological standpoint. The latest extensive biography, Karl Frey, *Michelagnoli Buonarroti* (Berlin,

1907 et seq.), is a monument of scholarship and painstaking research, from the historical rather than the art critical point of view. Michelangelo's drawings have been ably treated in Bernhard Berenson, *The Drawings of the Florentine Painters*, vol. ii (New York, 1903), and published in facsimile with comments by Frey (800 plates, Berlin, 1907 et seq.).

Michelangelo's poems suffered much by being known through the garbled and mutilated edition of his grandson, Michelangelo the younger. A more complete edition was that of Guasti (Florence, 1863); but the best is by Frey (Berlin, 1897). The best English translation is by J. A. Symonds (3d ed., New York, 1912). Consult also: Wilhelm Lang, *Michelangelo als Dichter* (Stuttgart, 1861); Gabriel Thomas, *Michel Ange, poète* (Paris, 1892); and the admirable essay of Walter Pater, in his *The Renaissance: Studies in Art and Poetry* (New York, 1912).

MICHELET, mé'shlá', JULES (1798-1874). The greatest French historian of the Romantic school, born in Paris, Aug. 21, 1798, the son of a printer. He studied literature under Villemain (q.v.) and at 23 became professor of history in the Collège Rollin. He delivered lectures at the ancient Collège Sainte-Barbe and the Ecole Normale and, after the Liberal triumph in 1830, received an appointment at the Record Office, was made assistant of Guizot at the Sorbonne, and tutor of the Princess Clémentine. In 1838 he was made Academician and professor in the Collège de France, where he presently became involved in a bitter controversy with the Jesuits, the popular echoes of which may be felt in Sue's (q.v.) famous novel *Le juif errant*. In 1851 he refused the oath of allegiance to Napoleon, lost his offices, and lived mainly in Brittany and on the Riviera, giving himself wholly to literature, chiefly poetically romantic impressions of nature: *L'Oiseau* (1856); *L'Insecte* (1857); *La mer* (1861); *La montagne* (1868); of society, *L'Amour* (1858); *La femme* (1860); *La sorcière* (1862); *La bible de l'humanité* (1864); *Nos fils* (1869). From this imaginative and sociologic work he returned in his last years to history, adding 3 volumes (1872-75) to the 18 (1833-67) of his *Histoire de France* and bringing the narrative to Waterloo. Besides this monumental work he had contributed to history a *Précis d'histoire moderne* (1828); *Introduction à l'histoire universelle* (1831); *Origines du droit français* (1837); *Le procès des templiers* (1841-51); *Mémoires de Luther* (1845); and to religious and political controversy, *Les Jésuites* (in collaboration with Edgar Quinet, 1843); *Du prêtre et de la famille* (1845); *Du peuple* (1846). Characteristics of all Michelet's work are democratic enthusiasm, hatred of priests, sympathy for the oppressed, and a picturesque imagination that transformed vast learning into poetry and history into intuition. He is seldom an objective observer and rarely a dispassionate judge. Michelet's style, like his history, lacks continuity, it is striking rather than flowing, proceeds by leaps and bounds, appeals by rhythm as well as thought to emotion rather than reason. Michelet died at Hyères, Feb. 5, 1874. An edition of his *Works* in 40 volumes (1895 et seq.) is nearly completed. Besides the autobiographical *Ma jeunesse* (Paris, 1884) and *Mon journal* (ib., 1888), consult for his life: Jules Simon (Paris, 1886), F. Corréard (ib., 1886), J. Brunhes (ib.,

1898); Madame Quinet, *Cinquante ans d'amitié* (ib., 1900); Gabriel Monod, *Jules Michelet, études sur sa vie et ses œuvres, avec des fragments inédits* (ib., 1905); and for criticism: Taine, *Essais* (ib., 1855-56); Emile Faguet, *Politiques et moralistes du XIXe siècle* (ib., 1891); *Quarterly Review* (London, 1901).

MICHELET, mish'lä', KARL LUDWIG (1801-93). A German philosopher and follower of Hegel. He was born at Berlin and graduated at the University of Berlin. In 1829 he was appointed assistant professor of philosophy there. He published a large number of works on metaphysical subjects, including *Die Ethik des Aristoteles, etc.* (1827); *Das System der philosophischen Moral* (1828); *Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel* (1837-38); *Anthropologie und Psychologie* (1840); *Entwicklungsgeschichte der neuesten deutschen Philosophie* (1843); *Geschichte der Menschheit in ihrem Entwicklungsgang seit 1775* (1855-60); *Das System der Philosophie als exakter Wissenschaft* (1876-81); *Wahrheit aus meinem Leben* (1884), an autobiography; *Historisch-kritische Darstellung der dialektischen Methode Hegels* (1887), with S. H. Hering. From 1832 to 1842 he assisted in publishing the works of Hegel, whose best-known pupil he was, and from 1860 to 1873 he edited *Der Gedanke*.

MICHELET, mé'shë-lä', SIMON TEMSTRUP (1863-). A Norwegian theologian, born at Trondhjem. He was educated in Christiania, where he secured the Crown Prince's gold medal, and from 1888 at German universities. In 1894 he attained the doctorate in theology, and in 1896 he was appointed professor of Old Testament theology in the University of Christiania as Caspari's successor. His lecture at the Religious-Scientific Congress in Stockholm (1897) attracted much attention. In 1898 he studied in England and Scotland. He lectured extensively, and wrote many essays on the Old Testament, published in *Luthersk Kirketidende*, *For Kirke og Kultur*, and *Norsk theologisk Tidsskrift*, of which last he was coeditor after 1900. He wrote also *Det gamle Testaments Syn paa Synden* (1899); *Gamle Helligdomme i nyt Lys* (1902); *Det gamle Testaments Betydning for os*.

MICH'ELIN'IA. A fossil coral. See FAVOSITES.

MICHELL, mich'el, JOHN (1724-93). An English physicist and astronomer. He graduated at Queens' College, Cambridge, in 1748, became a fellow there the next year, and in 1762 was appointed professor of geology in the university. He invented the torsion balance, with the aid of which Cavendish later determined the mean density of the earth, and devised an "easy and expeditious method" of making magnets, described in a *Treatise of Artificial Magnets* (1750). He rendered important services to astronomy through numerous original contributions, including his *Enquiry into the Probable Parallax and Magnitude of the Fixed Stars from the Quantity of Light which they Afford us* (1767).

MICHELL, JOHN HENRY (?-). An Australian mathematician. He was a fellow of Trinity College, Cambridge, and later became assistant professor of mathematics at the University of Melbourne. In 1902 he was elected a fellow of the Royal Society. Michell became known for his researches in mathematical physics. His publications include: "Theory of

Free Stream Lines," in the *Philosophical Transactions* (1890); "The Wave-Resistance of a Ship," in the *Philosophical Magazine* (1898); "The Stress in the Web of a Plate Girder," in the *Quarterly Journal of Mathematics* (1900); "The Direct Determination of Stress in an Elastic Solid," in the *Mathematical Society Proceedings*; and other papers in the same publications and in the *Messenger of Mathematics*.

MICHELOZZO, mé'kë-lôt'sô, MICHELOZZI (1396-1472). One of the foremost Florentine architects of the early Renaissance, also a sculptor and goldsmith. Michelozzo was born at Florence, the son of Bartolommeo, a Burgundian tailor, who was made a citizen of Florence in 1376. His name is a variation of Michele. He was brought up as a die cutter and goldsmith and assisted Ghiberti on the doors of the baptistery. At an early period he appears to have come under the influence of Brunelleschi, and in 1425 he entered into an association with Donatello (q.v.), which lasted until about 1435. There is little independent sculpture which can be definitely ascribed to Michelozzo, but he probably had a greater part in Donatello's and Luca della Robbia's work than has been credited to him. The bas-reliefs of the Aragazzi Monument in the cathedral of Montepulciano, the silver figure of John the Baptist in the Opera del Duomo, Florence, a terra-cotta statue of the Baptist in the court of the church of the Annunziata, Florence, and a bronze statue of the same in the Bargello, Florence, are the best known of his independent works. They are classic in motive, dignified, and well proportioned, but lacking in imagination and freedom and realism of treatment. His principal importance is in architecture, to which he devoted himself from about 1435, and in this art he ranks second only to Brunelleschi in the annals of the early Renaissance. His style is classic, with reminiscences of the Gothic, and is distinguished by great simplicity of decoration. As preferred artistic adviser and court architect to Cosimo de' Medici, he secured wide and important commissions. In 1446 he succeeded Brunelleschi as superintendent of the Florentine cathedral, but appears to have done very little on that building. In 1437 he built the chapel of the Medici in Santa Croce, Florence, and between 1437 and 1452 superintended the construction of the monastery of San Marco in Florence. The library and the two courts, where the Ionic order appears for the first time in the Renaissance, are especially interesting. From 1444 to 1455 he was chief architect of the monastery of the Annunziata in Florence, and in 1447 constructed the tabernacle of the Holy Cross in San Miniato, Florence. In 1457 he went to Milan to rebuild the fine palace presented by Francesco Sforza to Cosimo de' Medici, the so-called Medici Bank. Of his work in this city only the chapel of the Portinari, on the exterior of Sant' Eustorgio, survives.

His most famous work, however, is the Riccardi Palace in Florence, built for the Medici, and probably begun about 1440. The Riccardi Palace, which is perhaps the finest city house in existence, is really only a development of the typical Florentine palace of the Middle Ages under the refining influence of classical ideals. The last of Michelozzo's larger undertakings, his work upon the Palazzo Vecchio in Florence, was begun in 1454. His last recorded work is the Palazzo Rettorale at Ragusa in Dalmatia

(1464). Consult: Geymüller, *Jahrbuch der königlich preussischen Sammlungen*, vol. xv; Fabriczy, ib., vol. xxv (1904); Fritz Wolff, *Michelozzo di Bartolommeo* (Strassburg, 1900); Wilhelm Bode, *Florentiner Bildhauer* (Berlin, 1910).

MICHELS, mik'els, ROBERT (1876-). A German sociologist, born in Cologne and educated at the universities of Paris, Munich, Leipzig, and Halle. He lived in Italy for two years before becoming docent at the University of Brussels (1905), and in 1907 became a teacher (later professor) of economics at the University of Turin. He was appointed professor of economics and statistics at the University of Basel in 1913. His works, in Hungarian, German, Dutch, French, and Italian, are particularly important in so far as they deal with Italy. Among them the following may be mentioned: *Brautstandsmoral* (1903); *Ethik und Patriotismus* (1906); *Borghesia e proletariato nel movimento socialista italiano* (1907; in German, 1906); *Storia del Marxismo in Italia* (1908); *Zur Soziologie des Parteiwesens* (1910; also in French and Italian); *Sexual Ethics* (1914; in German, 1911; in Italian, 1912; in French, 1913); *Saggi economici sulle classe popolari* (1914); *Probleme der Sozialphilosophie* (1914); and, in part, *Grundriss der Sozialökonomik* (1914).

MICHELSEN, me'kæl-sën, PETER CHRISTIAN HERSLEB KJERSCHOW (1857-). A Norwegian statesman, born at Bergen. He became prominent as a lawyer and shipowner, was elected to the Storting in 1891, and from the radical Left passed over in 1903 to the coalition of conservatives and liberals which was in favor of an amicable settlement of the consular representation dispute with Sweden. In October he entered the Hagerup ministry, representative of that party, first as member of the State Council at Stockholm and later as Minister of Finance. Upon the resignation of Hagerup in March, 1905, Michelsen formed a new cabinet, and with the unanimous support of the Storting entered on a course of rapid action which culminated in the dissolution of the union with Sweden. (For details, see NORWAY.) Michelsen was instrumental in the election of Prince Charles of Denmark (Haakon VII) as King, and by the new monarch was appointed first Premier of independent Norway in November, 1905, which position he held until his resignation in October, 1907.

MICHELSON, mi'kel-son, ALBERT ABRAHAM (1851-). An American physicist, born in Strelno, Germany, and brought up in San Francisco. He graduated from Annapolis in 1873, and after several years' service in the navy went abroad and studied at Berlin, Heidelberg, and Paris (1880-82). On his return to America, Michelson was professor of physics at the Case School of Applied Science, Cleveland, Ohio (1883-89), then held a like chair in Clark University (1889-92), and in 1892 became head of the department of physics in the University of Chicago. His determinations of the velocity of light were marked by a high degree of accuracy. These experiments were begun in 1878, when Michelson was at the Naval Academy, and were concluded in 1882. His invention in 1887 of an interferential refractometer enabled him to determine linear distances in terms of the wave length of light, and he was invited by the International Bureau of Weights and Measures at

Paris to ascertain the length of the standard meter in terms of the wave length of cadmium light. This investigation, carried on at the laboratories of the Bureau at Sèvres, was of great importance in that it enabled the International Prototype Meter to be reproduced at any time by reference to certain known quantities which are not only constant, but also are readily reproducible. In connection with Professor Morley, Michelson carried on a series of elaborate experiments designed to show the relative motion of matter and ether. He also devised the echelon spectroscope, by which he was able to secure greater dispersion than with a prism, and thus was able to study the Zeeman effect and other phenomena. His interferometer as applied to astronomy in connection with the telescope was found useful in resolving the light from the stars. A new and more efficient dividing engine for the construction of diffraction gratings for use in spectroscopy also represented a notable achievement by Professor Michelson. In 1897 he was a member, for the United States, of the International Committee of Weights and Measures and in 1902-03 a member of the Bureau International des Poids et Mesures. He was elected to the National Academy of Sciences and to numerous foreign societies, and became president of the American Physical Society (1901-02) and of the American Association for the Advancement of Science (1910). He received various prizes and medals, including a grand prize at the Paris Exposition of 1900, the Copley medal of the Royal Society of London in 1907, and also in 1907 the Nobel prize for physics. In addition to honorary degrees from many American universities he received an honorary D.Sc. from Cambridge in 1899 and a Ph.D. from Göttingen in 1911. He published *Light Waves and their Uses* (1903), a notable course of lectures delivered at Lowell Institute, Boston, in 1899.

MICHETTI, mè-kët'tè, FRANCESCO PAOLO (1851-). An Italian genre painter, born at Tocco da Casauria in the Abruzzi. He studied under Morelli (q.v.) at the Naples Academy and identified himself with the modern realistic school of Italian painters. His works are genre subjects of peasant life in southern Italy, painted with a rich, dazzling color, dramatic insight, and versatility of style, but at times they are erotic and morbid. His "Corpus Domini" (1877), "Palm Sunday" (1879), "The Shepherdess of the Abruzzi" (Modern Gallery, Rome), "Peasant Girl" (Pennsylvania Academy), and above all "The Vow" (1883, Modern Gallery, Rome) are good examples of this school of Italian art.

MICHIE, mik'ī, PETER SMITH (1839-1901). An American military engineer and writer. He was born in Brechin, Scotland, came to the United States in 1843, and was brought up in Cincinnati. He graduated second in the class of 1863 at West Point and entered the Engineer Corps; served in the campaign of 1864 against Richmond; was chief engineer of the Army of the James (1865); and was at the head of all engineering operations of the left column at Hatcher's Run and in the pursuit of Lee's army. After the war, having attained brevet rank of brigadier in 1865, he was for a year engaged in the government survey of the theatre of the war; from 1867 to 1869 he taught various branches at West Point; was member of a coastal fortification commission which visited

Europe in 1870; and for the last 30 years of his life was professor of natural and experimental philosophy at West Point. He wrote: *Elements of Wave Motion Relating to Sound and Light* (1882; 2d ed., 1891); *Life and Letters of Emory Upton* (1885); *The Personnel of the Seacoast Defense* (1887); *Elements of Analytical Mechanics* (1887); *Hydromechanics* (1888); *Practical Astronomy* (1891; 2d ed., 1893), with F. S. Harlow; *General McClellan*, in the "Great Commanders Series" (New York, 1901).

MICHIELS, mē'shē'el', JOSEPH ALFRED XAVIER (1813-92). A French historian and writer on art and literature, born in Rome of Dutch-Burgundian parents. After studying law at Strassburg (1834) he made his home in Paris, where he devoted himself to the study of art and history. His writings, which display exact historical knowledge, critical ability, and careful research, include: *Etudes sur l'Allemagne* (1830; new ed., 1850); *Angleterre* (1844); *Histoire de la peinture flamande et hollandaise* (1845; new ed., enlarged, 1865-76) and its sequel, *L'Art flamand dans l'est et le midi de la France* (1877); *L'Architecture et la peinture en Europe depuis le Ve au XVIe siècle* (3d ed., 1873); *Rubens et l'école d'Anvers* (4th ed., 1877); *Histoire secrète du gouvernement autrichien* (4th ed., 1879); *Van Dyck et ses élèves* (1882).

MICHIGAN, mish'i-gan (Algonquin *michi*, great + *guma*, water), is one of the north-central States of the United States of America. Its area includes two large peninsulas, a northern and a southern peninsula, and several islands. Mackinac Island is one of the most historic areas in America. The international boundary line between the United States and the Dominion of Canada forms the eastern and most of the northern boundaries of the State. Ohio and Indiana lie to the south and Lake Michigan to the west of the southern peninsula. Wisconsin is south of the western part of the northern peninsula. The length and width of the northern peninsula are 318 miles and 164 miles respectively; of the southern peninsula, 277 miles and 195 miles respectively. The latitude extent is from 41° 44' N. to 47° 30' N. (Isle Royal is crossed midway by the forty-eighth parallel.) The longitude extent is from 82° 35' W. to 90° 31' W. Area, 57,980 square miles, including 500 square miles of inland waters, but not including the water surface of the Great Lakes within the State boundaries. Michigan ranks twenty-second in area among the States.

Topography. The northern peninsula is divided naturally into two provinces, one of considerable relief to the west of the meridian of Marquette and one of low relief to the east. The western part of the northern peninsula consists for the most part of a table-land 1600 to 1800 feet above the sea, or 1000 to 1200 feet above the level of Lake Superior (602 feet in altitude). Above this table-land rise many rocky knobs and ridges, some locally termed mountains, varying in height from 200 to 300 feet. Porcupine Mountains in the western part of Ontonagon County, on the border of Lake Superior, reach an altitude of 2000 to 2100 feet. These mountains are the highest and most conspicuous physiographic feature of the State. The eastern part of the northern peninsula is in general much lower in elevation and has less relief than the western. Much of the surface is ancient lake bottom. In the south and in the northwest

there are low table-lands. The table-land in the south is of limestone (Niagara limestone), analogous in origin and topographic features to the Niagara escarpment in western New York. The table-land in the northwest, in Alger County and eastern Marquette County, is of sandstone. The north clifflike face, in places rising 100 to 200 feet sheer from the water surface of Lake Superior, and colored in shades of red, brown, and gray, and weathered and eroded into fantastic forms, constitutes the famous "pictured rocks" of Lake Superior.

The average altitude of the southern peninsula is estimated at about 850 feet, or 270 feet above the level of lakes Huron and Michigan (581 feet in altitude). The northern portion of the southern peninsula is occupied for the most part by a broad table-land bordered by gentle slopes. The surface of this table-land is from 1000 to 1200 feet above sea level. The highest point in the southern peninsula is a few miles southeast of Cadillac. Here two hills have altitudes of more than 1700 feet. A broad ridge of land in southeast Michigan extends from the southern boundary of the State in Hillsdale County north-eastward as far as Sanilac County. Many square miles in this ridge are more than 1000 feet above the sea. The surface of this tract is very rough, hills and ridges alternating with lake-filled basins. The remainder of the surface of the southern peninsula has flat or rolling topography. Lake plains from 5 to 40 miles wide extend along the eastern border of the peninsula from Alpena southward to the Ohio boundary. Hills of sand (dunes) occupy a narrow belt along much of the west shore of the southern peninsula.

Hydrography. Michigan has no large rivers. Few of the rivers are navigable, except in their lower courses where the United States government has made improvements, by even small vessels. Many will furnish abundant water power when the power possibilities are fully developed. The numerous lakes and swamps and loose soil tend to give to the rivers a nearly continuous flow. Most of the drainage of the northern peninsula is tributary to Lake Michigan. The Menominee, Manistique, and Ontonagon rivers are the more important. The Menominee River has numerous power sites. One at White Rapids develops 8500 horse power from a 50-foot fall.

The drainage of the southern peninsula is about equally divided between east-flowing and west-flowing streams. The Saginaw basin (area 6250 square miles), the largest in the southern peninsula, is made up of several widely branching rivers. These rivers were an invaluable aid in concentrating the lumber industry in the Saginaw valley for so many years. Down them floated millions of feet of logs to the mills at Saginaw and Bay City. The United States government has spent more than \$1,000,000 in dredging the Saginaw River, as far up as Saginaw, to a depth suitable for lake vessels. Grand River (drainage area 5600 square miles) furnishes water power at several points along its course. The lower course from Grand Rapids to the lake has been improved by the United States government so that it is navigable for small steamers. About \$1,000,000 has been expended to provide a deep harbor at Grand Haven. The other important rivers are the St. Joseph, Kalamazoo, Muskegon, Manistee, Cheboygan, Thunder Bay, Au Sable, Huron, and Raisin. Most of

87° Longitude C West 86° from D Greenwich 85°

L.L. PORTER & CO. N.Y.

these rivers have been dredged for short distances in their lower courses to make them navigable for lake vessels, and hydroelectric plants have been located along most of them.

Geology. Michigan lies within the glaciated area of North America and for the most part the bed rock is deeply buried in glacial drift. The area of bed rock exposures (little or no drift) is less than 9 per cent of the area of the State. The bed rock of the State includes all the systems of Pre-Cambrian and nearly all the Paleozoic series.

Pre-Cambrian rocks in Michigan occur as bed rock only in the western part of the northern peninsula, west of the meridian of Marquette. These rocks—schists, gneisses, granites, conglomerates, and slates—and rich deposits of iron ore and copper have been folded and faulted and metamorphosed by pressure and igneous intrusions and extrusions, so that their structure is complex. They differ greatly in hardness. This has resulted in unequal weathering and degradation and, consequently, in a rugged topography. Much of this area is bare rock. Glacial drift partly fills the depressions.

Paleozoic rocks outcrop or underlie the glacial drift in the remainder of Michigan. These rocks are arranged like a pile of saucers in a series of diminishing sizes from bottom to top. Only the rims of the "saucers" are exposed at places. The oldest of the series, the Cambrian, underlies the surface deposits in the northern part of the northern peninsula from Sault Ste. Marie westward to Marquette, and gives rise to the rapids of the St. Mary's River and the sandstone table-land in Alger and Marquette counties. The youngest of the series (Pennsylvanian, containing coal seams) outcrops, or is reached by, wells and mine shafts, in a large area in the central part of the southern peninsula. The arrangement of the strata is such that gypsum is quarried or mined from the same formation at Alabaster, on Saginaw Bay, and at Grand Rapids. The same limestone is quarried at Alpena and Petoskey, and could be quarried in southeast Michigan but for the thick drift. The Paleozoic rocks in general are more easily eroded than the Pre-Cambrian. The location, shape, and size of lakes Michigan, Huron, and Erie, Green Bay and Georgian Bay, as well as some of the lowlands of the Lakes region, are undoubtedly due to differential erosion of the Ordovician, Silurian, and Devonian formations.

Climate. Michigan lies in the interior of the continent, partly in the cold temperate belt (with extreme winters and mild summers) and partly in the warm temperate belt (with cold winters and hot summers). Its position would naturally give it a high range of temperatures, daily, monthly, and annual; but owing to the tempering influence of the lake waters its climate for the most part is markedly insular. The climate is characterized by frequent changes of temperature, wind direction, and moisture conditions. The mean annual temperature for the State as a whole is 44° F. (48° F. for the southern counties of the State and 39° F. for the northern). The average summer maximum for the interior of the southern peninsula is 85° to 90° F.; for the lake shore counties, 80° to 85°. The extreme maximum temperature occasionally exceeds 100° F. Hot spells rarely last more than one or two days. The average winter minimum is about 0° F. for the northern peninsula and 10° F. for the southern peninsula.

At Marquette in the northern peninsula the average temperature for the coldest month, January, is 16° F.; for the warmest month, 65° F. Cheboygan has a February mean (coldest month) of 16° F., a July mean of 66° F. Detroit has a January mean of 25° F. and a July mean of 72° F.; Grand Haven, a January mean of 24° F. and a July mean of 69° F.

In the northern peninsula frosts may occur every month in the year, but summer frosts even in the interior are not severe. In general the growing season is from 90 to 120 days. The southern peninsula is free from frost on the average from May 1–15 to October 1–10—about 160 days in the southern counties and 130 days in the northern. The lakes tend to prolong the cold season and thus retard the early budding of fruit trees, check the occurrence of late frosts, and prolong the warm season into the autumn.

Michigan is well supplied with rain. The average precipitation is about 33 inches and is fairly evenly distributed over the State. About one-third of the rainfall comes in the growing season, May, June, and July. Snow covers the ground for five to six months on the average in the northern peninsula, about three to five in the southern peninsula.

Soils. The soils of Michigan are wholly glacial or fluvioglacial in origin, and wholly unlike the bed rock in chemical composition. Only in a few areas in the State has bed rock been incorporated in the overlying or near-by soil. In the southern peninsula the soils vary in thickness from a few inches to 700 or more feet; the average thickness is about 200 to 300 feet. According to Leverett 12 per cent of the southern peninsula is covered by swamp and lakes; about 56 per cent has a sandy or gravelly soil and 33 per cent clay soil. Much of the sandy areas has a subsoil of clay. In the southern part of the southern peninsula almost the entire area is in productive farms. Some counties in the northern half have less than 10 per cent of the area in farms, mainly because of thin and sandy soils. In the northern peninsula swamps and lakes cover 25 per cent of the area; about 30 per cent has sandy soil, 20 per cent clay soil, and 10 per cent thin soils. Thin soils and large areas of swamp and the short growing season explain in part the retarded agricultural development. At present in 12 of the 15 counties of the northern peninsula less than 10 per cent of the area is in farms.

Mining. In 1913 Michigan ranked eighth among the States in the value of its mineral production. It owes this prominence to its great wealth in two metals—copper and iron. In the production of iron ore it ranked second, being exceeded only by Minnesota; and in the production of copper fourth, being exceeded by Arizona, Montana, and Utah. The mining of copper in Michigan antedates the earliest visits of European explorers to the region. The production on a commercial scale, however, dates from 1845, since which time the State has been a steady producer and an important factor in the copper industry of the world. To the close of 1913 Michigan had produced 5,361,432,892 pounds of copper, or 28.43 per cent of the output from the United States since 1845. In total output it is second only to Montana. The mining of copper is limited to the Keweenaw or Lake Superior district. Previous to the perfection of the electrolytic process of refining,

"Lake" copper enjoyed the distinction of being the highest grade produced, and even to the present time it sells at a figure slightly higher than the copper from other districts. Although the copper district has been an active producer for 65 years, most of the older mines still have large reserves of ore and new mines are being opened, while much of the territory remains to be prospected. The Lake Superior region is unique in being the only district from which a large output is derived from native copper. (See *Geology*, above.) The native copper occurs in the lodes in masses varying from microscopic size to bodies weighing hundreds of tons. The production of refined copper in Michigan in 1912 was 231,112,228 pounds. In 1913 the production was 155,853,409 pounds, valued at \$21,057,278. The great decrease in the output was due to labor troubles. The iron ores of Michigan, as of the other two States included in the Lake Superior region (Minnesota and Wisconsin), are hematites of Bessemer grade. In 1882 the Marquette and Menominee ranges were the only ones opened in the Lake Superior region. The production in the region in that year was a little short of 3,000,000 long tons, most of which was from Michigan. The Gogebic range was opened in 1884, as was also the Vermilion range, in Minnesota. The Mesabi range, in Minnesota, now the greatest iron producer in the world, was opened in 1892, but Michigan continued to lead in the production of iron ore until the first year of the twentieth century. The production of iron ore in the State in 1913 was 12,668,560 long tons, valued at \$33,479,954.

The coal fields occupy an isolated area in the lower peninsula. It is only since about 1900 that these mines have been developed to a considerable extent, and whatever importance this industry has obtained is due to the decline of the lumber industry. In earlier years the refuse of the lumber mills furnished the principal fuel for the salt works, but the exhaustion of the forests and the decline of the lumber industry has created a demand for coal to supply the salt works and for the other manufacturing plants. The maximum production of coal was in 1907, when 2,035,858 tons were produced. The production in 1913 was 1,231,786 short tons, valued at \$2,455,427.

Michigan ranks among the most important States in the manufacture of cement, which is third in importance among the State's industries. There were produced 4,081,281 barrels in 1913, valued at \$4,228,879. In the value of the salt production Michigan and New York have for many years alternated as first in rank. In 1913 Michigan held first place. The salt production (exclusive of rock salt) amounted to 10,829,307 barrels, valued at \$3,054,532 in 1913. At the time when salt making was subsidiary to the lumber industry the plants were largely located along the lake shore in Bay and Saginaw counties.

The principal clay products are common brick and drain tile. The value of the clay products was \$2,674,125 in 1913. The mining and calcining of gypsum is an industry of considerable importance. There are produced also important quantities of sand and gravel. The principal quarry product is limestone, the value of which in 1913 was \$1,408,708. Other commercial mineral products are occasional gems, lime, manganiferous ore, mineral paints, mineral waters, natural gas, petroleum, quartz, scythe-

stones, and silver. The total value of the mineral products in 1913 was \$72,143,211.

Agriculture. The soils of the south central and southwestern part are well suited to the production of corn, winter wheat, oats, and grass, while in the vicinity of the lakes much soil is especially suited to the production of sugar beets. In the northern part of the lower peninsula, and in a limited portion of the upper peninsula, are soils well suited to the production of Irish potatoes, buckwheat, rye, and clover. On the drained swamp lands that lie along the margins of lakes and rivers are many acres used for growing sugar beets, celery, onions, and cabbages.

The total number of farms in 1910 was 206,960. Of an approximate land area of 36,787,200 acres, the land in farms in 1910 was 18,940,614 acres. The improved land in farms in 1910 was 12,832,078 acres. The average acreage per farm was 91.5 in 1910. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry and bees, was, in 1910, \$1,088,858,379. The average value of all property per farm was \$5261 in 1910. Of the total number of all farms (206,960) in 1910, 174,271 were operated by owners and managers. In 1910 more than one-third of all Michigan farms were between 50 and 99 acres in size.

The native white farmers in 1910 numbered 147,790, the foreign-born white farmers 58,224, and the negro and other nonwhites 946. Of the foreign-born white farmers the greatest number were born in Canada.

The table below shows the acreage, value, and production of the principal crops in 1914. The figures are estimates of the United States Department of Agriculture.

PRODUCTS	Acreage	Prod. bu.	Value
Corn.....	1,750,000	63,000,000	\$42,210,000
Wheat.....	879,000	17,316,000	17,835,000
Oats.....	1,515,000	50,752,000	22,838,000
Barley.....	90,000	2,340,000	1,521,000
Rye.....	371,000	5,936,000	5,402,000
Buckwheat....	57,000	1,054,000	748,000
Potatoes.....	364,000	44,044,000	13,213,000
Hay.....	2,352,000	*3,011,000	36,132,000

* Tons.

The total value of crops in 1909 was \$162,005,000, and the combined acreage of crops for which acreage was reported was 8,198,578, representing 63.9 per cent of the total improved land in farms. The general character of agriculture is indicated by the fact that more than two-fifths of the total value of crops in 1909 was contributed by the cereals, more than one-fifth by hay and forage, and one-tenth by potatoes and other vegetables. In 1909 hay and forage was the leading crop; its acreage amounted to 2,715,301 and the production to 3,632,930 tons. The acreage of corn in that year was 1,589,596 and its production 52,906,842 bushels. The other leading crops, oats, wheat, and rye, had acreages of 1,429,076, 802,137, and 419,020 and produced 43,869,502, 16,025,791, and 5,814,394 bushels respectively. Aside from the cereals and hay and forage, the two most important crops were beans and potatoes.

The manufacture of cereals into prepared foods, which in recent years has become one of the leading industries, has resulted in greatly

increased acreages of corn, wheat, and other cereals.

The total acreage of potatoes and other vegetables was, in 1909, 456,368 and their value was \$16,201,328. Excluding Irish potatoes and sweet potatoes and yams, the acreage of vegetables was 90,861 and their value was \$6,287,000. As noted in the first part of this section large areas of land in Michigan are especially adapted to the growing of sugar beets, and this has become one of the most important agricultural industries. In the acreage and production of sugar beets Michigan is second, being surpassed only by Colorado. In 1909 the acreage planted to sugar beets was 78,779. The product amounted to 707,639 tons, valued at \$4,014,123. The area planted to this product in 1913 was 107,965 acres, and the production 955,242 tons. There were, in 1913, 15 sugar-beet factories in operation. The refined sugar made from the raw product in that year amounted to 122,424 short tons.

Orchard fruits in large quantities are grown. The value of these products in 1909 was \$9,020,842. The most important of these fruits was apples, of which 12,332,296 bushels, valued at \$5,969,080, were grown. Large quantities of grapes are also grown. These in 1909 amounted to 120,695,997 pounds, valued at \$1,531,057. Of small fruits, the total value in 1909 was \$2,028,865, and of these 27,214,659 quarts were grown. The most important of these fruits is the strawberry. Michigan is one of the leading States in the growing of celery. Portions of its soil are particularly adapted to the growing of this vegetable. The State also produced the greater part of the peppermint and chicory grown in the United States.

Live Stock and Dairy Products. The growing of live stock has been superseded in importance by mining and the growing of fruits, vegetables, and other agricultural commodities. The total value of live stock of all kinds in 1910 was \$137,803,795, and of domestic animals, \$131,746,348. On Jan. 1, 1915, the estimated number of cattle other than milch cows was 707,000, valued at \$21,069,000; milch cows, 814,000, valued at \$49,247,000; horses, 673,000, valued at \$88,836,000; mules, 4000, valued at \$524,000; sheep, 2,033,000, valued at \$10,165,000; swine, 1,392,000, valued at \$15,173,000. Poultry of all kinds numbered in 1910 9,967,039, valued at \$5,610,958. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$26,727,538. The milk sold was 74,025,769 gallons, and the butter sold amounted to 30,010,783 pounds.

Fisheries. Owing to its favorable position on four of the Great Lakes, Michigan ranks first among the Great Lake States in the value of its fishery products. There are no statistics of this industry prior to 1890, but in general it shows signs of growing importance. In all there are at least 23 species of fish caught, but lake trout, whitefish, lake herring, suckers, and various pike perches constitute, in the order named, the most important products. There were, in 1908, 3472 persons and 97 vessels of 1407 aggregate tonnage engaged in fisheries. The capital invested was \$2,013,000. To the total value of products of \$1,473,000 Lake Michigan contributed, in 1908, \$661,000 and Lake Huron \$486,000.

Forest Products. The lumber and timber industry dates from 1834, when the first steam saw mill was built in the Saginaw valley. Its

growth thereafter was very rapid, and in 1840 there were 558 establishments reported, which employed an average of 2730 wage earners and turned out products valued at \$2,464,000. The industry was at first concentrated along the borders of the Grand, Saginaw, and Muskegon rivers and their tributaries, and at certain of the lake ports. In former years the greater portions of the forest were conifers, though hard woods were intermingled with those in the South. White pine was originally the most abundant variety of wood, but the forests of this wood have been greatly depleted and this has necessitated the utilization of other woods, of which the State has a considerable supply. In 1909 the combined output of soft wood formed only little over one-half of the total cut. Hemlock contributed over two-thirds, and white pine only about one-fourth of the soft wood, while small quantities of spruce, cedar, tamarack, and balsam fir were also reported. Maple was by far the most important of the hard woods, while beech, basswood, birch, elm, and oak constituted most of the remainder. In 1909 the State ranked first in the cut of maple and beech. The method of exploiting the forests of the State has in past years been extremely wasteful. In recent years, however, a sentiment in favor of the adoption of improved methods of forestry has arisen, and a commission has been created to secure better protection of the forests. The total cut of rough lumber in 1909 was 1,889,724 M feet. There were cut also 218,308 thousands of lath and 891,649 thousands of shingles. In addition to these figures, forest products valued at \$7,911,901 were produced on the farms of the State.

Manufactures. The growth of the manufacturing industries has been closely related to the development of the transportation facilities. Its advance dates from about 1825, when the Erie Canal was opened, affording connection with the eastern seaboard. Michigan's position on four of the Great Lakes, with the attendant facilities for water transportation, has been a great factor in establishing its position as one of the leading manufacturing States in the Union. There were, in 1910, 24 cities with a population of over 10,000. These, while containing but 37.1 per cent of the population, were credited with 88.5 per cent of the total value of its manufactures. The value of its manufactured products in 1849 amounted to \$11,169,000; by 1869 it had increased to \$118,395,000; and in 1909 it amounted to \$685,109,000. The early development of manufactures was due largely to the utilization of its extensive forests, while the growing markets afforded by the rapidly developing West, the advantageous situation of the State with respect to the markets of both the East and the West, and its important agricultural and mineral resources have also been influential factors in its later progress. The table on page 586 gives the most important figures relative to the 10 leading manufactures for 1909 and 1904, as reported by the Bureau of the Census.

There were, in 1909, 58 industries for which products valued at more than \$1,000,000 were reported. In addition to this there were 13 other industries with a product valued at this amount, which are not included in the table, because the operations of individual establishments would be disclosed if they were shown separately. Among such industries are the

smelting and refining of copper, which is among the leading industries. The manufacture of cash registers and calculating machines is another important industry for which separate statistics cannot be presented. This industry centres in Detroit and has developed almost entirely since 1904.

The manufacture of automobiles, including bodies and parts, is the most important single industry as measured by value of product. The manufacture of automobiles in Michigan on any considerable scale began in Detroit about the beginning of the twentieth century, although it had been carried on to a limited extent prior to that time. The industry developed rapidly, and by 1904 Michigan had become the leading State in the manufacture of automobiles, which posi-

While the supply of such woods has diminished of late, the quantity of high-grade lumber imported has increased largely, and the industry has maintained the impetus afforded by its early natural advantages and has continued to prosper. Other leading industries are printing and publishing, manufactures of tobacco, tanning and currying of leather, manufacturing of paper and wood pulp, manufacturing of brass and bronze products, the manufacture of patent medicines and compounds and druggists' preparations, the manufacture of chemicals, and the manufacture of carriages and wagons and materials. The great development of the paper and wood pulp industry has been due to the more extensive use of wood pulp in the manufacture of paper. Other industries in addition to those

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
All industries	1909	9,159	271,071	231,499	\$583,947	\$118,968	\$685,109	\$316,497
	1904	7,446	200,196	175,229	337,894	81,279	429,120	199,039
Automobiles, including bodies and parts	1909	113	28,098	25,444	52,926	15,491	96,651	42,769
	1904	33	2,953	2,735	4,347	1,268	7,997	4,554
Butter, cheese, and condensed milk	1909	435	1,740	1,073	3,434	554	14,287	1,910
	1904	371	1,301	875	1,888	432	8,209	1,182
Flour-mill and gristmill products	1909	520	2,623	1,530	11,147	806	34,861	5,505
	1904	405	2,353	1,508	7,654	767	26,512	3,098
Foundry and machine-shop products	1909	654	25,334	21,649	48,065	12,344	45,399	26,688
	1904	452	18,604	16,396	23,167	8,657	31,434	17,348
Furniture and refrigerators	1909	202	18,299	16,610	28,222	8,300	28,642	16,924
	1904	142	15,602	14,565	17,768	6,468	20,502	11,862
Leather, tanned, curried, and finished	1909	24	2,440	2,291	12,012	1,133	15,331	3,210
	1904	25	1,852	1,747	6,861	866	9,340	2,069
Lumber and timber products	1909	1,180	39,011	35,627	57,290	16,298	61,514	32,472
	1904	1,058	37,124	34,193	48,771	15,995	57,217	32,488
Paper and wood pulp	1909	32	4,581	4,327	15,754	2,142	13,922	4,897
	1904	30	3,221	3,052	8,398	1,306	7,341	2,760
Printing and publishing	1909	1,045	11,048	7,219	13,725	4,000	17,348	12,413
	1904	937	8,650	5,999	9,079	2,981	12,050	8,626
Tobacco manufactures	1909	729	9,242	7,876	6,837	3,076	16,179	8,971
	1904	706	7,619	6,428	4,147	2,467	11,864	7,017

tion it held in 1909. In the latter year the State contributed 38.8 per cent of the total value of products for this industry. In 1909 there were produced 64,800 machines of all kinds, valued at \$70,359,749, compared with 9125 machines, valued at \$6,552,804 in 1899. The increase in production has been great since 1909 and has increased each year. In Detroit are located several of the largest manufactures of automobiles and parts. Industries connected with lumber and timber products are second in value of products. (For a more detailed account of this industry see the paragraph *Forest Products*, above.) In 1909 Michigan was the second State in the Union in the manufacture of furniture and first in the manufacture of refrigerators alone. The importance of the industry is due largely to the abundant available supply of pine and hard wood suitable for such manufactures.

mentioned in which Michigan holds high rank are the manufacture of stoves and furnaces and of corsets, the salt industry, wood distillation, and the manufacture of fur goods, show cases, and wall plaster.

The total number of wage earners in the State in 1909 was 231,499, of whom 199,298 were males. The wage earners under 16 years of age numbered 2517, of whom 1521 were males. For nearly one-half of the wage earners employed in the industries of the State the hours of labor in 1909 were 60 a week.

There were two cities, Detroit and Grand Rapids, with a population of 100,000 and over, and these were the principal manufacturing cities. The average number of wage earners in Detroit in 1909 was 81,011, and the value of the manufactured products was \$252,992,123. The manufacture of automobiles is by far the most

important single industry of the city. In Grand Rapids there were, in 1910, 17,590 wage earners, and the value of manufactured products was \$42,230,675. By far the most important industry is the manufacture of furniture. It is, in fact, the recognized centre of the furniture industry in the United States. Flint, the third city in value of manufactured products in 1909, owes its advance to the development of the automobile industry. Battle Creek was fourth. Its chief product is the manufacture of cereal or "breakfast" food preparations, the output of which was valued at \$9,717,000 in 1909, out-ranking all other cities in the United States in this manufacture. Other cities, the value of whose product in 1909 was \$10,000,000 or over, were Saginaw, Kalamazoo, Lansing, Jackson, and Bay City. Further information relating to the manufacturing industries of these cities will be found under their separate titles in other portions of this work.

Transportation. The transportation facilities, both by rail and by water, are excellent. In 1909, with 9059 miles of railroad, Michigan was the sixth State in the length of its trackage. The mileage of single track on June 30, 1914, was 8898.89. The State borders on four of the Great Lakes, which furnish intrastate and interstate communication by water. Detroit, located on the main lines of several of the most important railroad systems connecting the Eastern States with the Middle West, and near the western end of Lake Erie, is particularly well situated as a commercial centre. The Great Lakes are connected by canals, and in addition a short canal connects the northern end of Lake Portage with Lake Superior. The New York Central and Hudson River system operated 1951 miles on June 30, 1914. The chief roads of this line in the State and their mileage on that date are the Michigan Central, 1199, and the Lake Shore and Michigan Southern, 587. The Grand Trunk system, of which the longest road in the State is the Grand Trunk Western (236 miles), operated 881 miles of main track. Other important roads with their mileage of single track were: Pere Marquette, 1820; Chicago and Northwestern, 520; Duluth, South Shore and Atlantic, 509; Grand Rapids and Indiana, 429; Detroit and Mackinac, 400; Ann Arbor, 295; Minneapolis, St. Paul, and Sault Ste. Marie, 248; Chicago, Milwaukee, and St. Paul, 245.

Banks. The Bank of Michigan, organized in Detroit in 1817, was the first in the Territory. It incurred large losses in the panic of 1837-38, and was placed in the hands of trustees for liquidation in 1842. In 1835, shortly before Michigan was admitted as a State, nine new banks were organized. The free banking law of 1837 was the first in the United States to put into practice the system of securing the circulation of banks by deposit of collaterals. It also provided for examination of banks by bank commissioners. The law was imperfectly administered, however, and, in 1839, 42 banks were in the hands of receivers, and more than a million dollars of bills became worthless. In 1844 the banking law was declared unconstitutional. The banking system of the State did not recover from this depression for many years, and the banking business was carried on mainly by brokers and private bankers. In 1857 a new banking law was adopted, similar to the law of New York. On Sept. 12, 1914, there were 100

national banks with a capital of \$17,069,730; surplus, \$9,052,193; cash, etc., \$2,993,101; loans, \$114,304,546, and deposits, \$140,851,238; 270 State banks with a capital of \$14,469,800; surplus, \$7,140,910; cash, \$14,032,151; loans, \$128,704,861, and deposits, \$160,520,674.

Government. The present constitution was adopted by a constitutional convention on Feb. 21, 1908, and was ratified by the electors on November 3 of the same year. The original constitution was adopted in 1835. The second constitution was framed and adopted in 1850, when many features, radical for the time, were introduced. Amendments to the constitution may be proposed in either branch of the Legislature. If agreed to by two-thirds of both houses, they are submitted to the people at the next election, and become part of the constitution if ratified by a majority of the electors qualified to vote for members of the Legislature. Under a constitutional amendment ratified in 1913, amendments may also be proposed by petitions of not less than 10 per cent of the qualified electors, filed with the Secretary of State at least four months before election. Another amendment, also ratified in 1913, provides that statute laws may be enacted by the initiative and referendum.

Legislative.—The legislative power is vested in a Senate and a House of Representatives. The Senate consists of 32 members, who are elected for two years and by single districts. The House of Representatives consists of not less than 64 nor more than 100 members. The apportionment acts since 1861 have all fixed the number at 100. Representatives are chosen for two years and by single districts. Every 10 years, beginning with 1913, the Legislature is required by law to rearrange the senatorial districts and apportion anew the representatives among the counties and districts according to the number of inhabitants. The election of Senators and Representatives is held on the Tuesday succeeding the first Monday of November of every second year, dating from 1910. The Legislature meets on the first Wednesday in January of every second year, dating from 1909.

Executive.—The executive officers are a Governor, Lieutenant Governor, Secretary of State, State Treasurer, Auditor General, and Attorney-General. They are elected at each general biennial election for a term of two years. The chief executive power is vested in the Governor. No person is eligible to office of Governor or Lieutenant-Governor who has not attained the age of 30 years and who has not been five years a citizen of the United States and a resident of the State two years next preceding his election. The Lieutenant Governor is president of the Senate, but has no vote. The Secretary of State, State Treasurer, and Superintendent of Public Instruction constitute a board of State auditors, with the duty of examining and adjusting all claims against the State not otherwise provided by general law. They also constitute a board of State canvassers to determine the results of all elections of State officers. The same officers act as a State board of escheats and a board of fund commissioners.

Judiciary.—The judicial powers are vested in a supreme court, circuit courts, probate courts, justices of the peace, and such other courts of civil and criminal jurisdiction inferior to the supreme court as the Legislature may establish.

The supreme court consists of one chief justice and seven associate justices. The State is divided into judicial districts, in each of which there is elected one circuit judge, unless the Legislature provides for more. They are elected on the first Monday in April, dating from 1911, and serve for six years. In each county organized for judicial purposes there is a probate court. In addition to the ordinary powers these courts have original jurisdiction in all cases of juvenile delinquents and dependents. Judges of probate are elected in the counties in which they reside and hold office for four years.

Suffrage and Elections.—All males 21 years old or over who have resided in the State six months, and in the township or ward 20 days prior to the day of election, and who are included in one or more of the following categories are entitled to vote: (1) citizens of the United States; (2) those who were residing in the State on June 24, 1835; (3) foreigners who have resided in the State and who have, two years and six months prior to Nov. 8, 1894, declared their intention of acquiring citizenship; (4) civilized Indians who are natives of the United States. There is a primary election law, amended in 1913. All nominations must be made on the last Tuesday in August. Party candidates for United States Senator are also nominated at the primaries, and there is a provision for a presidential preferential primary. (See *History*, below.) A constitutional amendment was ratified in April, 1913, which provides for the recall of all elective public officers excepting judges of the courts. Women have the right to vote for members of school boards, and, if taxpayers of legal age, on questions involving the direct expenditure of public money or the issue of bonds.

Local and Municipal Government.—Each organized county is a body corporate, with such powers as shall be established by law. Each county may have a board of jury commissioners to be appointed by the Governor if it so votes. A board of supervisors, consisting of one from each organized township, has general charge of the administration of counties. Cities have such representation in the board of supervisors of the counties in which they are situated as may be provided by law. No county may incur an indebtedness which shall increase its total debt beyond 3 per cent of its assessed valuation. Each organized township is a body corporate, with such powers and immunities as may be prescribed by law. Each city and village has power and authority to frame, adopt, or amend its charter, and, through its regularly constituted authority, to pass all laws and ordinances relating to its municipal concerns, subject to the constitution and general laws of the State. Cities or villages may acquire, own, and operate their public utilities.

Miscellaneous Constitutional and Statutory Provisions.—Corporations may be formed under general laws, but shall not be created, nor shall any rights or privileges or franchises be conferred upon them, by special act of the Legislature. No corporation shall be created for a longer period than 30 years except for municipal, railroad, insurance, canal, or cemetery purposes, or corporations organized without any capital stock for religious, benevolent, social, or fraternal purposes. The Legislature may establish courts of conciliation, with such duties and powers as may be prescribed by law. Minors

under 21 years of age may not be employed more than 60 hours in any one week, save in exceptional circumstances. There is an employers' liability law. Michigan is under county local option law and, under this, cities and towns vote annually for license or no-license. In 1909 a search and seizure law was enacted by the Legislature. The Legislature of 1913 passed a measure prohibiting the drinking of alcoholic liquors on trains other than dining cars, and prohibiting drunken men from riding on trains. The same Legislature passed what is known as the Pray Law. This prohibits the shipment of liquor designed for illegal purposes into dry territory, and is supplementary to the national Webb Law.

Finance. The first Legislature authorized in 1837 a loan of \$5,000,000, which was to be devoted to public improvements. Only a small portion of the bonds were sold direct and paid in full. About two-thirds of them were deposited by the United States Bank of Pennsylvania, which failed in 1841 after selling some of the bonds. The State became liable for interest on these bonds, for which it never received any payment. It could not meet the interest payment in 1842, and an adjustment was reached which amounted to a partial repudiation of the State debt. In 1861 the debt was \$2,316,328, which was increased during the war to \$3,880,399. This, in 1880, fell to \$905,150, and was decreased 10 years later to \$10,993. In 1905 this debt was entirely paid off. By the Constitution of 1908, the State may contract debts to meet deficits in revenue, but such debts shall not in the aggregate at any time exceed \$250,000. The funded debt on June 30, 1913, was \$6,896,212. It consisted solely of special debt obligations to public trust funds, which were derived from the sale of all lands given by the United States to the State for educational purposes. The State has used these moneys for the expenses of the government, and pays interest to the various funds for the use of the same. The floating debt on June 30, 1913, was \$192,880, which was composed of private trust funds in the form of various deposits. The total receipts for the fiscal year 1913 amounted to \$13,434,472, and the disbursements \$13,165,468. The balance at the beginning of the fiscal year was \$8,980,404, leaving a balance at the end of the year of \$9,249,408. The chief sources of revenue are the State tax, railroad tax, telephone and insurance taxes. The chief expenditures are for primary schools and educational and charitable institutions.

Militia. The organized militia consists of one brigade of infantry including the first, second, and third regiments, two troops of cavalry, a battalion, field artillery, a company of engineer corps, a company of signal troops, and companies of sanitary troops with a field hospital. The total strength of enlisted men in 1913 was 2551, the officers numbered 199. The males of militia age in the State in 1910 numbered 616,739.

Population. The population at various periods is as follows: 1810, 4762; 1830, 31,639; 1840, 212,267; 1850, 397,654; 1870, 1,184,059; 1890, 2,093,890; 1900, 2,420,982; 1910, 2,810,173. The est. pop. on July 1, 1914 was 2,976,030; 1920, 3,668,412. The State rose from twenty-seventh rank in 1830 to eighth in 1910. There were 48.9 persons to the square mile in 1910. The fertile prairie region of the south was the first portion settled, and the majority of the population is still

found in the southern half of the lower peninsula. The population, however, is steadily increasing in the more northern regions. The early settlers were largely from New England and New York, but a large German element made settlements about the middle of the nineteenth century. The nearness to Canada has resulted in a large Canadian element, greater than that of any other State except Massachusetts. The total white population in 1910 was 2,785,247. The native white population in 1910 was 1,224,841. The native whites of foreign or mixed parentage in 1910 numbered 964,882. The population in 1910 was divided by sexes into 1,454,534 males, and 1,355,639 females. The males of voting age in 1910 numbered 870,876. Detroit, the largest city, had in 1910 a population of 465,766. The estimated population of Detroit in 1914 was 537,650. Other large cities with their estimated populations in 1914 are as follows: Grand Rapids, 123,227; Saginaw, 52,988; Bay City, 47,047; Kalamazoo, 45,842; Flint, 49,546; Jackson, 34,097; Lansing, 37,512; Battle Creek, 28,122; Muskegon, 25,442; Ann Arbor, 14,948; Sault Ste. Marie, 13,499.

Education. Michigan has always been among the foremost States in the maintenance of high educational standards. The percentage of illiteracy in 1910 was only three and three-tenths per cent, and among the native white population it was only one per cent. The total number of illiterates in that year, of 10 years of age and upward, was 74,800. Of these 54,113 were foreign-born whites.

The total school population, ages 6 to 20 years, in 1910, was 796,887; of these 539,739 attended school in that year. The statistics of the State Superintendent of Public Instruction for the year ending June 30, 1913, show a school population in that year of 815,849 with a total enrollment of 572,201. The total number of teachers employed was 17,987. The average monthly salary of men teachers was \$79.07 and of women teachers \$52.03.

The Legislature in recent years has been particularly active in passing new educational measures and in the revision of old ones. The compulsory education law passed in 1905 was revised in 1911. It now includes the compulsory education of deaf and blind children. The Legislature of 1913 passed a measure governing the sale of text books in the State. It is estimated that approximately \$100,000 annually will be saved by the operation of this law. Teachers' institutes are held yearly and these have been an important factor in keeping teachers in touch with advanced movements along educational lines. The high schools have shown a remarkable growth. An effort has been made to adapt the courses of studies in these schools to the needs of the communities in which they are placed. Since the beginning of the county normal system in 1903-04 these schools have furnished for the State 5850 teachers.

The schools in general are in charge of the district boards, which are elected annually and which have the power to vote taxes for school purposes, except for the erection of schoolhouses or additions, purchase of sites, and the payment of tuition in excess of \$20 per year per pupil. The board of any school district which does not maintain a legal high school must on application pay up to \$20 a year for each qualified student to any high school in the State.

By means of the township unit system all the

various districts are united into one district with one board of five members to conduct all the schools of the township, instead of many boards. Towns with a population of 900 or over may be exempt from the unit system. A child-labor law passed in 1909 and amended in 1911 contains strict provisions in regard to the employment of children of school age. Special attention is given to the education of the backward and feeble-minded. Classes are conducted in Detroit, Grand Rapids, and elsewhere and at Lapeer a training school is carried on each summer for teachers of backward and mentally defective children.

The school districts may establish a vocational school or a gymnasium, and physical training must be taught in public schools in city school districts with a population greater than 10,000 and in all State normal schools.

The State normal schools include the Western State Normal School at Kalamazoo, the Northern State Normal School at Marquette, the Central State Normal School at Mount Pleasant, and the Michigan State Normal College at Ypsilanti.

The University of Michigan, at Ann Arbor, is a part of the educational system, as are also the Michigan Agricultural College, at East Lansing, and the Michigan School of Mines, at Houghton. The other colleges include Adrian College at Adrian, Albion College at Albion, Alma College at Alma, Hillsdale College at Hillsdale, Hope College at Holland, Kalamazoo College at Kalamazoo, and Olivet College at Olivet. These are all coeducational. The University of Detroit is a college for men only, under the auspices of the Roman Catholic church.

Charities and Corrections. The charitable and correctional institutions are under the control of the Board of Corrections and Charities. These institutions include Kalamazoo State Hospital, Pontiac State Hospital, Traverse City State Hospital, Newberry State Hospital, Ionia State Hospital, the Michigan Home for the Feeble-Minded and Epileptic at Lapeer, the State prisons at Jackson and Lansing, the Michigan Reformatory at Ionia, the Industrial School for Boys at Lansing, the State Industrial School for Girls at Adrian, the State Public School at Coldwater, the Michigan School for the Deaf at Flint, the Michigan School for the Blind at Lansing, the Michigan Employment Institution for the Blind at Saginaw, the Michigan Soldiers Home at Grand Rapids, the State Sanatorium at Howell, an additional State sanatorium for the care and treatment of persons afflicted with tuberculosis, and a farm colony for the care and treatment of epileptics. There are also under the care of the board juvenile courts, county agents for the care of the poor, maternity hospitals, and child caring and placing agencies. There is a uniform probation law passed in 1913. The medical and surgical treatment of dependent children is provided for, and provision is also made for the medical treatment of children of indigent parents. Dependent and neglected children are educated and cared for at the State Public School and in other institutions approved by the State Board of Corrections and Charities. The State has a parole law for inmates of jails and prisons.

Religion. The Methodist and the Roman Catholic churches are in the lead, followed in the order named by the Lutherans, Baptists, Presbyterians, Congregationalists, and Protestant Episcopalians.

History. Remains of ancient mines and mining implements have been found within the present limits of the State. The white discoverers and first settlers were French missionaries and fur traders, some of whom visited the site of Detroit as early as 1610. In 1641 French Jesuits found their way to the falls of the St. Mary. The first actual settlement by Europeans within the limits of the State was the mission at Sault Ste. Marie, founded by Father Marquette and others in 1668. Three years later Michilimackinac (now Mackinac Island) was established. In 1679 and 1686 forts were built at the mouth of the St. Joseph and at the outlet of Lake Huron, and in 1701 Antoine de la Mothe Cadillac founded Detroit. Through the entire period of French occupation the town dragged out a painful existence, though the centre of a considerable fur trade and a place of meeting for friendly Indian tribes. The territory, with other French possessions, fell into the hands of the English at the end of the French and Indian War. Detroit was occupied in 1763, but early in May of that year the Indians, loyal to the French, rose under Pontiac (q.v.), massacred the garrison at Mackinac Island, and besieged Detroit for about five months. The English showed no capacity for government and the country made no progress under their rule. By the Quebec Act of 1774 the territory became a part of Canada, and during the Revolution Detroit was the starting point for many Indian expeditions which laid waste the American frontier. By the Treaty of Paris in 1783 the region passed to the United States, although England did not at once relinquish possession. After 1784 the Indians of the Northwest, deeming themselves unjustly treated by the Americans, waged a bloody warfare against the western settlements till they were brought to terms by General Wayne in 1795. By the treaty of peace concluded in that year they ceded large tracts of land on the eastern shore of the southern peninsula of Michigan and in the north to the United States. It was not until June 11, 1796, that the United States took actual possession of Detroit, though the region was included within the boundaries of the Northwest Territory, so called, and amenable to the Ordinance of 1787. In 1800 Ohio was set off from the Northwest Territory, including the eastern portion of Michigan, but in 1802 the whole of the lower peninsula was annexed to the Territory of Indiana. Its southern boundary was a line drawn east from the southerly extreme of Lake Michigan to Lake Erie. At that time the white population of Michigan was about 4000, consisting for the most part of Canadian traders and *coureurs de bois*. On June 30, 1805, Michigan was set off as a separate Territory, with substantially its present limits, and Gen. William Hull was appointed Governor. During the War of 1812 the inhabitants were harassed by the British and Indians; Mackinac was captured by the British; Detroit was surrendered by Governor Hull (q.v.); and at Frenchtown, in 1813, a number of American prisoners of war were massacred by the Indians. (For military operations during the War of 1812, see UNITED STATES.) At different times after 1814 the Indians ceded large tracts of land, and by 1836 all the lower peninsula and part of the upper peninsula had been freed from Indian title. Surveys were made as early as 1816, and in 1818 a large tract of land was put on the market. In 1819 the Territory was

authorized to send a delegate to Congress, and in 1823 the system of rule by a Governor and three judges was replaced by that of a Governor and a council of nine, selected from 18 chosen by the people; in 1825 the council was increased to 13, and after 1827 the members were elected by popular vote. In 1835 a State constitution was adopted by a convention called for that purpose, but the admission of Michigan into the Union was delayed by a dispute with Ohio concerning the southern boundary. (See TOLEDO WAR.) There was danger that the dispute would lead to bloodshed, but in 1836 Congress agreed to admit Michigan upon condition that she should surrender her claim to the disputed territory and accept in lieu thereof a larger area in the upper peninsula. The first convention called to consider this proposal, Jan. 26, 1836, rejected it, but it was accepted by a second in December, 1836, and on Jan. 26, 1837, Michigan was admitted into the Union. Michigan has consistently supported the Republican party, except for three lapses—in 1882 and 1883, when the Democrats and Greenback party in fusion elected their candidate for Governor, and in 1890 when the Democrats alone carried the State.

The constitution was revised in 1908 and went into effect the following year. Michigan was a consistently Republican State from 1890 until the rise of the Progressive party in 1912 broke the Republican strength. In the presidential election of 1908 Taft received 335,580 votes compared with 175,771 for Bryan. Warner, the Republican candidate for Governor, was elected by a plurality of only about 10,000 votes. In 1910 a United States Senator was for the first time nominated at direct primaries. Charles E. Townsend defeated Julius C. Burrows for the nomination, and was elected by the Legislature in 1911. Chase S. Osborn, a Republican with strong Progressive leanings, was elected Governor in 1910. By 1912 the Progressive party had developed great strength. Governor Osborn was one of the seven governors who signed a letter urging Mr. Roosevelt to be a candidate for the nomination in that year. Roosevelt carried the State in the presidential election of 1912, receiving 219,012 votes compared with 154,244 for Taft and 150,751 for Wilson. The Democrats succeeded in electing their candidate for Governor, W. N. Ferris, but the remainder of the ticket was Republican. At the same election an amendment providing that amendments to the constitution could be made by the initiative and referendum without recourse to the Legislature and an amendment providing ways for the recall of all elective and public officials except judges were also passed.

Governor Ferris was reelected in 1914, defeating Mr. Osborn, who was a candidate for reelection. The Progressive vote showed a falling off from 214,584 in 1912 to 36,747 in 1914. The following have been governors of the State:

TERRITORIAL

William Hull.....	1805-13
Lewis Cass.....	1813-31
George B. Porter.....	1831-34

MICHIGAN, LAKE. The third largest freshwater lake in the world (the largest being Lake Superior) and the only one of the American Great Lakes which lies wholly within the United States. It is bounded on the north by Michigan, on the east by Michigan and Indiana, on the south by Indiana and Illinois, and on the west by Illinois, Wisconsin, and Michigan (Map: United States, J 2). It lies between lat. 41° 37' and 46° 5' N. and long. 84° 45' and 88° W.; is 320 miles long (north and south), with an average width of 65 miles; and has an area of 22,400 square miles. Its drainage basin includes 68,100 square miles. The lake's surface lies 581 feet above mean sea level, and its maximum depth is 858 feet. A true tidal variation of 3 inches has been recorded at Chicago.

Currents of from 4 to 10 miles a day set northward along the east shore towards the lake's outlet at Mackinac Strait, and heavy north or south winds affect its normal level, raising or lowering it at either extremity—sometimes sufficiently to interfere seriously with navigation. There is also considerable seasonal fluctuation, the highest level from this cause being reached in February and the lowest in July or August. The lake is connected with the Mississippi River (which may have been its ancient outlet) by means of the Chicago Drainage Canal (q.v.). Green Bay (about 100 miles long) on the west shore and Grand Traverse Bay (about 30 miles long) on the east shore are the principal indentations, besides which there are minor ones, such as Big Bay de Noc and Little Bay de Noc, just north of the entrance to Green Bay. This scarcity of harbors and shallowness of the water near the shores make navigation dangerous during the not infrequent heavy winds. An elaborate system of lighthouses,

lightships, foghorns, buoys, weather-report and storm-signal stations, established and maintained by the Federal government, lessens these perils. There are no islands except in the northern portion of the lake, where are Beaver Island (about 50 miles long), Washington Island (at the entrance to Green Bay), and North Manitou and South Manitou islands (west of Grand Traverse Bay). In the winter months the northern reaches of the lake are frozen over, but the solid ice stops well north of Milwaukee. Mackinac Strait is usually closed from about the end of the first week in January until about the middle of April.

Lake Michigan receives no large rivers; the most considerable streams which flow into it are the Menominee and the Fox (qq.v.), which empty into Green Bay, and the Manistee, Muskegon, and Kalamazoo (qq.v.), which are Michigan rivers. The lake has important fisheries, especially of lake trout and salmon, which are exported in large quantities, both fresh and canned. Along the north shore is some rugged highland country, with one peak which reaches an altitude of about 1400 feet above sea level, and much of the east shore is skirted by sand hills from 100 to 250 feet high. Elsewhere, and especially along or near the southern portion of the lake, is some of the most productive agricultural land in the United States; and these conditions make the lake an exceedingly important medium in a huge trade in all kinds of grains, fruits, live stock, lumber, etc., as well as various metals and minerals which are also found near by. Chicago and Milwaukee (qq.v.) are the principal cities on the lake. Consult: "Sailing Directions for Lake Michigan, Green Bay, and the Strait of Mackinac," United States Navy, Hydrographic Office, *Publication No. 108 B* (Washington, 1906); "Survey of Northern and Northwestern Lakes," United States Lake Survey Office, *Bulletin No. 117* (Detroit, 1907); *The Gulf and St. Lawrence River*, published by the United States Navy, Hydrographic Office (3d ed., Washington, 1908). See GREAT LAKES.

MICHIGAN, UNIVERSITY OF. A coeducational State institution at Ann Arbor, Mich., chartered in 1837. According to the terms of the charter, branches were established at various places to serve as preparatory schools of the university. These existed only a short time and were the forerunners of the State high schools, which are now in intimate relation with the university. The institution was opened in 1841, graduating its first class in 1845. It is intended primarily for the higher education of residents of the State, but receives students from all parts of the country on payment of a small tuition fee. The governing body is a board of regents, elected for terms of eight years. The university is organized in eight departments: College of Literature, Science, and the Arts; College of Engineering and Architecture (opened in 1853); Medical School (1850); Law School (1859); College of Pharmacy; the Homœopathic Medical School (1875); the College of Dental Surgery (1875); and the Graduate School (separated from the other departments in 1912). Each department has its special faculty, with representation in the University Senate, which considers questions of common interest. The degrees conferred are bachelor and master of arts, science, engineering, architecture, and law; civil, mechanical, electrical, chemical, and marine engineer; and doctor of philosophy, science, medi-

cine, public health, dental surgery, and dental science. The total attendance in 1913-14, including the Summer Session, was 6500, of whom 2614 were students in the College of Literature, Science, and the Arts, 1332 in engineering, 123 in architecture, 288 in medicine, 612 in law, 107 in pharmacy, 78 in homeopathic medicine, 286 in dentistry, and 298 in the Graduate School. The total attendance of women, exclusive of the Summer School, was 857. The university, up to 1914, had conferred degrees on 29,614 persons, of whom over 3500 were women. The university was a pioneer in coeducation, women having first been admitted in 1870. They now constitute about one-third of the College of Literature, Science, and the Arts and about one-sixth of the student body. Coeducation at the university has been uniformly successful. The libraries of the university, including a number of important collections, aggregate 350,000 volumes. The university museums contain collections illustrative of natural history, the industrial arts, chemistry, materia medica, anatomy, archaeology, ethnology, the fine arts, and history, including a very full Chinese exhibit sent by the Chinese government to the New Orleans Exposition and presented to the university in 1885. The Detroit Astronomical Observatory contains a meridian circle, mounted clocks, a 13-inch refracting telescope, and a reflecting telescope with a mirror $37\frac{3}{8}$ inches in diameter, together with a set of horizontal and vertical seismographs. A smaller observatory is used in the work of instruction. There are two hospitals connected with the university, and the State Psychopathic Hospital is located in Ann Arbor in charge of the university. The Waterman Gymnasium, for men, and the Barbour Gymnasium, for women, are free to all students, and physical training is required of all freshmen. The general supervision of athletic sports is vested in a board of control of 11 members, five chosen from the University Senate, three from the alumni, and three from the Students' Athletic Association. The university is a member of the Northern Oratorical League, which includes the universities of Chicago, Minnesota, and Wisconsin, the State University of Iowa, Northwestern, and Oberlin. It belongs to the Central Debating League, with the University of Chicago and Northwestern University. Entrance to the colleges of literature, science, and the arts, engineering and architecture, and pharmacy is based upon examination or upon certificates from accredited schools. Two years of collegiate work are required for admission to the medical and law schools, and one year for admission to the dental college. The university has two dormitories for women, but no commons. Among other developments the establishment of courses in forestry, in marine engineering, in highway and in conservation engineering, in aeronautics, in wireless telegraphy, and in public health is noteworthy. The faculty in 1914 numbered 553. The endowment of the university was \$940,284, and its gross income for 1913-14 was \$2,202,860. The total value of the college property was \$5,844,601, of which the grounds and buildings were valued at \$3,910,179. The president in 1915 was Harry B. Hutchins. Consult E. E. Slosson, *Great American Universities* (New York, 1910).

MICHIGAN CITY. A city in Laporte Co., Ind., 56 miles by rail east of Chicago, Ill., on Lake Michigan and on the Père Marquette,

the Lake Erie and Western, the Chicago, Indianapolis, and Louisville, and the Michigan Central railroads (Map: Indiana, D 1). It is the seat of the Northern Indiana State Prison and has a public library, a United States life-saving station, a public park on the lake front, and a soldiers' monument. There are good transportation facilities, to which are due the city's large commercial interests, the trade being principally in lumber, salt, and iron ore. The manufactures of railroad cars, chairs, hosiery and knit goods, lumber and products of lumber are important. The government, as provided by the charter of 1837 and numerous amendments thereto, is vested in a mayor, who holds office for four years, and a common council, which elects all administrative officials, excepting the statutory municipal officers, who are chosen by popular vote. The city owns and operates the water works. Michigan City was laid out in 1832, settled in the following year, and incorporated in 1837. Pop., 1900, 14,850; 1910, 19,027; 1914 (U. S. est.), 20,710; 1920, 19,457.

MICHIGAN COLLEGE OF MINES. A mining school at Houghton, Mich., established in 1885. There are nine college buildings, with a library of about 27,000 volumes. In 1913-14 there were 26 instructors and 138 students. Its financial support is derived from the State.

MICHIGAN HERRING. The cisco (q.v.).

MICHIGAN STATE AGRICULTURAL COLLEGE. A coeducational State institution at East Lansing, Mich., the oldest institution of its kind in the country. It was established in pursuance of a constitutional provision in 1855 and was opened in 1857. Its endowment consists of a fund of \$990,000 derived from the sale of part of the lands (235,673 acres) given by the general government through the Act of 1862. There are five courses—agricultural, engineering, forestry, veterinary science, and women's or home economics—which were attended in 1914-15 by 1907 students under a faculty of 130. The library contained 33,000 volumes. Farmers' institutes are carried on annually in each county of the State, the total attendance at these schools in 1913-14 being about 214,000. The income from the endowment fund, with other government grants and State appropriations, amounted in 1914 to \$358,000. In that year the buildings and grounds were valued at \$585,600. The president in 1915 was J. L. Snyder, LL.D., Ph.D.

MICHMASH, mik'māsh. The site of the camp of the Philistines in the war at the beginning of Saul's reign, connected with the notable exploit of Jonathan (q.v.) related in 1 Sam. xiv. It was a town of Benjamin, about 7 miles north of Jerusalem. Its importance arose from its position on one of the two main roads from Jerusalem northward, at a point where the road descends into a steep and rugged valley. Josephus (*Ant.*, vi, 6, 2) gives a detailed account of Jonathan's exploit, which tallies well with the features of the locality to-day. Men of Michmash returned with Zerubbabel (*Ezra* ii. 27; *Neh.* vii. 31). It is mentioned in the forecast of an Assyrian invasion in *Isa.* x. 28 et seq. In the time of the Hasmonæans it became the headquarters of Jonathan (1 Macc. ix. 73) and was a large village in the time of Eusebius. It is the modern Makhmas, a village of 400 inhabitants. Near it the Wadi el Suweinīt narrows into a ravine answering to the description of the passage of Michmash in 1 Sam. xiv. 4, 5, and the two "sharp rocks" have also been

identified. Consult Benzinger, in Baedeker's *Palestine and Syria* (5th ed., Leipzig, 1912).

MICHOCÁN, mē-chō'á-kán'. A Pacific coast state of Mexico, bounded by the states of Jalisco, Guanajuato, and Querétaro on the north, Mexico on the east, Guerrero and the Pacific Ocean on the south, and Colima and Jalisco on the west (Map: Mexico, H 8). Area, 22,617 square miles. The surface is generally mountainous, although its highest elevations are below 13,000 feet. It is divided by the Sierra Madre Occidental into a northern region, which forms a part of the great central plateau, and a southern one, consisting of fertile valleys and wooded ranges, sloping gradually to the Balsas River and the Pacific Ocean. The northern region is rather flat and interspersed with numerous lakes, of which the largest are Chalapa, partly in the State of Jalisco, Cuitzeo, and Pátzcuaro. With the exception of the large rivers Lerma and Las Balsas, forming part of the boundaries, and the Tepalcatepec, a tributary of Las Balsas, crossing the state from east to west, the rivers are small. The climate is on the whole healthful, except in the southern part, where fever prevails to some extent. The soil is of remarkable fertility; the principal products are cereals in the more elevated parts and sugar cane, coffee, vanilla, tobacco, and other tropical plants in the valleys. An abundance of fine timber is found in the southern valleys and on the Pacific slope. The mining industry is important; the principal metals are gold, silver, copper, and iron. The Dos Estrellas mine, producing gold and silver, is the richest in the Republic. Stock raising is carried on to a considerable extent, and there is some manufacturing. The state lacks railway facilities, having only three short branches of the National railways, in the northern part. Pop., 1900, 935,808; 1910, 991,880. Capital, Morelia (q.v.). Michocán was inhabited by the Tarascos, who had successfully resisted the domination of the Aztecs up to the time of the Conquest.

MICKIEWICZ, mits'ki-á'vich, ADAM (1798-1855). The greatest of Polish poets. He was born near Novogrodek, Lithuania; his father was a lawyer of the lesser nobility. Inclined to the study of nature, he took up mathematics and physics at the University of Vilna, which was at that time the centre of Polish national and intellectual life, but later passed to biology and literature (1815-19). After that he taught Latin and Polish at the Gymnasium in Kovno until 1823, publishing there the first collection of his poems in two volumes in 1822. To the legends, superstitions, and tales of the Polish nation contained in it Mickiewicz gave a wonderfully poetic form, and at one bound became the national poet of the Poles. The volumes contained two longer works, *Dziady* (Ancestors, Festival in Honor of the Dead), a romantic drama, and *Grażyna*, an historical epic. The former contains much autobiographical material. The poem is deficient in orderliness, the episodes being flung together with almost reckless freedom, but the chief theme—love—has, perhaps, never been better sung. *Grażyna* relates the noble death of a princess of that name, who dons the armor of her husband and thus disguised leads his army against the Teutonic Knights.

In 1824 Mickiewicz was arrested in Vilna on suspicion of revolutionary plotting and was sent to St. Petersburg. In the capital he formed a warm friendship with Pushkin, but soon went

to Odessa (1825) as instructor in the Richelieu Lyceum. After nine months he visited the Crimea, and this was a turning point in his career. *The Crimean Sonnets* recording his impressions are glowing with Oriental color and graceful in form. In December, 1825, he obtained a position in the office of the Governor-General, Prince Goltzin, at Moscow. In 1828 he returned to St. Petersburg, and there published his second epic, *Conrad Wallenrod*, descriptive of the struggle of the Lithuanians against the Teutonic Knights. In 1829 the poet received permission to travel in Italy, Germany, and France. In Rome he became acquainted with Lamennais and Montalembert. In Weimar he met Goethe, who became greatly interested in him. After staying for a time in Rome, where he met James Fenimore Cooper, he started for Poland on hearing of the uprising of 1830, but, unable to cross the strictly guarded frontier, he went to Dresden, after lingering in Posen for a while, and soon settled in Paris. There he published in 1832 the famous *Books of the Polish Nation and Polish Pilgrimage* and the third part of his *Dziady*. In poverty and distress, he published in 1834 his masterpiece, *Sir Thaddeus (Pan Tadeusz)*, a delightful portrayal of the life of Polish nobility at the beginning of the nineteenth century. In 1839 he was called to the chair of Latin literature at Lausanne and in the year following he was appointed the first incumbent of the newly founded chair of Slavic literatures at the Collège de France. But after a year or two, being influenced by one of his countrymen, Towianski, he began to intermingle his lectures with irrelevant discussions on politics, religion, and mysticism, and the French government was forced to stop his lectures in 1844. In 1848 he went to Italy and there undertook to form Polish regiments against Austria. Then, in 1849, he edited at Paris the *Tribune des Peuples*, which was soon stopped by the French government. In 1852 he was appointed a librarian in the Arsenal, and on the outbreak of the Crimean War Louis Napoleon sent him to Constantinople to organize Polish regiments against Russia. Here he died shortly afterward. He was buried in Paris; in 1890 his body was transferred to Cracow.

The best edition of Mickiewicz' works is that of 1838, in eight volumes, published in Paris, under the poet's personal supervision. The *Mélanges posthumes* were published in 1872-79 by his son Wladislaw, who also edited his father's *Correspondence* (1870-85). A critical edition of the poet's works was undertaken by the Mickiewicz Society (Lemberg, 1894 et seq.); the latest edition was prepared by Kallenbach (Cracow, 1911). They have been translated into most European languages. In French his *Chefs d'œuvre poétiques* appeared in 1882. His ballads and sonnets are to be found, in German, in Reclam's *Universal Bibliothek*; *Dziady* (Ahnenfeier), in German by Lipiner (Leipzig, 1887); *Grażyna*, in German by Nitschmann in *Iris* (ib., 1880); *Wallenrod*, by Weiss (Bremen, 1871); *Herr Thaddäus*, by Weiss (Leipzig, 1882) and Lipiner (ib., 1883). *Conrad Wallenrod* was translated into English by Leo Jablonski, and a poetical version of it by Cattle appeared in London in 1840. *Master Thaddeus* was rendered into English by Biggs (London, 1885). The best biography in French is by his son, Wladislaw Mickiewicz (Paris, 1888); revised and enlarged in Polish (Posen, 1890-94). In Polish there are, moreover, several biographies by

Chmielowski, Belcikowski, Kallenbach, and others; in Russian that of Pogodin (Moscow, 1912) is the latest. Consult M. M. Gardner, *Adam Mickiewicz, the National Poet of Poland* (New York, 1911).

MICKLE, mīk'ŭl, WILLIAM JULIUS (1735-88). A Scottish poet, born at Langholm, Dumfriesshire. Mickle failed as a brewer, settled in London as a writer, and became corrector to the Clarendon Press, Oxford (1765). In 1767 he published a narrative poem called *The Concubine*, reissued in 1778 as *Sir Martyn*. Excepting Thomson's *Castle of Indolence*, it is the best of the eighteenth-century imitations of Spenser's *Faerie Queene*. Retiring to a farm near Oxford, Mickle made a free version of the *Lusiad* of Camões (1775). To Evans's *Old Ballads* (1777-84) he contributed the fine ballad *Cumnor Hall*, which suggested Scott's *Kenilworth*. He may also have written the exquisite Scotch song *There's nae Luck about the Hoose* (ascribed also to Jean Adams). In 1779 Mickle went to Lisbon as secretary in the *Romney* man-of-war. He was most hospitably received and made a member of the Royal Academy of Portugal. He died at Forest Hill, not far from Oxford. Consult his *Poetical Works*, with biography, edited by Sim (London, 1807).

MIC'MAC. An important Algonquian tribe of Canada, occupying all of Nova Scotia, Cape Breton Island, and Prince Edward Island, with large portions of New Brunswick, Quebec, and Newfoundland. The name is of uncertain etymology. In all the colonial wars the Micmac sided with the French, those of southern Nova Scotia especially making a reputation by their inroads upon the New England settlements. They are now all civilized, fairly industrious as hunters, fishers, guides, and basket and curio makers, but without any appreciable desire to advance their condition; moral, sober, and law-abiding, and almost solidly Roman Catholic through the effort of early French missionaries and their successors. Their language and traditions have been investigated by the missionary Rand. Consult S. T. Rand, *Legends of the Micmacs* (New York, 1894).

MI'CON (Lat., from Gk. *Mikōn*, *Mikōn*). An Athenian painter and sculptor who flourished about the middle of the fifth century B.C., closely associated with Polygnotus (q.v.). He painted three of the walls of the Theseum, or Temple of Theseus, built by Cimon (not to be identified with the so-called temple of Theseus, still standing at Athens), and is said to have had a hand in the great picture of the battle of Marathon in the Stoa Poikile. He helped to decorate also the Anaceum, or Temple of the Dioscuri (Castor and Pollux), at Athens. (Consult E. A. Gardner, *Ancient Athens*, London, 1902, and C. H. Weller, *Athens and its Monuments*, New York, 1913.) He was especially skillful in the painting of horses.

MI'CROBE. A microscopic organism; especially applied to a bacterium. Various infectious diseases are caused by its presence. See BACTERIA.

MICROCEPH'ALUS. A condition in which the head is disproportionately small. The child is born with the skull completely ossified, or ossification takes place soon after birth. Normally the bones are separated by ununited sutures and by spaces called fontanelles, thus giving opportunity for expansion and growth of the brain. Microcephalics are generally deficient

mentally, and may be abnormal in other ways. The bones of the cranium may be artificially separated by a surgical operation known as linear craniotomy, which in a measure restores the natural spaces between the bones. See MONSTROSITY.

MICROCHIROPTERA BAT. See CHIROPTERA.

MI'CROCLINE (from Gk. *μικρός*, *mikros*, small + *κλίνειν*, *klinein*, to incline). A potassium-aluminum (see POTASSIUM) silicate that crystallizes in the triclinic system and is near orthoclase in its properties, being a member of the triclinic group of feldspars (see FELDSPAR). It has a vitreous lustre and is white to cream yellow in color, and sometimes red or green. The green varieties are known as Amazon stone and are occasionally cut for semiprecious stones. The ordinary microcline, which is found both as crystals and in masses in granitic rocks, is of common occurrence; excellent specimens are found at Magnet Cove, Ark.

MI'CROCOC'CI. See BACTERIA.

MI'CROCON'ODON (Neo-Lat., from Gk. *μικρός*, *mikros*, small + *κόνος*, *kōnos*, cone + *ὀδός*, *odous*, tooth). A small fossil jaw of uncertain affinities found in the Triassic rocks. It has been considered by some American authors to belong to a group of vertebrates intermediate in position between the highest anomodont reptiles, the Theromorpha, and the lowest polyprotodont mammals. Consult Osborn, "On the Structure and Classification of the Mesozoic Mammalia," in *Journal of the Philadelphia Academy of Natural Sciences* (Philadelphia, 1888).

MI'CROCOSM (Lat. *microcosmus*, Gk. *μικρόκοσμος*, *mikrokosmos*, little world, from *μικρός*, *mikros*, small + *κόσμος*, *kosmos*, world) and **MAC'ROCOSM** (from Gk. *μακρός*, *makros*, great + *κόσμος*, *kosmos*, world). The belief, current in ancient times, that the world or cosmos was animated, or had a soul, led to the notion that the parts and members of organic beings must have their counterparts in the members of the cosmos. The natural philosophers of the sixteenth century took up this notion anew in a somewhat modified shape, and considered the world as a human organism on the large scale and man as a world, or cosmos, in miniature; hence they called man a microcosm and the universe itself the macrocosm. With this was associated the belief that the vital movements of the microcosm exactly corresponded to those of the macrocosm, and this led to the further assumption that the movements of the stars exercised an influence on the temperament and fortunes of men.

MI'CROCOSMIC SALT, or SALT OF PHOSPHORUS. An ammonium-sodium-hydrogen phosphate, $\text{NH}_4\text{NaHPO}_4 \cdot 4\text{H}_2\text{O}$, that crystallizes in the monoclinic system and is found native as the mineral *stercorite*. It was known to the older chemists, who extracted it from human urine. It may be made by dissolving crystallized sodium phosphate and ammonium chloride in water, heating the solution to boiling, then filtering and cooling to crystallization. On heating, the crystals melt readily, giving up water of crystallization, and later ammonia, and leaving sodium phosphate, which melts and solidifies on cooling to a clear colorless glass. It is used chiefly as a flux in blowpipe analysis.

MI'CROCYN'CAS. A genus of cycads, one of the great groups of Gymnosperms, which is rep-

resented by a single species restricted to western Cuba.

MICRODISCUS (Neo-Lat., from Gk. μικρός, *mikros*, small + δίσκος, *diskos*, disk). A small Cambrian trilobite with body of oval outline, head and tail shields alike, and only three or four thoracic segments. Another name for the fossil is *Goniodiscus*. See *AGNOSTUS*; *CAMBRIAN SYSTEM*.

MICROFARAD. See *FARAD*.

MICROLESSES (Neo-Lat., from Gk. μικρός, *mikros*, small + λήσής, *lēstēs*, robber). A small fossil jaw with multituberculate teeth found in the Triassic rocks of Württemberg and England. This fossil has figured prominently in discussions on the origin of the mammalia, and it is usually placed among the prototherian mammals; but, as the skull to which it belongs is entirely unknown, its exact systematic position is undeterminable, and it may prove to be the jaw of an anomodont reptile (*Theromorpha*) instead of that of a mammal.

MICROMETER (from Gk. μικρός, *mikros*, small + μέτρον, *metron*, measure). Any device by means of which it is possible to make a linear

measurement more accurately by employing levers, screws, or magnifying glasses than by using a simple rule or scale. Figure 1 shows a simple form of lever micrometer adapted to the measurement of thicknesses, diameters, and the like. The movable lever *AB* turns on a pivot at *C*, and since the arm *CB* is five times as long as the arm *CA*, the pointer at the end of *B* will move over the scale *D* five times as far as the points are opened at *A*, and consequently the measurement is

FIG. 1. LEVER MICROMETER.

about five times as accurate as if a scale were applied directly. Figure 2 illustrates a form of simple screw micrometer. The screw has 10 threads to the inch, and consequently one complete revolution will remove the point of the screw *A* from the plate *C* one-tenth of an inch. The head *B* of the screw has its rim divided into 100 equal parts; hence a rotation of the screw through one of these parts means one one-hundredth of a complete revolution, and such a motion would remove the point from the plate by a distance of $\frac{1}{100}$ of $\frac{1}{10}$, or $\frac{1}{1000}$ inch. A very common form of screw micrometer, described and illustrated under *CALIPERS*, has 40 threads to the inch, and the head is divided into 25 parts, making the value of a scale division $\frac{1}{25}$ of $\frac{1}{40}$, or again $\frac{1}{1000}$ of an inch.

FIG. 2. SIMPLE BENCH MICROMETER.

In working with the telescope and the microscope it becomes necessary to make measurements upon the image formed by the objective, and for this purpose a micrometer ocular is employed. The simplest form of this device is a fine scale ruled upon glass in hundredths of an inch, or tenths of a millimeter, and so mounted in the draw tube that it will be seen distinctly by means of the eyepiece, and hence will be in the plane of the image formed by the objective. The scale appears to lie upon the object, and it is only necessary to read off the dimensions. A revolution of the draw tube makes measurements in different directions possible without moving the objective.

A more accurate and satisfactory micrometer ocular is that devised by Ramsden and illustrated in Fig. 3. *H* is the divided head of a micrometer screw *S* reading to a hundredth of

FIG. 3. MICROMETER OCULAR.

a screw revolution, $\frac{1}{100}$ millimeter, e.g., where the pitch of the screw is a half millimeter. The screw is so arranged that it will cause a rectangular frame *AA* to move backward and forward as the screw revolves. Across the middle of the frame *AA* are stretched two fine spider lines, at right angles to the axis of the screw and quite close together. The whole device is so attached to the draw tube of the microscope or telescope that the spider lines lie in the focal plane of the objective and hence are distinctly seen magnified by the ocular. In making measurements with this instrument the screw *S* is turned until the spider lines straddle one point, and then a reading is made of the position of the head *H*. Next the screw is again turned until the lines straddle the other point, another reading is made, and the difference of the two readings gives the distance between the points upon the image. By placing a known scale, e.g., a tenth of a millimeter, upon the stage of the microscope, and measuring the image as above, the magnifying power of the microscope objective is obtained, and it is possible to calculate what distance upon the stage or in the object corresponds to one revolution of the micrometer screw. The whole number of revolutions of the screw is sometimes read by means of a second wheel so geared to *H* that it makes one revolution for 20 or 30 revolutions of the screw *S*. In other cases a strip of metal with small teeth like saw teeth, and as far apart as the threads of the screw *S*, is placed across

the side of the opening so that the double spider line appears to move over it from tooth to tooth, each tooth corresponding to one complete revolution of the screw. Such micrometers are used in measuring objects under the microscope, in most accurate linear and angular determinations, and in telescopes for obtaining star distances, and for a great variety of measurements. A very elaborate and delicate micrometer attached to the eye end of the telescope and used in star work is called a position micrometer. A special form of micrometer is used for measuring the star distances on the photographic plates that are taken of star groups and clusters. See MICROSCOPE; TELESCOPE.

MICROMETER CALIPERS. See CALIPERS; MICROMETER.

MI'CRONE'SIA (Neo-Lat., from Gk. *μικρός*, *mikros*, small + *νῆσος*, *nēsos*, island). A name of Greek origin, meaning "small islands." It is used to designate that part of Oceanica which consists of the Ladrone and Caroline islands, Marshall Islands, the Gilbert group, and many others of small size. All of these lie northwest of Polynesia, north of Melanesia, and east of the Philippines, between long. 130° and 180° E. The group also forms an ethnological division of Oceanica. (See MICRONESIANS.) Politically they were apportioned to Great Britain, the United States, and Germany, but in the War of 1914 Germany's islands were seized by the allies.

MI'CRONE'SIANS. The inhabitants of Micronesia (q.v.). They belong undoubtedly to the Malayo-Polynesian race, although the authorities differ concerning their ethnic purity. Finsch, who had personal knowledge of most Oceanian tribes, unites Micronesians and Polynesians under a single head, attaching to their separation a purely geographical, not anthropological, meaning. The languages of Micronesia are Melanesian. The mass differ in type slightly from the Polynesians; they are more hairy, are shorter, and their heads are more elongated. Culturally the Micronesians have developed considerable individuality. Adzes are usually of shell, even where excellent stone material is available. Matting and plaitwork are highly developed, and the Caroline Islanders even weave on a loom. Bark cloth, while not lacking, is far less common than in Polynesia. Shells are very largely used as currency. The Marshall Islanders are skilled mariners and in former times they constructed stick charts to guide their navigations. For part of the Micronesians (e.g., those of Ponape and the Marshall group) an exogamous clan system with maternal descent has been established, and the kinship terminology is of the classificatory type and of the form originally called "Malayan" and now "Hawaiian." In the Gilbert Islands the warlike natives used very dangerous spears and daggers set with sharks' teeth and wore a protective armor of coconut-fibre cuirasses, jacket, and trousers.

tian, *The Caroline Islands* (London, 1899); id., "On Micronesian Weapons," in the *Journal of the Anthropological Institute* (ib., 1899); Krämer, *Hawaii, Ostmikronesien, Samoa* (Stuttgart, 1906); Erdland, *Die Marshall-Insulaner* (Münster, 1914). See POLYNESIANS.

MI'CROÖR'GANISM. See BACTERIA.

MI'CROPHONE. See TELEPHONE.

MI'CROPHOTOGRAPHY, or **PHOTOMICROGRAPHY.** The art of photographing minute objects, generally microscopic preparations of bacteria or tissue, for the purpose of making illustrations or projections upon the screen. The apparatus consists of a large-barreled compound microscope and a suitable camera having a long bellows which fits over the eyepiece of the microscope to exclude all light except that illuminating the object to be photographed. Both microscope and camera are fixed upon an immovable base, free from vibration. Sunlight or artificial light may be utilized, the latter being derived either from a paraffin lamp, incandescent gas, oxyhydrogen, acetylene, or electric light. There is also provided by certain microscope makers an elaborate illuminating system of condensers and lights such as is used in a projection apparatus. When dealing with fields under a low power of magnification and using a paraffin lamp the substage condenser may be dispensed with; under high powers of magnification a substage achromatic condenser is required. The whole field must be evenly illuminated and the flame image eliminated. This is done in various ways: with the paraffin lamp, e.g., the flame image is focused accurately in the centre of the field and the light rays are then broken up by interposing a bull's-eye condenser. When using the oxyhydrogen light the lantern is removed far enough away to secure the requisite diffusion. Depending on the intensity of illumination and the character of the object, exposures vary from $\frac{1}{2}$ of a second to 10 minutes. The degree of amplification varies with the object and with the distance of the focusing screen from it. The amplification afforded at a given distance is determined by photographing, under exactly similar conditions, the lines of the micrometer slide. The manipulation of plates and holders and the developing methods are the same as in ordinary photography (q.v.). See also MICROSCOPE; MICROSCOPY.

MI'CROPYLE (from Gk. *μικρός*, *mikros*, small + *πύλη*, *pylē*, gate), in PLANTS. The ovule of seed plants differs from the megasporangium of Pteridophytes in developing an integument of one or two layers. The body of the ovule (the real sporangium), covered by the integument, has been called the nucellus. In most cases the integument is not complete around the nucellus, but is open at its tip, and this passageway through the integument is called the micropyle. Through this micropyle the pollen tube usually reaches the nucellus. In some cases the integument is complete around the nucellus, and leaves no micropyle; also in quite a number of plants the pollen tube does not enter the ovule by way of the micropyle. (See CHALAZOGAMY.) When the structures connected with the ovule have developed into a seed the position of the micropyle is represented by a scar; and in the germination of the seed the tip (hypocotyl) of the embryo usually emerges through the seed coat at the micropyle. See OVULE.

MICRORADIOMETER. See RADIOMETER.

MICROSCOPE (from Gk. *μικρός*, *mikros*, small + *σκοπεῖν*, *skopein*, to view). An instrument by which objects are made to appear of greater magnitude. Undoubtedly the oldest microscope on record is a plano-convex lens of quartz found by A. H. Layard amid the ruins of Nineveh, surrounded by articles of bronze and other materials. It is now in the British Museum, and is 0.5 cm. (less than 0.2 inch)* in thickness, 3.5 cm. (1.4 inches) in diameter, and its focal length is 10.7 cm. (about 4 inches). Many authorities believe with good reason that this lens was used as a burning glass, as similar ones were used for that purpose at the time of Socrates. On the other hand, there can be no doubt that such lenses were used as simple microscopes, or magnifying glasses, inasmuch as the apparent increase of size of an object seen through them must inevitably have attracted the attention of such good observers, and moreover the elaborate and delicate engraving on many of the seals and gems of that period furnishes sufficient evidence that some means must have been employed to aid the eye in executing this work. Spherical glass vessels filled with water would also have called attention to their employment as magnifiers; spherical drops of glass would act similarly.

During the later Middle Ages such simple lenses came more and more into use, especially as aids to the eye in ordinary vision, as spectacles. A spectacles maker of Middelburg, Holland, Zacharias Janssen, undoubtedly was the first to build a compound microscope, and about 1590 constructed such an instrument and presented it to Charles Albert, Archduke of Austria. It was nearly 6 feet long, supported upon brass dolphins on an ebony board. It contained only two lenses. Robert Hooke (1635-1703), secretary of the Royal Society, made many improvements in the construction and use of the microscope, and Divini in 1668 improved the instrument by using two plano-convex lenses as an eyepiece. (See below.) In 1686 Campani improved the form of the instrument and introduced the use of a screw for proper focusing. Nevertheless the development of the microscope took a different direction, on account of the serious difficulties with aberration (q.v.) in short-focus lenses, and under the influence of Leeuwenhoek attention was returned to the development of the simple microscope. Antony von Leeuwenhoek (1632-1723) constructed very efficient and convenient simple microscopes, developing the method already tried by Hooke and Hartsoeker of making high-power lenses by allowing a drop of molten glass to occupy a small hole in a plate of brass. Even a drop of water or oil was also used in this way. Leeuwenhoek is said to have made 247 microscopes, observing the circulation of the blood in the feet of frogs, spermatozoa, and many other interesting things. To this period belong also the names of Wilson (1708-88), Hartsoeker (1656-1724), Stephen Gray (?-1736), Jan van Musschenbroek (1687-1748), Leutmann (1667-1736), and others.

About this time Samuel Reyher (1635-1714) employed such a lens to project an image upon the wall or a screen, using the sunlight for illumination, and is thus probably the inventor of the solar microscope. Baker (1698-1774), with the aid of the mechanic Scarlett, constructed in 1736 a catoptric microscope, using mirrors instead of lenses in a manner suggested

by the Gregorian telescope. But such instruments never came to be of much importance, since Dolland (1706-61) in 1757 confirmed the theoretical conclusions of Euler (1707-83) and Klingensstierna (1698-1765) that for the same refraction the dispersion might be different, and thereupon proceeded to construct an achromatic objective, i.e., a lens in which the color effects are eliminated by the use of two kinds of glass. Nevertheless the great difficulty of grinding such small lenses with sufficient accuracy for the correction of the errors due to aberration prevented their use in a manner at all commensurate with their successful employment in astronomical telescopes.

In 1823 Selligues and Chevalier departed from the plan of using only two lenses to correct aberration and employed two or three pairs of lenses (see Fig. 6), each pair consisting of a plano-concave of flint glass, which dispersed the colors far apart, combined with a double convex of crown glass, which has a low dispersion. In this way excellent achromatic objectives were produced. In the next year Tulley of London, upon the suggestion of Dr. Goring, constructed an achromatic combination of three lenses, without knowing of the work of Selligues and Chevalier. Amici of Modena had been endeavoring to produce achromatic microscope objectives as early as 1812, and, encouraged by the success of Selligues and Chevalier, he took up the work with new energy and produced in 1827 a combination much superior to any known at that time. His work was soon rivaled by that of Andrew Ross and Powell in London. J. J. Lister, as a result of his theoretical investigations, directed James Smith in the construction of an objective that surpassed all others in the perfection of its correction, angular aperture, and flatness of field.

With these lenses A. Ross soon discovered that the presence or absence of a cover glass over the object affects the success of the correction. In other words, he discovered that the cover glass must be considered as a part of the objective system. He pointed out that its effect may be counteracted by undercorrecting the first pair of lenses in the objective and overcorrecting the other two pairs; moreover, if the distance between the first and second pairs of lenses of the objective can be varied, this makes it possible to adapt the correction of the objective to various thicknesses in the cover glass and to various kinds of cover glasses.

For a long time the best microscope objectives of high power were composed of three pairs of achromatic lenses, but Amici himself tried a single plano-convex lens next to the object and recently this has become quite popular. (See Fig. 7.) Amici also pointed out that where very short-focus lenses are used a drop of water may be introduced between the cover glass and the first face of the objective, thereby reducing the loss of light. It is, however, evident that this would affect the refraction and dispersion of the system and hence throw out the correction. Apparently Amici was never able to adapt his systems to this method of use, and it remained for Hartnack and Næchert to succeed in constructing objectives for such use and to point out their great superiority in many ways over the older form, which came to be called "dry" objectives, in distinction from this new form, which were called "immersion" objectives. The immersion system has very great advantages

over the dry on account of the gain in light by avoiding the strong reflection from the front lens in air, also because the correction of the cover glass is greatly simplified, and besides the range, or working distance, is considerably increased. Naturally a lens constructed for immersion cannot be used satisfactorily for dry work, but Powell and Lealand so arranged their objectives that by exchanging the front lens it could be changed from dry to immersion or vice versa. Wenham still further improved upon this by so constructing the system that the objective could be changed from one form to the other by simply changing the distance between the first and second elements of the system, this being accomplished by turning a screw, as in correcting for cover glasses in dry systems. See Fig. 6.

Wenham also seems to have been the first to suggest the advantage of substituting for water a liquid which should have the same dispersion and refraction as the cover glass and first lens of the objective, and it is to the zeal and energy of Zeiss of Jena, under the able guidance of Dr. Abbé, that are due the almost perfect objectives which are available at the present day. The complex form shown in Fig. 7 is due to Abbé and is known as an "apochromat"; its corrections are so perfect that it appears that the theoretically ideal conditions have been reached. Bausch and Lomb in America and Carl Zeiss in Germany are now constructing lenses under the specifications of Dr. Abbé. It should be stated in this connection that the present great success in the construction of lenses of all sorts is in large measure due to the manufacture by Schott of Jena of glass upon scientific principles, so that it is not only possible to get glass with the same optical properties in large quantities and at any time, but it has been possible to make glass with just those optical properties which are wanted for any particular purpose. Objectives designed to be used as immersion lenses, with a liquid of refraction and dispersion identical with that of the glass in contact with the liquid, are called "homogeneous" immersion lenses. Oil of cedar and oil of fennel are well adapted to use with such objectives.

Simple Microscope. A simple lens, or a combination of two or more lenses nearer together than the sum of their focal lengths, and acting as a single lens, so used as to supplement the optical system of the eye and increase the apparent size of an object, is properly called a simple microscope, or magnifying glass. The observer judges of the size of an object by the

FIG. 1.

visual angle which it subtends. For example, AB , Fig. 1, appears larger than CD because the visual angle AEB is greater than the visual angle CED . Any device which increases the visual angle which an object subtends makes it appear larger. It is impracticable to bring the object indefinitely near to the eye and thus

enlarge the visual angle, because the accommodation of the normal eye does not enable it so to adjust its optical system as to see distinctly an object much less than 20 to 25 cm. (8 or 10 inches) distant. In other words, the normal eye can bring to a sharp focus on the retina only such rays of light as are parallel or slightly divergent. If a convex lens is placed close in front of the eye and an object in front of it, and distant a little less than its focal length, as shown in Fig. 2, the lens will form a virtual

FIG. 2.

image I of the object O at $A'B'$, and the light issuing from LL is of such divergence as to be readily brought to a focus upon the retina by the lenses of the eye, and hence vision is distinct and the visual angle and apparent size of the object are increased. From a consideration of Fig. 1 it is evident that practically the apparent increase in size is approximately proportional to the decrease in distance between the object and the eye. Under the normal conditions that the distance IE , Fig. 1, is at least 20 to 25 cm. (8 to 10 inches), and we can see distinctly only a comparatively small area at once, the angle AEB is small and approximately proportional to the ratio of AB to IE , hence $AEB \div CED = FE \div IE$, and the visual angle is inversely proportional to the distance from the eye to the object. Applying this to Fig. 2 gives $A'B' \div AB = IC \div OC$, inasmuch as C is very close to the eye. IC is the distance of distinct vision and OC is practically the focal

FIG. 3. LENSES FOR SIMPLE MICROSCOPE.

length of the lens C . It is hence evident that the magnifying power of a simple lens is equal to the ratio of its focal length to the distance of distinct vision. For example, a lens of a

focal length of 1 cm. ($\frac{1}{2}$ inch) would magnify 25 cm. $\div$ 1 cm., or 25 diameters. Magnifying powers are always given in diameters, i.e., in the magnifying of any linear dimension and not of the area of the object.

Simple lenses of very short focus are not well adapted to obtaining very high magnifying power, on account of their chromatic and spherical aberrations, which render the image so colored and indistinct that accurate work is impracticable. A form of stand for simple microscope especially convenient for biological work is shown on the accompanying plate (Fig. 1). *A* is the lens or lens combination, *B* is the table for holding the object, and *D* is the mirror for concentrating light upon the latter; *C* is the rack and pinion enabling a convenient adjustment of the focus. Such instruments are useful for dissecting small organisms, and can be furnished with magnifying power up to 100 diameters. Fig. 3, above, shows several methods of obtaining strong combinations with less aberration and without the cost of elaborate correction. Fraunhofer designed the doublet *a*; *b* is a form used by Wilson; *c* is a so-called applanatic triplet by Steinheil; *e* is the original Coddington, modified to the form *d* by Brewster, and *f* is the common cylindrical lens that obtains good results on account of the slight curvature of the face nearest the object; *g* is the original Holland triplet in which the diaphragm cuts off the stray light and improves the correction greatly, a result attained in *e* and *d* by the side cuts in towards the axis. Wollaston pointed out that the improvement in using the two lenses is in the fact that the aberration of one is in large measure corrected by the other, the diaphragm serving to cut off that portion of stray light which would interfere with the distinctness of the image. The field of vision is also larger and more nearly flat than when a single lens is used.

Compound Microscope. In its simplest form as invented by Janssen the compound microscope consists of two lenses as shown in Fig. 4. The so-called objective lens *cd* forms a greatly enlarged image of the object *ab* at *a'b'*. The eyepiece *lm* is a simple microscope, or magnifying glass, and the eye of the observer is at *e*. The magnifying power of such a combination is obtained as follows: the image *a'b'* is larger than the object in the proportion of *b'c* to *ca*, and the eyepiece *lm* magnifies the image *a'b'* in the proportion of its focal length to the distance of distinct vision, 25 cm. In a particular case, suppose *ca* is 0.2 cm., *cb'* is 20 cm., and the focal length of *lm* is 2 cm. Then the image *a'b'* will be larger than the object in the proportion of 20 to 0.2, i.e., 100, and the eyepiece *lm* will magnify the image in the ratio of 25 cm. to 2 cm., i.e., 12.5, and the total apparent increase in size will be 100×12.5 , or 1250 diameters. The Huygens eyepiece, so called from its inventor, is also called a negative eyepiece, because the two lenses are too far apart to make its use possible in the same manner as other forms. The action of this eyepiece is shown in Fig. 5 and also on the accompanying plate. The objective would form an image at *aa* if it were not that the lens *ff* of the eyepiece is introduced, and consequently the combined effect is to form the image really at *bb*; this is then viewed by the eye lens *ee*. A diaphragm is interposed at *bb* to cut off stray light and improve the distinctness. *ff* is called the field lens

of the eyepiece and *ee* is the eye lens. The great advantage of this form of eyepiece lies in the fact that the chromatic and spherical aberration of the field lens *ff* is opposite and about equal to that of the eye lens *ee*. Although this lens is very satisfactory for general microscopic work it is practically little used where it is necessary to use a micrometer (q.v.) in the eyepiece, or a cross hair.

Naturally the most important optical part of the microscope is the objective, as upon its perfection depend the satisfactory results of the whole combination. In its simplest form it is only a plano-convex lens with its flat side towards the object. As usually seen it is as

FIG. 4. SIMPLE COMPOUND.

FIG. 5. COMPOUND MICROSCOPE WITH HUYGENS EYEPIECE.

shown in Fig. 6, with two or more achromatic pairs; the Zeiss objective there shown also illustrates how the cover-glass correction is accomplished by varying the distance between the first two and the last two pairs of the objective, by means of a screw *E*. Figure 7 illustrates the lenses of one of Dr. Abbé's most perfect objectives, the "apochromat." In general the eyepiece must not be astigmatic, i.e., it must be able to form a sharp image of a point. It must be orthoscopic, i.e., it must magnify all parts of the image equally. It must be achromatic, i.e., it must not show any colors not really present in the object.

The above characteristics must also be possessed by the objective even more essentially and perfectly than the eyepiece. In addition it is necessary to understand what is meant by other peculiarities of the objective. Under "aperture" is meant the angle between the limit-

ing rays of the effective beam in the formation of the image by the objective, e.g., the angle *cad* or *cbd*, Fig. 4. This is naturally affected by the index of refraction of the medium between the object and the objective, and would hence be different with the same objective if it were used dry, as water immersion, or homogeneous immersion, and consequently it has been proposed to use the product of the sine of half this angle by the index of refraction as indicating the effective aperture irrespective of the method of using the objective, and this constant is called the numerical aperture. The resolving power of an objective must not be confused with the mag-

FIG. 6. SECTION OF ZEISS OBJECTIVE.

FIG. 7. "APOCHROMAT" OF ABBÉ.

nifying power, for theoretically any desired degree of magnification can be obtained, but there is a definite limit to the resolving power set by diffraction phenomena, as pointed out by Dr. Abbé. Owing to the fact that a lens on account of diffraction is not able to form an actual point, as the image of a point, it is evident that if the little rings which are formed overlap, then no degree of further magnification can separate them, and they will confuse the vision. It has been shown that the success of an objective in gathering in all the components due to diffraction is directly dependent upon the numerical aperture. Abbé has calculated that the theoretical limit of resolving power for an aperture of 180° would be lines about 120,000 to the inch, falling to about 95,000 for 107° . This has been nearly reached in some of the best instruments. Theoretically two lines must be distant from each other at least $\lambda/2a$, in order to be seen distinctly, where a is the numerical aperture and λ is the wave length of the light.

While Abbé succeeded in increasing the resolving power of the microscope by increasing its numerical aperture a (i.e., by decreasing the value of the fraction $\lambda/2a$), Koehler attacked the problem by decreasing the value of λ . As a source of light he employed the intense *cd* line of wave length $275 \mu\mu$ lying in the ultra-violet. The entire optical system of the microscope was made of crystal quartz and the results were obtained by photography. Thus, by using light of wave length $275 \mu\mu$, which is but one-half as great as that of visible green light ($\lambda = 550 \mu\mu$), and by using an immersion of glycerin and water (thus increasing the value of a), a great increase in the resolving power was attained. Photographs of diatoms obtained by this procedure showed a wealth of detail never before observed. Another advantage to be de-

rived by this method is that different portions of a cell possess different transparency towards ultra-violet light and thus become visible in the final photograph.

In order to make use of the highest efficiency of the objective it is necessary to devote much attention to the concentration of the light upon the object in order that the image may be well lighted and also that the full aperture of the objective may be utilized. A form of condenser which is placed under the object is shown in the accompanying plate (Fig. 4); *Sp* is the mirror for reflecting the light into the condenser *S*, and the rest is mechanism for suitable adjustments. The adjoining figures show the section of such a condensing lens.

On the accompanying plate (Fig. 2) is shown a modern microscope of a high order as fitted for general and biological work. The main stand *S* is so hinged that the top may be tilted at any angle and clamped by the lever *M*. The tube *A* carries at its lower end a triple nose piece *D*, enabling the observer rapidly and easily to exchange objectives *C*, *F*, etc. In the upper end of *A* is the draw tube *B*, enabling the observer to change the distance between his objective *C* and eyepiece *E*. *LOKJ* is the stage or table on which the objects are placed. *K* is a vernier reading the angular rotation of the stage. *L* and *J* are milled heads operating the mechanical stage, making it possible to move the object regularly up and down or right and left in searching for an object in the slide, in counting, and the like. *I* is the substage condenser and its mounting, including a diaphragm. *NO* is the rack and pinion for rough adjustment of the focus and *G* is the fine adjustment, making it easy to adjust accurately the focus of a high-power objective and in some cases to make measurements.

A similar instrument, as fitted for petrographic work where polarized light is used, is also illustrated on the plate. This particular microscope is not fitted with a mechanical stage. At *P* is introduced a polarizer Nicol prism for furnishing a beam of polarized light, and another Nicol prism used as the analyzer is slid into the side of the tube at *R* or for other combinations at *S*. *U* is a rack and pinion for the adjustment of the draw tube, *B*. For some purposes the analyzer is put on top of the eyepiece at *T*. Either the polarizer or the condenser may be turned out from under the stage when not wanted. Between the objective and the analyzer is a side slot, into which may be introduced the quartz wedge, mica plate, etc., which are used in the determination of the optical constants of the minerals under study. For use in such instruments the rock to be investigated is ground to a very thin section mounted upon a glass strip, like any microscope preparation. Under these circumstances most minerals are quite transparent and the student is enabled, not only to learn the size and form of the grains, but also to subject them to an investigation under polarized light and identify their optical properties and determine completely their nature. The petrographic microscope has revolutionized the study of rocks.

There is also the binocular microscope, in which two eyepieces are used in order to secure a stereoscopic effect. (See STEREOSCOPE.) In a binocular microscope there is the usual arrangement of the objective, but one or more prisms of special design are interposed so as to deflect

some of the rays to a second eyepiece. It is unavoidable that a certain amount of light is cut off in passing through the prism, or that the path of the rays is increased so that where the highest powers are employed the binocular is not used.

There are used in connection with the microscope many forms of the "camera lucida" (q.v.), a device to enable the operator to make a drawing of the object under study by tracing over the virtual image which he seems to see on the paper, as the eye of the observer sees both the light which comes up from the object and that which comes from the paper and pencil below the microscope. In preparing slides for work in microbiology it is necessary that the material should be in very thin sections, and this is accomplished by embedding the whole object in paraffin and then shaving off thin sections with a microtome, one form of which is shown on the accompanying plate (Fig. 8). Afterward the paraffin is removed and the shaving mounted upon a glass slide. These preparations are usually hardened by chemicals, and are frequently dyed with special solutions, which may, e.g., color the nerves and not the other parts, thus bringing out the contrast and assisting the work. Under some circumstances the object is frozen by means of liquid carbonic acid gas and then shaved in sections. It should be evident that by a simple device a camera may be made to take the place of the eye in any of the above cases, and by that means photographs may be taken of the objects under investigation.

Perhaps the most important development in the field of microscopy in recent years is the ultramicroscope. This instrument is due to Siedentopf and Zsigmondy, who had at their disposal the facilities of the Zeiss optical works. The principle upon which this instrument operates is as follows: on the basis of Abbé's theory a perfect microscope will separate distinctly two points in the object studied having a linear separation equal to $\lambda/2a$, where λ is the wave length of light used and a is the numerical aperture of the objective. If now we consider a particle which is small in comparison to $\lambda/2a$ it is evident that the microscope will no longer yield a correct delineation of the true form of this particle but will, instead, show a central diffraction disk surrounded by concentric bright and dark rings. As a matter of fact such a particle will be invisible under usual illumination, owing to the glare of light entering the eye. In order to overcome these difficulties Siedentopf and Zsigmondy illuminated the small particles laterally in such a manner that none of the light coming from the condenser would enter the objective directly. Each minute particle thus illuminated scatters light in all directions and hence throws some light upward into the microscope. Upon looking into the microscope the observer sees a number of diffraction disks upon a black background. In other words, the principle is similar to that which enables one to see the dust in the air of a darkened room through which a narrow beam of sunlight is passing. This mode of illumination has been termed "dark-field illumination." Many types of condensers have been devised to accomplish this purpose, the more important types being due to Wenham, Stephenson, Ignatowsky, and Siedentopf and Zsigmondy. The best by far, however, is the "cardioid" con-

denser developed by Siedentopf himself. A sectional drawing of this condenser is shown in Fig. 8.

FIG. 8. SECTION OF "CARDIOID" CONDENSER.

A system of parallel rays AA , after passing through an annular opening in a diaphragm, is reflected from the convex surface of a sphere BB , suffers a second reflection at the concave surface of the cardioid CC , and is finally united in a point at P . It is evident that the rays, after passing through P , cannot enter the microscope objective on account of their great inclination.

A microscope supplied with a condenser producing dark-field illumination is appropriately termed an "ultramicroscope," and the objects thus made visible are termed "ultramicroscopic particles." Of the latter the variety is extremely great. Their dimensions lie between that of the wave length of light and of individual molecules. Characteristic ultramicroscopic bodies are colloidal gold in ruby glass, colloidal silver (Carey Lea's solution), gelatins, albumens, etc. While the size of the diffraction disks due to larger and smaller particles in the same field of view is the same, their intensities differ tremendously, for the intensity of the light scattered is proportional to the square of the linear dimension. Upon this basis a rough determination of the size of the particles may be carried out. The most accurate method, however, consists in ascertaining in advance the mass of the total number of ultramicroscopic particles; then, by counting the number contained in a minute volume of known dimensions and by determining the total volume through which the particles are spread, the average mass of the individual particle may be ascertained. Since, as previously stated, the intensity of the scattered light varies with the square of the linear dimension, eventually a particle, when sufficiently small, will scatter so little light that it is no longer visible. The smallest particles of colloidal gold thus far seen have dimensions of the order of 4 to 7 μ , where $1 \mu = \frac{1}{1,000,000}$ millimeter.

Bibliography. For the early history of the microscope, the reader should consult Gerland and Traummüller, *Geschichte der Experimentierkunst* (Leipzig, 1899). Drude, *The Theory of Optics*, translation by Mann and Milikan (New York, 1902), and Czapski, *Grundzüge der Theorie der optischen Instrumente* (Leipzig, 1904), treat the theoretical side. A practical and complete treatise is W. B. Carpenter, *The Microscope* (8th ed., ed. by Dallmeyer, Philadelphia, 1901). The more modern developments of the microscope are described in the following articles: Siedentopf and Zsigmondy, "Ultra-mi-

kroskop," *Annalen der Physik*, vol. x (1903); A. Köhler, "Eine mikrophotographische Einrichtung für ultra-violettes Licht ($\lambda = 275 \mu$)," *Physikalische Zeitschrift*, vol. v, p. 666 (1904); Siedentopf, "Kardioidkondensor," *Berichte der deutschen physikalischen Gesellschaft*, vol. viii (1910). See MICROSCOPY, CLINICAL.

MICROSCOPE, SOLAR. See SOLAR MICROSCOPE.

MICROSCOPICAL SOCIETY, THE AMERICAN. An association organized in 1878 and incorporated in 1891, at Washington, D. C. It has a membership of 400. Its objects are the encouragement of microscopical research and the diffusion of knowledge on the subject of microscopy. The society published 34 volumes of *Transactions*, which are now issued as a quarterly journal of microscopy. The Spencer-Tolles Research Fund in 1915 amounted to \$5000. Its income is used to stimulate research in microscopic subjects.

MICROSCOPY, CLINICAL. With the rapid increase made in comparatively recent times in the perfection of instruments at our disposal and in our knowledge of the differences in normal and pathological appearances of body tissues and organs and their products, the microscope has come to be an indispensable adjunct to medical diagnosis. (See the article MICROSCOPE for description and illustration of microscopes.) For most diagnostic work two objectives are sufficient—a low power having a focal length of about two-thirds of an inch and a high power having a focal length of about one-fifth of an inch. For a microscopic examination of bacteria and the blood a higher magnification is in many cases desirable.

Before examining with the microscope most specimens require some special preparation. As these preparations differ for different specimens, they will be described under separate headings.

Urine. Microscopic examination of the urine is made for the purpose of determining disease

as a cover glass. The specimen may then be examined.

Crystalline Substances.—(a) Uric acid occurs as whetstone-shaped crystals. These lying across one another in groups form radiating masses or rosettes. Crystals somewhat dumb-bell in shape are less common, and after the addition of acid to urine large platelike crystals of uric acid may

CRYSTALS OF CALCIUM OXALATE $\times 350$.

be found. (b) The salts of uric acid, or urates, may also be seen, usually as a granular deposit—amorphous urates. In urine which is undergoing ammoniacal fermentation ammonium urate crystals occur either as clumps of short thick needles or as rough spherical crystals. (c) Hippuric acid crystals are rather infrequently found in acid urine. (d) Phosphates, ammonium magnesium or "triple phosphate" crystals, occur in slightly acid and in alkaline urine. They are large and are usually described as "coffin lid" in shape. In alkaline urine the phosphates sometimes come down as fine feathery crystals. Calcium phosphate occurs as clear, slender, needle-shaped crystals. Large colorless platelike crystals of basic magnesium phosphate and granular deposits of the basic phosphates of lime and magnesium may also be found in alkaline urine. (e) Calcium oxalate crystals occur in acid urine. They are clear and diamond or envelope shaped. Less common are crystals of a somewhat dumb-bell shape. (f) Calcium carbonate is found in alkaline urine which is undergoing fermentation. It occurs as coarse granules

CRYSTALS OF CALCIUM PHOSPHATE $\times 150$.

of the kidney, ureter, bladder, and urethra. For microscopic examination the specimen should be allowed to stand for from eight to twelve hours and the sediment taken by means of a pipette from the bottom of the fluid; or the urinary solids may be precipitated at once by means of a machine called the centrifuge. A small drop of the sedimented urine is placed upon a glass slide and covered by a thin piece of glass known

EPITHELIAL CELLS.

a, round; b, columnar; c, squamous.

which dissolve with gas formation on the addition of acetic acid. (g) Less common crystals found in urinary sediments are those of bilirubin, hæmatoidin, leucine, tyrosine, and cystine.

Organic Substances.—(a) Epithelial cells, mainly from the bladder and vagina, occur in normal urine. In inflammatory conditions of

the bladder and vagina their number is greatly increased. Epithelium from the kidney is cuboidal or columnar in shape and most abundant in degenerative conditions of the kidney and in pyelitis. Pigmented columnar epithelium

CASTS.

a, hyaline; b, waxy; c, hyaline and granular; d, hyaline and epithelial; e, hyaline and blood; f, hyaline and pus.

from the seminal vesicles may sometimes be found. (b) Casts are among the most important of the organic substances found in urine, indicating parenchymatous inflammation of the kidneys. They are formed by the coagulation of albuminoid matter in the tubules of the kidney. Casts almost clear composed of albumin and a few fine granules are known as hyaline casts.

CRYSTALS OF CYSTIN.

Occurring in small numbers hyaline casts may be of little significance, being present in functional albuminuria, in the urine of old persons, and often in urine otherwise normal. In chronic inflammation of the kidney these casts occur in large numbers. So-called "waxy" casts are less transparent than the hyaline and turn brown

CASTS.

a, fine granular; b, coarse granular; c, epithelial; d, blood; e, pus; f, fatty.

when subjected to the action of iodine. They are characteristic of the waxy degeneration of the kidney which sometimes accompanies chronic nephritis. Casts containing epithelial cells are known as epithelial casts. They are associated with acute disease of the kidney. Blood casts,

or casts containing red blood cells, are found in urine in cases of acute exudative nephritis and in connection with the hemorrhages which sometimes occur. Casts containing pus cells are found in suppurative nephritis and in some of the more severe cases of acute nephritis. Casts containing fine or coarse granules are of frequent occurrence.

Pus cells are found in the urine in the more severe forms of acute nephritis and in suppurative inflammation of any part of the genito-urinary tract. Pus is most abundant in cystitis; less abundant and more thoroughly mixed with the urine in pyelitis; least abundant, and confined mainly to the first part of the specimen passed, in urethritis.

Red blood cells appear as round biconcave disks, about 7 micromillimeters in diameter.

HUMAN SPERMATOZOA GREATLY MAGNIFIED.
a, view of broad surface; b, view of profile.

They may be found in severe acute inflammations of the genito-urinary tract and in conditions determining hemorrhage along the tract.

Spermatozoa are frequently found in the urine of healthy individuals. Constant presence of spermatozoa in the urine may occur in certain diseases of the prostate and seminal vesicles. The condition is also frequently present in sexual neuroses.

Yeast and mold plants are frequently found in the urine of diabetics, more rarely in other conditions.

Bacteria.—Normal urine in the normal bladder contains no bacteria. Nonpathogenic bacteria are, however, frequently added to the urine from the urethra or from the external genitals. Of these the *Micrococcus ureæ* is one of the most common. The smegma bacillus is also sometimes present in large numbers and is important from the similarity which it bears to the tubercle bacillus as regards its staining qualities. Among pathogenic bacteria found in urinary sediments may be mentioned the *Staphylococcus pyogenes*, *Streptococcus pyogenes*, the colon bacillus, tubercle bacillus, and gonococcus. In such infectious diseases as septicæmia, pyæmia, erysipelas, diphtheria, and tuberculosis the specific germ of the disease is sometimes found in the urine. For descriptions of the appearance which these different germs present under the microscope the reader is referred to the special articles on the diseases which they cause. For a description of the staphylococcus and streptococcus the reader

is referred to the article on BACTERIA. In examining urinary sediment for bacteria a small amount of the sediment is taken up with a platinum loop and smeared on a cover glass in a thin layer. This is allowed to dry. To fix the specimen, the cover glass is passed through a blue flame of sufficient heat to bring the specimen just to the boiling point of water. The specimen may now be stained by placing upon it a few drops of a watery solution of fuchsin, gentian violet, or methylene blue. After staining it is washed in water and may then be examined.

For other organisms more rarely present in urine the reader is referred to special works upon microscopical urinalysis.

Blood. The main purposes for which blood is examined microscopically are as follows:

1. To count the red blood cells.
2. To determine the amount of hæmoglobin in the red cells.
3. To determine the size, shape, etc., of the red cells and the presence of abnormal forms, e.g., nucleated red blood cells.
4. To determine the number of white cells.
5. To determine the relative proportion of the different kinds of white blood cells—"differential count of leucocytes."
6. For the *Plasmodium malarix*.
7. In suspected typhoid for Widal's reaction and other agglutination tests.
8. For bacteria and other foreign substances.

For description of the normal histology of blood the reader is referred to the article on BLOOD.

Counting the Red Blood Cells.—This is best accomplished by means of Thoma's hæmatocytometer or blood-counting apparatus. This consists of a pipette with bulb and graduated capillary tube. The graduation of the tube is 0.5 and 1, that of the bulb and tube together 100. By filling the tube to mark 1 with blood and then the bulb and tube to mark 100 with an inert diluting fluid such as normal saline, a dilution of 1 to 100 is obtained. The counting slide has in its centre a round chamber, in the centre of which is a raised flat glass surface which is marked off into 400 equal squares, each of which is one four-hundredth of a square millimeter. The surface of the marked-off area is just one-tenth of a millimeter lower than the surface of the rest of the slide. A drop of the diluted blood is placed upon the centre of the graduated area and a flat cover glass placed over it. As will be seen, the amount of fluid over one of the small squares is one-tenth times one four-hundredth or one four-thousandth of a cubic millimeter. The number of cells in one square is then counted. This multiplied by 4000 and then by the dilution, 100, gives the result desired, i.e., the number of red cells in one cubic millimeter of blood examined. In actual practice a large number of squares is counted and the average taken. The white blood cells may be counted in the same specimen if desired. Owing, however, to their smaller number a larger number of squares should be counted to avoid error. For determining the richness of the individual corpuscles in hæmoglobin, the shape and size of the cells, the relative number of the different kinds of white cells, the presence of the malaria plasmodium, etc., the preparation of fixed and stained specimens is required as follows. Blood from a needle prick is taken up on the end of a glass slide and this is drawn across the surface of a second slide, thus making a

thin "smear" of blood. This is dried quickly in the air, after which it is "fixed" by equal parts of alcohol and ether, the vapor of osmic acid or of formalin, or by subjecting to the action of dry heat. The specimen is now ready for staining. A combination of eosin and methylene blue, and Ehrlich's triacid stain, are the most satisfactory. After staining the specimen is washed in water. The eosin-methylene blue method is the most satisfactory for general purposes and stains the malaria plasmodium. Ehrlich's stain is most satisfactory for making a differential count of the leucocytes.

Persistent marked reduction in the number of red cells occurs in primary pernicious anæmia and in the severe secondary anæmias due to some of the infectious diseases. It may also be due to the action of certain mineral poisons (phosphorus, arsenic, etc.), to long-continued suppurative processes, cancer, malaria, conditions of malnutrition, etc.

Loss in the hæmoglobin content of the individual cells occurs especially in that form of anæmia known as chlorosis. Moderate diminution in number of cells may also occur. In leucocythæmia there may also be both a reduction in the number of cells and a reduction in hæmoglobin content. This loss of hæmoglobin on the part of the individual cell is shown in the eosin-stained specimen by an increase in the clear central area of the cell.

Irregular red cells (poikilocytes), small red cells (microcytes), and large red cells (megalo-cytes) are found in severe anæmias whether primary or secondary.

Nucleated red blood cells are found in all forms of anæmia. As they represent develop-

HUMAN RED BLOOD CORPUSCLES AND TWO LEUCOCYTES.

mental types, their presence may be construed as an attempt on the part of nature to replace lost cells. Very large nucleated red cells (megablasts and giantoblasts) are sometimes present in severe anæmias.

Moderate increase in the number of white blood cells occurs physiologically during the first few days after birth, in the later months of pregnancy, and after eating. Pathological increase in the number of white cells occurs in many of the infectious diseases, especially those accompanied by exudation or suppuration. It is notably absent in typhoid, typhus, tuberculosis, measles, and malaria. Lymphocytosis, or increase in the number of lymphocytes, is

frequent in the later weeks of typhoid, in anæmia, in intestinal diseases of children, and in lymphatic leucocythæmia. Persistent increase in the number of white blood cells independent of other lesions is characteristic of leucocythæmia. This increase may be very great, and is usually irregular, i.e., the proportionate numerical relation of the different kinds of white blood cells is changed. In lymphatic leucocythæmia the greatest increase is in the lymphocytes. In myelogenous leucocythæmia the increase in leucocytes is often enormous, sometimes more than a million per cubic millimeter. Abnormal forms of leucocytes also appear.

In patients suffering from malaria the *Plasmodium malarie* may be found. The forms which the organism assumes are known as tertian, quartan, and æstivo-autumnal. They occur within the red blood cells, rarely in the plasma.

Free pigment is sometimes found in the blood. This condition is known as melanæmia.

Various foreign bodies, such as fat, bacteria, animal parasites (*Distoma hæmatobium*, *Filaria sanguinis hominis*, and the eggs of the trichina and echinococcus), endothelial cells, pus cells, tumor cells, etc., are sometimes found in the blood.

Examination of the blood in typhoid for the so-called Widal reaction should be mentioned. The blood or serum to be examined is mixed with ten times its amount of a 24-hour-old broth culture of the typhoid bacillus and examined under the oil immersion lens. A positive reaction consists in the rendering motionless of the bacilli and their collection into groups. If a reaction with the one-to-ten dilution occurs, a one-to-twenty should be tried. Positive reaction with the one-to-twenty dilution makes the diagnosis of typhoid extremely probable. A negative result is of less value.

Stains may be examined to determine the presence or absence of blood, as follows. A drop of normal saline solution to which a few scrapings from the stain have been added is evaporated on a glass slide. This is then covered and a drop of glacial acetic acid allowed to run under the cover. The preparation is next heated until it bubbles. More acid is added and the slide heated until a brownish color appears. The specimen is then slowly dried and mounted in glycerin. If any blood was present it is shown by the presence of small rhombic crystals which result from the conversion of hæmoglobin into hæmin. In cases of suspected rape stains from the clothing or smears from the vagina are examined for the presence of spermatozoa.

Fæces may be examined by mixing a small amount with a drop of normal saline solution on a glass slide and covering with a cover glass. Detritus from incomplete digestion of food forms a large part of normal fæces. Thus, it is common to find in a specimen of fæces vegetable cells of various kinds, starch granules, muscle fibres from meat, fat globules, coagulated albumins, etc. In addition to these there are usually found mucus and epithelial cells, and not infrequently crystals of calcium oxalate, calcium phosphate, calcium sulphate, the fatty acids, triple phosphates, cholesterin, etc.

Epithelial cells in large numbers are frequently associated with intestinal catarrh, especially in children.

Red blood cells may be found in conditions associated with hemorrhage. In suspected cancer or ulcer of the stomach or intestines the

search for evidences of "occult hemorrhage" is extremely important.

Pus cells are frequent in catarrhal inflammations of the bowels. They are more abundant when the inflammation is suppurative in character. In typhoid fever and other ulcerative

BACTERIA $\times 500$.

conditions bits of an ulcer which has sloughed or groups of epithelium with pus cells attached may be found in the fæces.

A great variety of bacteria are present in normal fæces. Some of these gain entrance with the food; others exist normally in the gastrointestinal canal. Among these may be mentioned the *Bacillus coli communis*, *Proteus vulgaris*, *Leptothrix*, and the *Bacillus lactis aerogenes*. Under certain as yet little understood conditions it appears that some of these microorganisms may assume a pathological significance.

The typhoid bacillus occurs in the stools of persons suffering from typhoid fever.

Tubercle bacilli may be found in the fæces. (For method of staining, see TUBERCULOSIS.) Occurring with pulmonary lesions and without intestinal symptoms, their source is usually in swallowed sputum. If, however, symptoms of enteritis are associated with tubercle bacilli in the stools, there is certainly a strong probability that the enteritis is tubercular.

The "comma" bacillus is present in the stools of persons suffering from Asiatic cholera.

The *Amæba coli* is found in the fæces in amæbic dysentery. It is best to examine stools for amæba as soon as possible after their passage and on a warm stage, as their motility is a valuable aid in their detection. The presence of hookworm and many other intestinal parasites can only be certainly determined by a microscopical examination of the fæces.

Sputum is examined microscopically to determine the character of the secretion of the respiratory tract. It may be examined by smearing on a cover glass or slide, fixing, and staining with dilute aqueous solution of methylene blue. If there are little lumps of cheesy matter scattered through the sputum, it is well to select one of these from which to make the smear, especially if the tubercle bacillus is to be looked for. Photographs of typical bacteria as seen through the microscope are shown in the article DISEASE, GERM THEORY OF.

Epithelial cells from various parts of the

respiratory tract are often present. Their origin can frequently be determined by their appearance.

Red blood cells occur in the sputum in acute bronchitis, pneumonia, tuberculosis, and in any condition associated with hemorrhage into the respiratory tract.

White blood cells are also readily recognized in methylene blue stained specimens by their irregular or multiple nuclei and their unstained cell bodies. They are found in acute and chronic bronchitis, in pneumonia, tuberculosis, abscess, and gangrene of the lung, in fact in any inflammatory condition of the respiratory tract characterized by a catarrhal or suppurative exudation.

Mucus, fat droplets, fibrin, elastic fibres, crystals of calcium carbonate, triple phosphates, cholesterin, the fatty acids, and the so-called Charcot-Leyden crystals may be found in sputum on microscopical examination.

A large number of harmless species of bacteria are found in sputum, most of these being

gan. Material is obtained as vomitus or by introducing the stomach tube. Incompletely digested food may be recognized as muscle fibres, fibrous and elastic shreds, fat, starch, and various kinds of vegetable cells. Epithelial cells

MOLD PLANTS $\times 100$.

YEAST $\times 250$.

derived from the mouth, nose, and upper respiratory tract. Of disease-producing species the most important are the tubercle bacillus, the bacillus of influenza, the pneumobacillus of Friedländer, the pneumococcus, the streptococcus, and the staphylococcus. (For the staining qualities and appearance of the tubercle bacillus, see article on TUBERCULOSIS.) The bacillus of influenza is an extremely minute bacillus measuring only about half the length of the tubercle bacillus. It is apt to occur in clumps and does not stain very readily with methylene blue. A rather weak solution of carbol-fuchsin, however, gives good staining of the microorganism. The bacillus of Friedländer is the less common of the pneumonic organisms. It is capsulated and decolorizes by Gram's method of staining. The more common cause of pneumonia, the *Pneumococcus* or *Diplococcus lanceolatus*, is also surrounded by a capsule, but is shorter than the Friedländer bacillus and does not decolorize by Gram's method. For the appearance of certain germs, see DISEASE, GERM THEORY OF.

The "ray" fungus, or fungus of actinomycosis of the lung, is sometimes demonstrable in the sputum, as are also yeasts, molds, and *Leptothrix*.

Stomach Contents. Microscopical examination of specimens from the stomach is often of value in determining the condition of that or-

gan. Material is obtained as vomitus or by introducing the stomach tube. Incompletely digested food may be recognized as muscle fibres, fibrous and elastic shreds, fat, starch, and various kinds of vegetable cells. Epithelial cells from the mouth or oesophagus or from the stomach itself may be found. Red blood cells may come from the stomach or may have been swallowed. White blood cells are quite commonly found. The condition of the stomach may sometimes be determined by the forms of microorganism which are found growing there. Thus, a long bacillus which occurs in chains, the so-called Boas-Oppler bacillus, is a common inhabitant of a stomach free from hydrochloric acid, the contents of which are undergoing lactic-acid fermentation. The *Sarcinae*, on the other hand, a species of cocci which hang together in cubes of eight, sixteen, thirty-two, etc., occur in exactly opposite gastric conditions, i.e., where

PUS CELLS.

a, natural condition; b, after the addition of acetic acid.

hydrochloric acid is present and lactic acid is absent. Yeasts, molds, and *Leptothrix* are also found.

Exudates. *Serous exudates* usually show little of diagnostic import. After standing or after centrifuging the sediment may show some epithelial cells, red blood cells, leucocytes, fat globules, cholesterin crystals, etc. Bacteria, if

present, are usually in such small numbers as to require culture for their recognition. Fairly frequently, however, the gonococcus may be found in the exudate of gonorrheal arthritis, by simply staining the sediment. Less frequently the tubercle bacillus may be identified in a similar manner.

Purulent exudates when examined under the microscope show large numbers of pus cells which are mainly polynuclear leucocytes. Red blood cells and exfoliated epithelium are also often present. Of bacteria may be mentioned the tubercle bacillus, the bacillus of anthrax, the diphtheria bacillus, the streptococcus, staphylococcus, gonococcus, and pneumococcus. For methods of examining for tubercle bacillus, see article on TUBERCULOSIS; for streptococcus and staphylococcus, see article on BACTERIA; for pneumococcus, see PNEUMONIA.

The diphtheria or Klebs-Löffler bacillus may be found in sputum. For examination it is usually, however, obtained directly from the suspected membrane. See DIPHTHERIA.

Leptothrix and *Oidium albicans* are organisms sometimes found in exudates associated with diseases of the mouth and pharynx. The former is not infrequently the apparent cause of very obstinate pharyngitis, while the latter is found in connection with the disease known as thrush.

Tissues and Organs. The examination of pieces of tissue or of organs for the purpose of determining the nature of the disease affecting them is often of great importance.

Some tissues may be examined in the fresh state by simply teasing apart in such an inert fluid as normal saline solution ($\frac{1}{4}$ per cent aqueous solution of sodium chloride). The satisfactory examination of most tissues requires, however, a more or less elaborate preliminary preparation. This consists in (1) fixing, (2) hardening, (3) embedding, (4) section cutting, (5) staining, and (6) mounting.

1. *Fixing.*—This consists in placing the tissue, as soon as possible after its removal, in a solution which will kill the tissue elements rapidly, so that they retain the same form and structure that they had during life. Of the most commonly used fixing agents may be mentioned alcohol; formalin, in aqueous solutions of from $2\frac{1}{2}$ to 10 per cent; and Müller's fluid (potassium dichromate, 2.5 grams; sodium sulphate, 1 gram; water, 100 cubic centimeters).

2. *Hardening and Preserving.*—After fixing, tissues are thoroughly washed in running water and then hardened in graded alcohols, i.e., first in 50 per cent, then in 60 per cent, then in 80 per cent. For permanent preservation they are usually left in 80 per cent alcohol.

3. *Embedding.*—This is for the purpose of impregnating the tissues with some substance which will hold them together during the subsequent manipulations. The now most commonly employed embedding mass is celloidin, although for special purposes paraffin is used.

4. *Section Cutting.*—This is now accomplished by means of an instrument known as a microtome. While many of these instruments are quite complicated, the purpose of them all is to carry a knife through the specimen in such a way that sections of any desired thickness may be obtained.

5. *Staining.*—Sections may be stained in a great variety of ways. For general purposes what is known as double staining gives satisfactory pictures. This is accomplished by stain-

ing the specimen first in a watery solution of hæmatoxylin and then in an alcoholic solution of eosin. The specimens are next placed in oil of origanum, which removes the alcohol and renders the sections more transparent ("clearing").

6. *Mounting.*—From the oil the section is transferred to a glass slide, the excess of oil removed by blotting with filter paper, a drop of Canada balsam placed on the specimen, and the whole covered by means of a cover glass. This makes a permanent mount.

For other methods of staining and mounting the reader is referred to special textbooks on histology and histological technique.

MI'CROSOME (from Gk. μικρός, mikros, small + σῶμα, sōma, body). A name given to minute granules which occur in protoplasm.

MI'CROSPORANGIUM (Neo-Lat., from Gk. μικρός, mikros, small + σπόρος, sporos, seed + ἄγγειον, angeion, vessel, from ἄγγος, angos, jar). When spores become differentiated in size (heterospory, q.v.) the two kinds are produced by different sporangia, and the sporangium producing microspores is the microsporangium. In heterosporous Pteridophytes the microsporangia and megasporangia do not differ in appearance, but differ in the number and size of the spores produced. Among the seed plants, however, the microsporangia are the so-called pollen sacs borne by the stamens. See HETEROSPORE; SPORANGIUM.

MI'CROSPORE (from Gk. μικρός, mikros, small + σπόρος, sporos, seed). In certain Pteridophytes and in all seed plants two kinds of spores are produced, which differ in size, the smaller being the microspores. In germination a microspore produces a male plant, which is so small that it does not escape from the spore. In the flowering plants this male gametophyte usually consists of three cells or nuclei, and in this same group the microspores have long been called pollen grains. See ALTERNATION OF GENERATIONS; HETEROSPORE; SPORE.

MI'CROSPOROPHYLL (from Gk. μικρός, mikros, small + σπόρος, sporos, seed + φύλλον, phyllon, leaf). In those plants which produce megasporangia and microsporangia (q.v.) the sporangia are borne upon foliar structures called sporophylls. The sporophylls bearing the microsporangia are microsporophylls, which in the flowering plants have long been known as stamens. See HETEROSPORE; SPOROPHYLL.

MI'CROTASIMETER (from Gk. μικρός, mikros, small + τάσις, tasis, extension + μέτρον, metron, measure). An instrument invented by Thomas A. Edison in 1877 for the purpose of measuring very minute variations of temperature or moisture. The action of the apparatus depends on the effect which the pressure of an expanding rod has upon the electrical resistance of a piece of carbon placed in the circuit of a galvanic battery. A rod of vulcanite is used as the expanding element when it is desired to em-
